CALIFORNIA FORESTS

California has over 28,000,000 acres, or over one-fifth of its total area, under forest cover. Much of this land is finely timbered, and, with forest management, will be increasingly valuable for the wood which it can supply. But in California the forests have another use, which, as is well understood in this State, is even more important than the production of timber, to conserve the water supply. The wonderful agricultural development which irrigation has made possible is perhaps the largest fact in California's recent economical history. Because of the need of water and the fear of floods public sentiment in favor of forest protection has always been well in advance of that in other States.

The Two Best Spray Nozzles

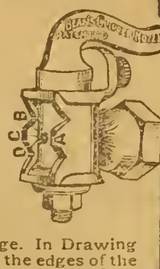
The Bean Cyclone Long Distance Spray Nozzles

ARE EASILY CLEANED by simply jabbing against a limb which throws the cap back onto a steel needle. The pressure instantly returns the cap to position.

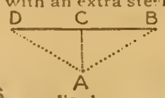
MAKE A BEAUTIFUL SPRAY with **great penetrating force** because there is no abrupt bend in the nozzle to retard it.

ARE LIGHTEST on the end of the rod; **SIMPLEST** and **MOST DURABLE** because one cap will last as long as 5 or 6 of the ordinary kind.

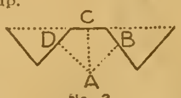
HAVE NO SPRINGS or cumbersome parts to catch in the limbs. Packed one in a box with an extra steel cap.



Bean Clipper Nozzles



No. 1



No. 2

throw a broad, fan shaped spray with practically no waste or drippage. In Drawing No. 1 notice it is nearly twice as far from the discharge hole A to the edges of the nozzles at B and D as from A to C. This adds so much friction to the outside edges of the spray that they fall short and **are wasted.**

In Drawing No. 2 it is an equal distance from the discharge hole A to all of the points B, C and D. Hence all are treated alike and a **perfect spray results.**

BEAN CLIPPER and BEAN CYCLONE NOZZLES can be secured of your hardware dealer or will be sent postpaid on receipt of $1.00. We also manufacture Vermorel and Side Cyclone Nozzles. Catalogue No. 16 describing Hand Pumps or No. 18 describing Power Sprayers sent free upon request

YOUR FORTUNE

BEGIN IT WITH THE NEW YEAR

The old year is about past—figure up what you have earned last year. How much has each hen earned for you on an average? Say you have 2,000 hens, a small flock—and you have earned $2,500 from them during the year. You still have 2,000 hens—are you going to be contented to go through another year and not make any more money than you did the past year?

Wake Up! Think! Get an Ambition!

Two thousand laying hens next year can be made to earn for you

$5,000.00.

Is it worth striving for? Would you appreciate it if some one would put you wise and tell you how?

"Where there's a will there's a way." The man who has a flock of 6,000 laying hens should earn this coming year

$15,000.00.

SEE HERE! You can get Mr. A. R. Coulson to prepare for you a solution to be combined in the mixture called Coulson's Egg Food—a feed of the choicest and richest kind, and you can feed this to the laying hens every day for one year, and also all the wheat and other grain to go with it, also including all extras; and all it will cost you on an average to feed the hens for one year, will be $1.25. You can feed them for 90c if you want, but this $1.25 worth of feed per hen coupled with good care, will make the hens average 180 eggs per hen. We are talking about the whole flock now—individual hens may produce 300 eggs.

Taking the average price of 27c per dozen, last year's average at Petaluma, 180 eggs would be worth $4.05, deducting the $1.25, leaves $2.80 per hen profit.

We do, others are doing it, YOU can do it.

Strengthen and develop the egg organs of the hen and make her a wonderful layer.

Correspondence solicited.

Stories From Life

The Poor Sucker Hadn't Any Brains

A minister (?) was telling the congregation about a fellow that went fishing. He said the man, in order to catch the fish, put whiskey on the bait, and lo! all the fish bit, but one, and the man thought that must be an awful wise fish that didn't bite. The fisherman was more anxious than ever to get the othre fish, to see what was wrong with it, and he finally ensnared it. Then he examined, and found that **THE POOR SUCKER DIDN'T HAVE ANY BRAINS.** No wonder he didn't bite!

Pick Up the New Ways

It's a good thing that people don't live to be too old, for some people are apt to get set in their ways, and want to do now just as things were done fifty years ago. They forget that the world is continually advancing, and if you don't pick up new ideas and new methods, you are sliding backwards, for you can't stay still—it's either forwards or backwards. Which way are you going?

Three Kinds of Fools

The ring master told the clown he was a fool. The clown replied there were three kinds of fools. He was one for money. Then there is one fool to be pitied, the one who was not bright, naturally. But the greatest fool is the man who knew it all, and every one holds that man in contempt.

Ignorance Keeps Back Progress

Fulton went to Napoleon and told him about his invention of a steamship, to take his many men across the water, instead of the long, disastrous journey by land. Napoleon thought itimpossible for ships to go without sails, so he wouldn't make use of Fulton's proposition. If Napoleon had only listened to Fulton, he might have conquered all Europe, and the world's history today would have been different.

Intelligence Recognizes and Takes the Opportunity—Makes Wealth and Prosperity

When Bessemer talked to a committee of English Iron Manufacturers, he tried to persuade them that he had an improved method of making steel. They listened to him a while, and then said, "Oh, pshaw! it's all nonsense; we are making steel good enough as it is." So they turned down Bessemer's proposition. But Bessemer, afterwards, got other men interested, and made millions of dollars The English Iron Makers might all have been millionaires, if they had taken up Bessemer's proposition; but as they didn't, they died comparatively poor men.

* * * * * * * * * * * * *

To climb up the ladder of success, one should take advantage of **EVERY** opportunity.

Don't Be Too Suspicious

"You can't fool me," says the man who THINKS HIMSELF WISER than others. The worst thing about the suspicious man is that he prides himself on the very qualities most FATAL TO HIS SUCCESS IN LIFE.

Many human beings unfortunately, are born with a suspicious nature. There are thousands of men making failures of their lives, who could make great successes, if they could only get rid of their suspicious natures.

Don't try to hog it all—give some one else a chance to make a little and you will prosper ten times better. Remember, that it is only IGNORANCE that KEEPS BACK PROGRESS—it takes intelligence to recognize the golden opportunities.

Wake Up—Do Something

"If I should buy everything that came along, I'd be broke," that's the greatest mistake of all. In trying to keep from buying these things, nine times out of ten, you keep away **OPPORTUNITY.** Believe every man a friend, until he proves himself otherwise.

Don't Try to Get Along Without It

Life is too short—what's the use to deny yourself things which you might and should have.

There is no doubt but what you can get along without Coulson's Foods, but that would be SELF DENIAL, and it would be a FOOLISH SELF DENIAL; for you can just as well have Coulson's as not. It will not cost you any more to feed Coulson's than what you are feeding now, and think of the great convenience it is to have the feed already mixed for you, so as to save you all the bother of mixing.

You will feel better, be **MORE PROSPEROUS** and **MORE PROGRESSIVE**, if you have it. Then get it. It takes a real genius to say "yes."

What Do You Say?

Breeding the General Purpose Horse

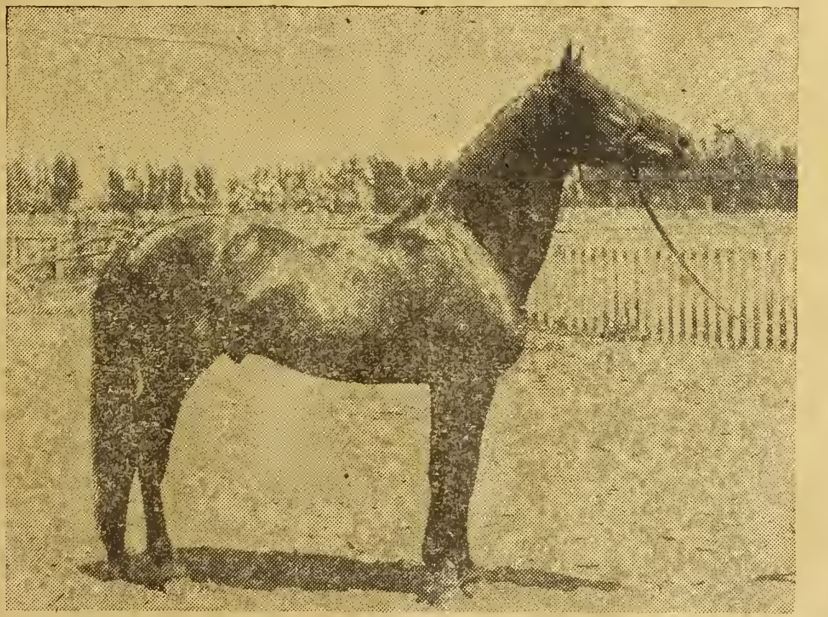
By W. A. Bates, Diuuba, Cal.

"As to the breeding and marketing of an army horse, I am going to assume in the first instance that there is an animal designated as the horse, and second, that there are several different breeds of horses; but among all of the breeds, whether on this or on other continents, there is but one thoroughbred horse. Since the invention of gun-powder there has been and is now a demand for a different type of horse than that usually found. The thoroughbred horse will not and cannot fill the requirements, his general contour, size and disposition are not in harmony with the requirements that are to be sought for and are necessarily to be found in the army horse; on the other hand, none of the coarser breeds used for draft purposes are suitable on account of their locomotion and inability to fill the requirements, their greatest hindrance being in their size, being adapted only for slow purposes, or in moving bodies slowly from place to place.

"Some means must be devised or that particular method found by which the horse, as I understand him to be, that is, one for general utility—one that can fill all offices required of him, whether it be for draft purposes, for driving purposes or for speed, and the happy combination of these three varieties, in my estimation, will generate a breed of horses suitable for the army, and in fact, the most suitable horse that can be developed for such purposes."

* * *

Haphazard Breeding.—"History recites the lamentable fact that the would-be aristocracy of England as well as America, being over-desirous to imitate the land-lords and royalty of their own country and the aristocracy of this country, and being over-zealous in making pretentions to that circle in society to which they cannot well aspire, became too reckless in the production or in the attempt to produce a horse suitable for the chase or a hunter, as he is most generally called, and bred for them in a haphazard manner, and it is to be regretted that the breeding of these half-breed horses is too often neglected or conducted on principles when on second thought the most crude farmer may see his folly. The trouble then, as now, with men in the breeding for desirable horses, simply undertook to breed for a colt because they have a dam that is aged or has been injured accidentally, or is unfitted for any longer active work or service, and nine chances out of ten by such haphazard breeding, there is a progeny that is not fitted for any purpose, bearing the blemishes of the broken-down mother, whether over-aged, or injured or deformed; again, on the other hand, there is another and more serious objection to the manner in the specific class of horses, and that is: Throughout our own country—with which I propose at present to speak most directly, all country places, we know of our own observation, are periodically visited by travelling stallions, many of which are absolutely worthless, and the average farmer paying no regard to the elements that go to make up a good horse, will overlook his rough head, his disproportioned limbs, curbed hocks, ring bones, spavins, or any other deformity, whether natural or acquired, and if there is any truth in the universal rule that "like begets like," certainly the fruits of this haphazard breeding is bound to be reproduced and will show most prominently in the districts that are periodically visited by journeying horse breeders."



The above cut represents Limonera, a California horse owned by J. H. Williams, of Los Angeles, with a record of 2:15¾. This horse represents the best strains of the American trotter. He combines the best blood of both Piedmont and Lulaneer, and is especially adapted to the road, as a driver, or to the saddle. In this respect he is what is known among fashionable horsemen as the dual purpose horse.

* * *

The Thoroughbred.—"Now compare this method which I have roughly sketched, to that of the man who produces the only perfect horse in the world, namely, the thoroughbred. To begin with, the breeder of thoroughbreds does not look to the dam or sire alone, but to each individually and separately. The choice of the mother is of great moment in this, that she should be free from all constitutional ailments or inabilities, such as roaring, imperfect sight or weak lungs. My actual experience, in so far as pertains the production of the horse fit for cavalry purposes, or an army horse as it is termed, for the Pacific Coast States, is one that is a near approach to the English half-breed hunter. Owing to the rough, broken surface of the Pacific Coast States and long distances from one watering place to another throughout Southern California, Arizona, New Mexico, Colorado, etc., and in fact throughout all States west of the Mississippi River—the horse best fitted is the horse generally denominated a mongrel, owing to peculiar crosses on his dam's side and the thoroughbred strain on the part of the sire. In the boundless regions of Arizona and Colorado the horses in their wild state are usually degenerates, and owing to inbreeding, have naturally decreased in size. The dams from this inferior class of wild horse grafted onto a half-breed Norman produce an animal of decidedly queer make-up, a particularly bad feature being, the head is disproportional to the body. Taking the dams of this latter and crossing them onto a thoroughbred sire produces a horse that has endurance, and, in my estimation, is most suitable for all around cavalry horse, having the ability to carry a man of from one hundred and seventy-five to one hundred and eighty pounds with convenience; having stamina and ambition to travel long distances; having a well proportioned barrel capable of carrying a meal fully six hours without rest. This horse will measure from fifteen and one-half to sixteen hands high, weigh from eleven hundred to twelve hundred and fifty pounds, his feet in porportion to the body and short couplings, broad loins and a happy blending of the shoulders between the thoroughbred and the draft horse. If necessary, they can be taken from the saddle and put in harness and are large and strong enough to pull a good load, and will outdo a Norman horse, particularly in rough, broken countries; again, if necessary, they may be harnessed to rigs for medium or quick transportation, and have the sense and docility of the thoroughbred."

"The raising and preparation of the last above described horse should, I think, follow an entirely different line to that of the draft horse or race horse, except in this: that it should be tamed so as to overcome any fear in infancy of his preceptor; at the age of two years handled, at three years he should be ridden, and at four years he should be ready to do service other than the military or army drill that he must necessarily take to properly fit him for cavalry purposes. I believe, furthermore, that horses for cavalry purposes should not be reared in low or swampy grounds, but on the prairies and in the hills or mountainous districts, where by nature the best hoofs are grown. If in the mountainous districts, they are as well or better off than on the prairies, there every muscle and limb and joint is brought into a natural and active service. Scampering over the hills preserves perfect lungs and develops them to their fullest extent.

The greatest care, however, is in laying the foundation for the horse desired to be produced. Great care should be had in the selection of the dam and sire—to note that each are free from any natural blemishes or imperfections—and then the old adage that like produces like" is not only to be hoped for or expected, but is to be and will be realized.

"Marketing the horse is a secondary consideration; produce the article and the market will hunt you."

* * *

The general-purpose driving horse ought to be bred along the lines indicated in the breeding of the army horse. He should have strength without too great weight, reasonable speed without being fast, and so thoroughly tamed as to make him safe under all circumstances.—Editor.

BY J. W. MILLS, POMONA, CAL.

PICKLING OLIVES.

Editor Cultivator: Will you please tell through your paper, how to pickle ripe olives. Where can I get a book which tells how to do it, and which does not cost very much.—Subscriber.

The olives should be graded for size and ripeness, different varieties being kept separate. When ripe and partly ripe olives are mixed during the curing process, part will finish before the others, even though they are of even size.

The olives should be covered with a potash solution of lye, made in the proportion of one pound to seven gallons of water. The pickling vessel should be so arranged that the liquid may be drawn off from the bottom. The reason for this is that the lye settles and becomes more concentrated at the bottom, and should be drawn off and poured over the fruit at least once a day. Lye should not be used longer than three days. After this length of time has elapsed the lye seems to have no effect on the olives. The lye should be boiled and skimmed before using and poured over the fruit hot. This acts as a disinfectant. Should the olives show a tendency to get soft, add about a third of a pound of salt to a gallon of lye. This will have a tendency to harden the olives. The great difficulty in pickling the olive, is to prevent them from spoiling or becoming tainted. Heat is the best disinfectant, as it purifies without leaving any bad effects.

There is no prescribed length of time for leaving the olives in the lye, as even the same varieties will require different lengths of time to cure, depending on the condition of the olive and even the weather at the time of picking. The only certain way to determine when to stop the lye and use fresh water is to cut the olive clear to the pit and observe to what extent the lye has penetrated. The lye should be stopped just before it penetrates to the pit. By the time the water, during the process of rinsing, begins to take effect, the lye has gone clear to the center. By cutting a few olives a day, the time at which to commence washing may be very closely determined.

The water should be changed at least twice a day while extracting the lye, oftener is better. If the vessels can be so arranged, it is best to let the fresh water flow in at the top as fast as that is drawn off at the bottom. It has been our experience that exposure to the air has a tendency to bring about some sort of infection which starts the cured fruit to "go wrong." If a weak boiling brine is poured over the fruit about every other day instead of clear water during the curing process, it will make the fruit keep better. Bear in mind that pickled olives can only spoil by becoming infected with some bacteria or fungus germs. If these are headed off during the curing process, and kept out afterwards, the fruit will keep indefinitely. Hot water is the best disinfectant, but it has a tendency to soften the fruit. This can be conteracted by the use of salt either in the lye or rinsing water.

After the lye has been extracted by the clear water process, the fruit should then be pickled in brine. The stage at which the lye is all extracted may be best determined by the color of the water which goes off in the rinsing process. The water that contains lye will be dark in color and frothy. At the latter part of the washing period, tasting olives of different sizes will determine the point at which the lye is extracted to a nicety.

The first brine should contain about six ounces of salt to the gallon. Allow it to stand two or three days, draw it off and put on a brine containing 14 ounces of salt to the gallon. Allow this to stand till ready to pack the olives for storing, when the brine may be made up to a pound or more of salt per gallon. The light brine is used first to prevent shriveling the fruit, which it will do if put into strong brine when first taken out of the fresh water. Put all of the brines on the fruit while they are boiling hot, and especially the last brine.

The olives must be kept covered with a cloth and shaded during the curing process. Glazed crocks or parafined wooden vessels must be used.

The Agricultural Department of the State University issues pamphlets which treat on such subjects. These will be mailed to you upon application. The columns of this paper will give desired information on any subject in your line that is fresh down to date.

PRUNING THE OLIVE TREE

Editor Cultivator:—What is the proper method of pruning olive trees? My trees are only six years old and have topped them off several times and yet they are twenty feet high. Where can I procure pamphlets on the subject and how am I to procure the same. R. D. W., Exeter.

Your trees seem to be somewhat more vigorous than most olive trees and they will insist on having their own way till they get over their rampant growth. It is fortunate that you have such vigorous trees as it means big crops at some future time. Large trees mean large crops.

Your trees should be pruned so as to give them heavy, stocky branches as only such branches will hold up heavy crops without breaking or being propped. This is done by commencing when the tree is two or three years old and cutting to a small lateral that comes out of a branch that is considerable larger. This prevents the tree from sending out a bushy top if the cuts are made to outside laterals, the tops of the trees will be gradually spread and prevent crowding. The bearing period will come when the trees get over their rank growth. It is impossible to prune the olive so that it will not lose a small branch now and then, no matter how stocky it is trained, but such broken branches do not cut any figuse as they do not destroy the symmetry of the tree. Olive trees fruit as peach trees do and in order to secure moderate annual crops, they must be pruned on the same plan as peach trees.

MANZANILLO OLIVE.

Editor Cultivator:—I would like to know if the Manzanillo olive is a self fertilizer. Mrs. L. A. H.

Manzanillo is a self fertilizer but like all olives, has its "off" years when it will be full of bloom and set very little fruit. It is better to plant two varieties as they have beneficial effect upon each other. We would recommend planting Mission with your Manzanillo. If we were contemplating olives we would plant Mission and Santa Catarina. The latter will make an early pickle of fine quality, though it is not dark in color. There are dark olives which ripen early but they are very apt to be diseased at the pit and do not keep well.

RECLAMATION OF THE IMPERIAL VALLEY.

One of the most striking features in the opening of a farm by irrigation is the rapidity with which the land takes on the appearance of long occupancy once the water is applied. There is little of the long wait that attended the settlement of the timbered lands of the Mississippi valley, few of the early day privations and hardships that marked the opening of a farm in those sections. The delay comes in the constructing of the main canal, and once that is accomplished the farms are made. For the owner to plow and seed every acre in the first year of cultivation is not exceptional. By the second or third year the tree growth has come to destroy the level stretch and bleak appearance and so obliterate the last reminder of the desert.

The story of opening one irrigated section reads much like that of another and while the following account is largely confined to the experience in the Imperial valley in California, it will serve almost as an account of similar enterprise in any of the irrigated sections of this state.

The history of arid America relates many interesting tales of the creation of vast deserts back in ancient geologic times, but none more impressive than the story of the great Colorado desert in extreme southwestern California, the desert which has become famous as the death bed of so many venturesome fortune hunters.

The Colorado desert is distinctive. Of all the deserts of the West it alone lies beneath the level of the sea; it alone was builded by a river.

From the beginning of time the Colorado river, a snow-fed stream rising on the west slope of the Rocky Mountains, has been rushing madly toward the sea, discharging an immense volume of water into the Gulf of California. It does not traverse broad fields and fertile valleys, but throughout its entire course has cut its tortuous way down monutain gorges, until it finally reached the gulf.

The Colorado has been an effective tool in the hand of that great artist, Nature. Through countless ages it has been carving out canyons which for scenic grandeur have no equal in the entire world. But the carving of these canyons has meant the tearing away of millions upon millions of tons of solid rock. The process of erosion is slow, and the rock has been removed in minute particles, but these particles, mingled with the sediment brought down to the river by the melting snows and mountain streams, have given the Colorado its reputation as a muddy river, for it carries more silt than any river in the United States save the Missouri.

Like all silt-bearing streams the Colorado has built a delta at its mouth, a delta more expansive and more unique than that of any other river in the world. It was this delta that eventually created the great Colorado desert.

Back in prehistoric times, instead of heading seventy miles south of the International boundary line, the Gulf of California extended more than 100 miles northward into what is now California. It was walled in on either side by high mountain ranges. The Colorado river entered the gulf from the east, at a point near the present international boundary. There it deposited its silt and solid matter, and soon began the building of a delta. The delta steadily pushed westward and southward until, after years innumerable, it reached across the gulf, to the foot of the range on the west. In seasons of low water the delta formed an effective dam, shutting off the northern extremity of the gulf from the gulf proper, creating what became in fact a small inland sea, 100 miles in length and fifty miles across at its widest point.

Under the scorching rays of the sun the waters of the inland sea rapidly evaporated, until the sea became perfectly dry, leaving an enormous sink at one point 287 feet below the original level of the gulf.

Each summer, with recurring high water in the Colorado, there would be an overflow into this inland sea; river water would rush in, carrying in sediment with it. As the floods receded the water in the sink again dried up, leaving behind a thick deposit of silt on the bed of the former gulf. This process of inundation continued, probably for centuries, the river each year overflowing into the sink, each year adding new soil to what it had deposited the year before. Never, however, was there sufficient overflow to restore the inland sea; only enough to cover the valley slightly, and for a short time, for with each successive dry season the flood waters were carried off by evaporation, or sank into the soil.

The overflow into the Colorado desert, as the old sea bed became known, continued for centuries, until there was a thick deposit of rich silt covering practically the entire sink, the Imperial valley, as it is known today. But as the deposits were made in the Imperial valley they were also made close to the river channel, and today, except in seasons of extreme high water, there is no longer an overflow into the Imperial valley; the river is unable to climb its banks.

Today the Colorado river, that created the Colorado desert, or the Imperial valley, is being utilized in its reclamation. The waters which once freely flowed from the Colorado at certain seasons over into the Imperial country, now have to be diverted onto that vast tract. Fortunately, however, in times of frequent overflow, the waters of the Colorado cut three channels down into the Imperial valley, running toward the Salton sink, and these old channels have recently been connected with the river by artificial canals, and have once more been brought into use as conveyors of water. Five hundred thousands acres of land in the Imperial valley in California, and half as much adjoining land across the international boundary, have been laid off, and are being furnished with water from the Colorado river. Most of this land is below sea level. The reclamation of the entire area has been undertaken by private capital, and is being pushed to a successful conclusion.—Irrigation.

TOOLS

The name Keen Kutter
eliminates *all* uncertainty in tool buying.
As this brand covers a complete line of tools, all you need remember in buying a tool of any kind is the one name Keen Kutter.
Keen Kutter Tools are without reserve or qualification the best tools that money, brains and skill can produce. No matter how much you pay, no matter who you may have thought to be the best maker of a particular kind of tool, you cannot get any tool, anywhere, better than those sold under the name of Keen Kutter.
If your dealer doesn't keep Keen Kutter tools write us and learn where to get them.

KEEN KUTTER

Tools received the Grand Prize at the St. Louis Exposition—the only such award ever given a complete line of tools.

Some kinds of Keen Kutter Tools
Chisels, Knives of all kinds, Hair Clippers, Scissors, Shears, Adzes, Axes, Brush Hooks, Choppers, Corn Knives, Cleavers, Hay Knives, Scythes, Saws, Horse Shears, Tool Cabinets, Etc.

IsHard, Round and Sweet=
Lilly's Glory Cabbage

We perfected this variety on our own experimental grounds, and it has proven a wonderful success, pronounced without a doubt the best cabbage for this coast. It is as hard as the Danish Ball Head, and has an even more perfect roundness. It matures in mid-season, earlier than any other hard, round cabbage. In quality it proves most excellent, tender and crisp. This cabbage is destined to be the most popular variety on the coast. For market purposes it is unexcelled. It is a ready seller and it is so good that a profitable trade can be built up for it. We advise all our customers to try this cabbage. Sold only in sealed packages. Price, pkt, 10c oz., 35c; lb., $3.50.

UNCLE SAM'S GREAT IRRIGATION WORKS.

Millions of acres of arid land in the West will be thrown open to the farmer through irrigation, and the huge projects which the government has on hand under the national reclamation act will, it is claimed by the most enthusiastic irrigation experts, open the way for the mightiest Anglo-Saxon civilization the world has ever known.

Under the reclamation act the government will construct the largest irrigation works in history, far excelling those of Egypt and India. The reclamation act provides that funds from the sale of certain public lands shall be applied by the government to the building of irrigation works. At the present time the fund amounts to about $28,000,000 and is increasing at the rate of $4,000,000 annually. This fund is self-continuing. After the irrigation works have been constructed the sum expended in any one work is to be returned to the government in ten equal annual installments by the settlers pro rata. At the end of the first year, after any one project has been completed, one-tenth of the original amount expended on that work is to be returned and put into other projects.

Among these great works undertaken by the government is the Shoshone project in Wyoming, which will irrigate 160,000 acres of public land; the Uncompahgre valley project in Colorado, 10,000 acres; the Belle Fourche project in South Dakota, 85,000 acres; the Salt river project in Arizona, 200,000 acres; the Malheur project in Oregon, 90,000 acres; the Hondo river project in New Mexico, 10,000; the Fort Buford project in Montana, 60,000 acres; the North Platte project in Wyoming and Nebraska, 300,000 acres; the Minidoka project in Idaho, 130,000 acres; the Yuma project in Arizona and California, 115,000 acres; the Truckee-Carson project in Nevada, 350,000 acres; the Klamath project in Oregon and California, 2,000,000 acres. Beside the projects enumerated, which total no less than 3,600,000 acres, the engineers of the reclamation service are preparing surveys on a great many other projects which will be undertaken as rapidly as the fund expands and is returned to begin work.

Fifty million acres of arid land, it is estimated, at present totally unfit for agriculture, will be opened to the settler through the huge irrigation works which the government will construct under the national reclamation act.—Hamilton Wright in National Magazine.

EUCALYPTUS, MALARIA AND MOSQUITOES.

The eucalyptus will not live in the winter anywhere where the temperature falls more than a few degrees below the freezing point. Malarial fevers are prevalent at times in marshy ground, and mosquitoes breed in marshy places. The eucalyptus, by reason of its rapid growth, absorbs so much water from the soil as to actually drain marshes of superfluous water and destroy the breeding pools of the mosquito. Any rapid growing tree would do the same service, though in a less degree than the eucalyptus, which is a more than commonly rapid grower, but the Carolina poplar would be a good substitute.

Like the hinge on a door—men's principles work but one way.

Citrus

Roses

And Every One True to Name

When you buy goods of any kind you of course find it to your interest to do business with an old established firm that has made a reputation for itself by selling dependable goods. Did you ever stop to think that a nursery that has been engaged in working along certain lines for a period of twenty-one years, and has developed a business extending throughout California, as well as into many other states and foreign countries is a safe institution for you to do business with? Growing trees is no difficult matter, but to have them true to name requires great care and a thorough knowledge of the business brought about by years of hard work and close application to business, backed by a pride to give our customers, old and new, square treatment, and never to make any misrepresentations.

Deciduous Fruit Trees

Are grown in new land in the great Kings River bottom where the soil is so deep and loose that our trees have not only made a magnificent top growth, but have a fine fiberous system of roots, which is in itself a great recommendation to any fruit grower.

Citrus Trees

If you want an assortment of varieties we can supply you with the leading kinds of Oranges, Lemons, Pomelos, Limes, Citrons, all grown in the great thermal belt near Exeter, Tulare County. Trees are well matured and stocky, with rich, dark green foliage, which is typical of the perfect citrus trees.

Grape Vines

On their own roots and grafted on Phylloxera Resistant roots. The largest stock and the most complete assortment on the Pacific Coast. Let us figure with you on your requirements. It will be worth your while.

Apples

All standard sorts, budded and grafted on whole roots. No piece roots used.

Pears

No blight in our stock. If you want the best come to us.

Cherries

We have a complete line of all the standard varieties, but the bulk of our trees consists of Royal Ann, Bing, and Black Tartarian. Any cherry grower knows how they stand in the markets, and further recommendation from us is not necessary. We have a limited number of trees on Mahaleb root.

Plums and Prunes

are again coming to the front. Prunes have paid well this year and their ready sale shows what can be done with a fruit so universally in demand, when the price is right and the quality above criticism.

Apricots Peaches
Nectarines

We have a good supply of the standard sorts, but stocks are becoming depleted fast. If you contemplate planting this season put your order in now. Don't delay! This is good advice to follow.

CALIMYRNA R FRESNO

Figs

One of Our Great Specialties

In the lead stands the CALIMYRNA, the fig above all others for commercial purposes. Ours is the only orchard in the United States producing these figs on commercial scale. When you buy trees from us you get pedigreed stock. Our seal must be on your trees if you want the genuine article.

Almonds

The Hatch varieties sold for from 13c to 15c per pound this year. Better put in your order at once. The best trees always go out first.

Chestnuts Pecans
Pistachio Nuts

We carry these both in grafted trees and on their own roots, in the very best varieties, of course.

Walnuts

Placentia Perfection is the great money winner, selling for 18c per pound this season. We have trees on their own root, as well as a magnificent stock grafted on California Black Walnut roots. Prices for grafted trees lower than ever before. A fine stock of all other varieties in grafted and also grown from selected seeds.

Olives

California Olive Oil and particularly Ripe Olives are forging to the front after years of earnest and persistant effort to introduce them. We have all the standard pickling and oil sorts. The demand is good and leading varieties are going fast.

We are Universal Providers for Orchard and Garden

We do not confine ourselves to Fruit Trees alone, but grow also an immense assortment of Ornamental Trees and Shrubs, Climbing and Trailing Plants, Palms for House Decoration and Outside Planting, Roses in Tree and Bush Form.

Free Catalogue

We will mail our large, profusely illustrated catalogue, English or Spanish, to any address on receipt of 5c postage. Price list mailed on application.

Box 14, Fresno, California

The orange growers of Lordsburg re much interested in the novel manner of packing oranges which is to e adopted by the La Verne Citrus ssociation. The oranges will be laced in separate cardboard compartments, each carton containing welve oranges, a number of cartons re then packed in a crate.

San Dimas Citrus Nurseries

How to Grow Oranges?

Easiest thing in the world—next to getting rich. All there is to do to get rich, you know, is to get lots of money and keep it.

To grow oranges—fine ones that bring big money—you must have Good Trees, Good Soil, Right Climatic Conditions, and a hundred and one other things.

But if the hundred and two or three other things are just right and the trees—the little nursery trees—are stunted or indifferent as to pedigree, failure, or but poor success will result.

Therefore start right

Get a copy of "How to Grow Oranges," which contains a fund of information. To be had for the asking.
Then buy the best trees to be had and save years of exasperation.
The best only are grown at the San Dimas Nurseries. Thrifty, stocky roots. Buds true to name and of strong bearing trees.

CITRUS FRUITS

PREPARING A CITRUS STOCK BED.

Editor Cultivator:—Will you be kind enough to tell me through the columns of your paper how to prepare a citrus seed bed. When is the proper time and where can the seed be procured?
be procured?—Jas. H. W., Bardsdale.

In preparing a citrus seed bed, the earth should be excavated to a depth of two feet and th hole filled in with soil run through a quarter-inch mesh sieve to remove all hard lumps and stones. Running a little well rotted stable manure through with the dirt will hasten the growth of the nursery stock. If the soil contains hard lumps or small stones, the roots of the seedlings will turn around them and make crooked, unsightly taproots. This is not of so much importance as it used to be, when a large number of orange trees were sold with bare roots, but still the straight roots are preferable, as they do not branch out so much at a shallow depth.

The seed should be sown half an inch apart in drills six inches apart and covered an inch deep with clean sand. Shade with burlap or muslin and keep the surface of the bed damp, do not allow it to dry out.

Seed may be obtained from any healthy seedling orange tree or pomelo tree. The fruit should be bruised and packed tight in a box or barrel, and when rotten wash the pulp out and separate the seed. Put the seed in a sieve and pour dry sand over them so that they will not stick to the hands and sow them in the drills as refered to above.

The soil in the seed bed should be thoroughly settled with water and leveled before the seed is planted. The drills should not be deeper than the diameter of the seed. The one inch of sand will cover enough. One half inch of sand is enough, and the seed will come up sooner, but with such shallow covering there is danger of them becoming a little too dry, which is fatal at the time of germination. The seed may be secured and planted any time in May.

Citrus Trees at Cloverdale, Sonoma County.

CULTIVATING CITRUS FRUITS.

If we have such a February as indications now warrant us in expecting little can be done in this line until the bulk of the heavy rains are over. The more you cultivate in a wet season the more the soil runs into a solid mass without any life to it. Better wait until the ground gets warm and the heavier rains are over before doing anything in stirring the soil, and probably March would be plenty early enough to begin. However, much can be determined by the character of the rainfall in February. Bounteous rains in February give promise of rains as late as April or even May, so there is always opportunity to recover from tardy work.

The Chicago Packer speaks from an advised standard when it declares "The California fruit and vegetable growers are squirming more than ever under the burdensome yoke of the marketing trusts, private car line extortion and high freight rates. For years the California producer has sealed his mouth, evidently considering it suicidal to openly oppose the fruit and vegetable distributers commonly known as trusts. Year after year he has labored, but without benefit to himself because of the extortionate cost of marketing. Ground down to the limit of endurance and furious at the treatment accorded him, the grower is openly kicking. If the ball ever starts rolling right in California there will be something doing all along the line and some strange faces may be found among those handling Pacific coast oranges as well as vegetables.'

ORNAMENTAL PLANTING.

Too many farmers would rather have their path from the kitchen or front door of the house and the barn between two rows of corn than to see a nice bluegrass lawn, nice shaded trees, shrubs, roses and other beautiful flowers, nicely arranged about the house. They think it is for the good of the families that they utilize every foot of ground possible for the production of corn and other grain, but surely they are therein mistaken. It is no wonder that the young folks on such farms get tired of the rural monotony and are off to the city. The onamentation of country homes is nearly if not quite as important as the production of the best fruits and vegetables. What is there that could be more fascinating to children than an abundance of good fruit and beautiful flowers? It teaches them to observe nature, and when they once learn to understand more about the beautiful work of nature they cannot be driven from their beautiful home in the country. Never mind about the location, for it matters not where you live or what may be the lay of your grounds, you can make it beautiful and interesting by planting the right kinds of fruits, vegetables and flowers in the right way and attending to them properly. Now, don't say or think that it is too much work, for without missing the time you can make a wonderful improvement if you only set your head to it.

It is really a pity to see how the young men are swarming to the cities for employment when they could do so much better by staying on the farm, if they only knew it. When I say that the average farm boy leaves home because it is too monotonous I think I can prove the correctness thereof with the statement that there is not one young man leaves a fruit farm with beautiful surroundings to where there are ten leave the average grain farm where fruits and ornamentation are overlooked. I know there are more grain farms than fruit farms, but when I make the above statement I am speaking comparatively. Is it, then, not worth our while to give a little more attention to those important things? That persistent struggle for the almighty dollar is supposed to be for the good of your family, but I am sure you will succeed much better in the contentment and health of your family by changing your plans in the manner indicated above.—E. H. Riehlin, F. & F. World.

WIDE AWAKE VILLAGES.

It has remained for the town and village improvement associations to teach us what it means to have yards that are attractive from curbstone to alley. They have educated children to have a proper regard not only for the premises on which they live, but for their share in beautifying the public school grounds teaching them that when they deface its walls, break windows, pull up its flowers and destroy its trees they are despoiling their own property, a very foolish thing to do, to say the least..

GARDEN BEAUTY.

The chief beauty of the garden should lie in its flower-colors and plant forms, and not in the symmetry of its beds and borders. If our ideas of a perfect garden include any rigid geometrical principles, we would better study nature and let our ideals go! Our ideals, at best, are extremely limited, while nature's realism is immeasurable; she puts so much variety into her reality that she is more beautiful than we can imagine, by sheer force of quantity! . . . We should seek to display the whiteness and purity of the lily in the garden, and not trouble ourselves so much about the brown earth patch from which it grows.—F. S. Matthews.

RETAIN NATIVE TREES AND SHRUBS.

In making plans for the house surroundings, do not forget to consider the views over the farm. Every practical man well knows that thickets of shrubs and many fine trees cannot be retained to a great extent in farm fields without making these fields less valuable for farming purposes. There are usually places, however, on every farm, in swampy places, along stream sides, or steep or barren slopjes on ledges, in narrow strips of land along the roadside, at the junction of fields, that can never be made of much value for farming purposes. Almost every reasonable man will see that it is more desirable to retain the trees and shrubs on such land, for it adds to the beauty of the landscape without detracting from the value of the farm. If is often a measure of economy, too, to have the steep slopes covered with a thick native growth in order to prevent them from gullying and to prevent the expenditure of useless labor in keeping them in order. A thicket of trees and shrubs, if let alone, will take care of itself and require no especial attention. If it be sufficiently extensive, it will also be practicable to secure from the growth upon it pieces of timber that are required for the repair of various farming implements, or for firewood, without destroying the few fine trees or the groups of fine trees, that would be reserved as interesting objects in the landscape. Other men, having appreciation of the beauty of fine trees, will be willing to sacrifice a small piece of tillable ground for the sake of preserving now anad then a specimen to add to the general beauty of the landscape.

LOCATING SHRUBS FOR EFFECT.

Many, and indeed most, of those who enter with enthusiasm on the improvement of their home grounds devote both time and money to the securing of trees for this purpose, and frequently too many of them; and then, deeming their task complete, "retire upon their laurels." When, however, the trees begin to shoot upward, and, shedding their lower branches, open up the grounds again to the searching winds, it is seen that without the co-operation of their more humble allies, the shrubs and dwarf trees, their mission is but poorly accomplished. Much more effective, even as a shelter-belt, will a group of trees become if its borders be extended somewhat by shrubs from the neighboring hills and canyons.

A RARE COLEUS.

Coleus thyrsoides is a new departure among coleus by being a desirable-flowering plant. It more resembles a salvia than a coleus, producing long spikes of quite showy blue flowers.

LILLY'S BEST

ROSES.

Invite the Rambler Family
and Have Them Bring the Baby

The Ramblers are the aristocrats of all Roses. The Baby Rambler (Mme. Levavaseur) is a dwarf crimson beauty which blooms with all the luxuriance of a climber. The Baby is ever-blooming and while it attains a stature of only twenty-four inches it contains as many roses as you would expect to find on a bush five times its size. The Baby is the pet and the pick of the Rambler family.

The demand for the Baby is large and we fear that our supply may not hold out. You and your friends had better place your orders early. Home is not a home without a "Baby."

Prices, one Baby Rambler root 75c; Six, $3.50; Per Dozen, $5.00

Our rose roots are Northern, out of door grown. They are hardy roses and are packed for shipment with extreme care. They will arrive in perfect condition ready for immediate planting.

Crimson Rambler—Grandest climbing rose ever grown, presenting its crimson blooms in pyramidal clusters which contrast beautifully with the bright green foliage and keep their color for weeks. Very hardy and will grow most anywhere. Each.........35c

Our 1905 Catalog is the Largest, Best Printed, and Most Comprehensive Seed and Plant Catlog issued on the Pacific Coast. You want it if you love Nature.

Philadelphia Rambler—Similar to Crimson Rambler but deeper in color and more double. Each............35c

Pink Rambler—Like the other Rambler in habit of growth, producing in cluster of from ten to thirty blooms of a shell pink, fading to almost white. Each......35c

Dorothy Perkins—The best Pink Rambler. As hardy as Crimson Rambler and of the same habits. Blooms more double and curled, and holding their color a long time without fading. Each.............35c

White Rambler—Almost identical with Crimson Rambler except the blooms are pure white and very sweet scented. Each.................................35c

This is a healthy family baby and all. They do not mildew or become easily a prey to insect growth. They are all sure bloomers.

This family of Ramblers (including the baby) sent to any address for $1.50 charges to be paid by purchaser.

In the Vegetable Garden

ORIGIN OF VEGETABLES.

Cucumbers are from middle and southern Asia and have been cultivated from a very early date. Asiatics claim they are "good for stomach troubles" and no doubt they are correct; they certainly are not good for one who has such troubles.

The nativity of the musk melon seems uncertain. It probably came from Persia. It has been cultivated in England since 1570, having been introduced from Jamaica.

The pumpkin was introduced in the same year, from the Mediterranean region, though its original home has not been satisfactorily determined.

The tomato (German, love-apple) was sent to England from South America, its native country, in 1596, and from there introduced to the West Indies and the United States.

The watermelon has been in cultivation so long that authentic history on its nativity is lacking. It seems probable that it is native to the warmer regions of the Old World.

SOIL FOR PLANTING.

The soil should be moist when the seed is put in it. Many persons prefer that the planting should be done just before a rain; but in this practice care must be taken against the baking of the soil over the seed. It is usual to firm the earth above the seed by patting it lightly with a hoe or walking over it, placing one foot close to the other. This is to make sure that the soil is brought close against the seed.

Small, weak seeds must not be put in the ground that bakes, or is not thoroughly prepared. It is well to sow some large seed of vigorous growth, such as radish or turnip, with celery and other small weak seeds. The added seed comes up, breaking the crust, so as to let out the weaker plants. Also they show where the row is, and this makes way for cultivation before the crop is up. Of course the radishes or turnips must be pulled up as soon as the other plants appear. Celery and other seeds that germinate slowly should be shaded.

Most seeds must be sown much more thickly than the plants can be profitably grown. If they come up, well thinning is necessary, and this should be done, as a rule, as soon as the first true leaves appear. In thinning care must be observed not to loosen the roots of plants that are left.

CABBAGE.

The best soil is a deep, rich loam, well worked. Positions shaded during part of the day are to be avoided, for cabbages require abundant light and warmth. A liberal amount of stable manure or other fertilizer will make good returns.

The young plants should be started early and transplanted in hills three feet apart. It is best to wait for a rain before setting out, but shallow drills may be made and soaked with water over night. A light mulch should be applied to the plants when set. In dry, hot weather water should be given liberally and freshly set plants shaded if possible.

HOTBEDS.

In the colder regions of California the farmer can build and use a cheap hotbed with great satisfaction. The labor and material needed are small. A January hotbed will supply green things during February and March. Every farmer's table will appreciate these good things in late winter. The fresh lettuce, radishes, beets, carrots, spinach, etc., to be grown are a boon to any farm family.

It is so simple and easy to have these things. First select a sheltered spot behind a barn or tight fence or a southern slope. Dig a hole one and one-half feet deep, four or five feet wide, and as long as wanted. Put stable manure in this to a depth of six to twelve inches and then cover with ten or twelve inches of good loamy soil. Now build a cheap frame of wood over this bed. Make it two feet above ground, level on the north (back) side and six inches above that level on the south. Throw loose earth up against this frame to keep out cold air.

Use either cheap canvas for covering beds or window sash. If only canvas is used very cold snaps may require the use of gunny sacks or other heavy cover for one or two nights. It is often more economical to do this than to buy sash. Sash gives more perfect protection, however. Canvas covers are tacked to rollers on lower edge for easy handling.

The frame must be kept carefully covered on cold days and nights, and opened to the sun on warm days. The bottom heat supplied by the manure at the roots of plants will force the crops wonderfully. Rain is very beneficial to such beds if not too copious. If the soil is kept very dry the plants burn. If kept too wet plants "damp off." A little ashes and sulphur sprinkled on top of the soil just after planting helps to keep out insects and make plants healthy.

Any family can use a hotbed five feet wide and ten feet long to advantage at this season. This is the place for growing relishes in winter, and starting plants in early spring when too cold for out-door planting. The truth is that such a bed in use in the colder or mountainous parts of California will put them way ahead of the season. In Southern and Central California the hotbed is rarely needed in winter. A cold frame in these regions is usually sufficient. In making a cold frame, follow suggestions above given, except we must omit the manure. No bottom heat is needed in this case.

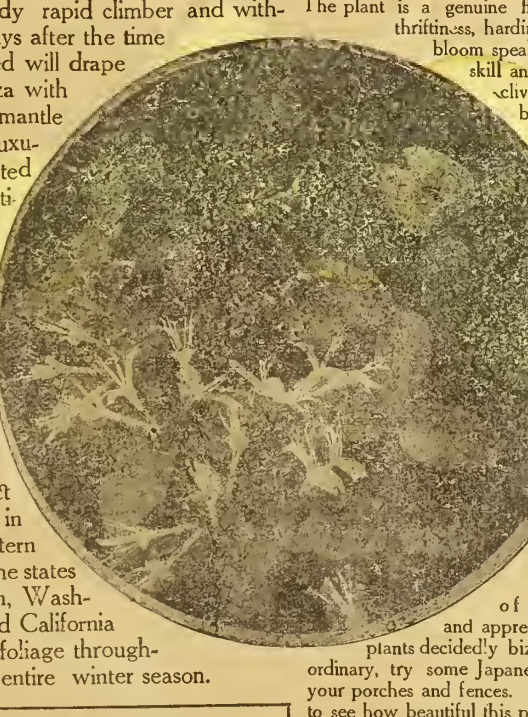
JAPANESE HONEYSUCKLE
This Floral Wonder is the Latest Importation from the Land of the Mikado
Is a sturdy rapid climber and within sixty days after the time it is planted will drape your piazza with a brilliant mantle of green luxuriantly spotted with beautiful white flowers turning to yellow. It blooms constantly—is never bothered with insect pests and in the Western parts of the states of Oregon, Washington and California holds its foliage throughout the entire winter season.



The plant is a genuine floral wonder. Its thriftiness, hardiness and prodigal bloom speaks volumes for the skill and plant-loving proclivities of the little brown people of the Occident who 've nurtured and improved this climber for so many years. We have imported a large number of these parent vines from Japan. They take root on this coast as readily as they do in the native clime. If you are fond of beautiful climbers and appreciate something in plants decidedly bizarre and out of the ordinary, try some Japanese Honeysuckle on your porches and fences. You'll be charmed to see how beautiful this plant will make an ugly old fence or shed apppear.
IVY COLLECTION—No garden is complete without Ivy. We have a fine stock of healthy roots. The old favorites Boston Ivy—English Ivy—Kenilworth Ivy—and Variegated Ivy are 25c. per poot or the set of four for 50c.
CLIMBER COLLECTION—We will send you this whole collection of seven climber roots postpaid for $1.00 Japanese Honeysuckle—Kenilworth Ivy—English Ivy—Trumpet Creeper—Japanese Hop—Virginia Creeper—Boston Ivy.
Our shipments are all packed with extreme care. All roots are imbedded in moss and will travel ten miles or ten thousand miles with absolute safety. They will arrive in perfect condition; are ready for immediate planting.

C. H. SESSIONS, ASSOCIATE EDITOR

TO KEEP MOULD OUT OF CREAMERIES.

Mold in the creameries is one of the serious difficulties which the creamery man has to contend with, says a writer in the Farmers' Sentinel. When it gets thoroughly established it is extremely hard to get rid of, as it is a fungus growth which produces seeds or spores and multiplies to work into every nook and corner, from which nothing but severe measures will serve to dislodge it.

One little patch of mold in a damp corner, if left to itself, will, under favorable conditions, in time infest all parts of the building, unless it be dry and light. It will spread to the butter tubs and the spores will lodge there, and, even though they are not in evidence when the butter is shipped, they will develop, penetrate the wood, and form moldy spots on the butter. During the last few years losses in moldy butter have been sustained to the amount of many thousands of dollars.

Investigations have been made by the dairy experts of this country, Canada and Europe to ascertain the best means of preventing the mold from getting a foothold and to find a simple method of preventing its growth and of eradicating it. They have found that it takes as naturally to certain conditions as a duck takes to water. It develops the most rapidly where the temperature is but slightly above the freezing point and where there is but little circulation of air. One bad feature of mold is that it gets well established before it is much in evidence. Often the first intimation of mold that the unwary buttermaker receives is when he gets word from his commission man that his butter was moldy, or the receiver of his butter advises him to soak his tubs and liners in a strong brine in which he should put two or three ounces of formaline to the gallon of water.

To keep mold from the creamery the refrigerator should receive at least two good lime washings a year. On shipping days while the refrigerator is empty the doors should be thrown open to let in the light and afford a free circulation of air.

A little mold on butter tubs often lowers the grade of butter as much as 2 or 3 cents a pound and leads to much waste, as it frequently becomes necessary to scrape off and throw away considerable of the butter on the outside of the package.

Mold leads to the premature destruction of a creamery or any other wooden building in which it gets a foothold. It breaks down the substance of the wood and it becomes rotten and useless. Creameries do not stand half as long when infested with mold as they otherwise would. Barns or other outbuildings with leaky roofs and without proper ventilation or light soon become infested with mold which leads them to premature decay.

Laugh and forget it.

BUTTER PACKAGE MARKING LAW

Editor Cultivator:—Will you kindly publish the law passed by the last legislature relative to marking butter packages? There seems to be some misunderstanding as to its provisions.—A. E. B., San Luis Obispo.

The following is the full text of the act approved March 20, 1905, as passed by the legislature.—Ed.

Section 1. No person or persons, firms or corporations by themselves or their agents or employes, shall sell, manufacture or prepare for sale, offer for sale or expose for sale, or consign, ship or present to any dealer, commission merchant, consumer or other person any butter in packages containing less than six pounds and more than one-half pound, unless the exact weight of such butter contained in such package or packages, rolls, prints or other form of package, expressed in the number of pounds or ounces or in both pounds and ounces, shall be printed or durably and legibly marked upon the wrapper or other container of such butter in letters or figures, or in both letters and figures, not less than one-fourth inch high and upon the side or face of such package upon which the producer's or seller's name and address appears, and if such name and address does not appear, the weight alone shall be legibly and durably placed upon such package in letters or figures not less than one-fourth of an inch high.

Sec. 2. Whoever shall violate any of the provisions or sections of this act shall be deemed guilty of a misdemeanor and upon conviction thereof shall be punished by a fine of not less than $20 nor more than $100, or by imprisonment in the county jail for not less than ten days nor more than fifty days, or by both such fine and imprisonment at the discretion of the court.

Sec. 3. It shall be the duty of the State Dairy Bureau, now existing under the laws of this State, to enforce the provisions of this act and to cause the prosecution of any person known to be guilty, or that it has reasons to believe to be guilty, of violating any of the provisions of this act. It shall be the duty of the district attorney of each and every county in this State, upon application from the State Dairy Bureau, to attend to the prosecution in the name of the people of any action brought for the violation of any of the provisions of this act within his district. One half of all fines collected for the violation of any of the provisions of this act shall be paid to the county in which the fines were imposed. The other one half shall be paid to the State Dairy Bureau and by said Bureau to the State Treasurer, and the same shall become a part of the appropriation made by law for the use of the State Dairy Bureau.

Sec. 4. All acts and parts of acts inconsistent with this act are hereby repealed.

Sec. 5. This act shall take effect sixty days after its passage.

TUBULAR--or "Back Breaker?"
When you see the waist low Tubular you can't be driven into buying a back-breaking, "bucket bowl" separator. **Can and crank are just the right height on the Tubular.** Here is the largest Dairy Tubular along side four "back breakers." The girl with her hand on the Tubular is 5 feet, 4 inches tall. This is an exact reproduction from a photograph. **Which kind for you?** Makers of "back breakers" try to get their cans low by setting the cranks low. **High cans** break your back backward—**low cranks** break it forward. Unless you are a double jointed giant, you'll find a high can is no joke. To show you how high these "back breaker" cans really are, when the machines are set high enough to turn easily, we raised these "back breakers" 'til their crank axles were level with the Tubular crank axle. "Back breaker" makers don't like this picture—**it's too true.** They try to squirm out of it. **You wouldn't like turning cranks as low as "back breaker" makers put them.**
The low can is only one of many advantages Dairy Tubulars have over all others. Dairy Tubular bowls are simple—"back breakers" are complicated. Tubulars are self-oiling—no oil holes to fill up. "Back breakers" are oil drippers and oil wasters. To learn a lot more about Tubulars, write today for catalog N-260

¼ TO ½ BUTTER LOST THIS WAY

NO BUTTER LOST THIS WAY

WHICH?
Which way do you skim your milk?
It is hard sometimes to realize just how great the loss of cream is with crocks and pans. Some people may not believe that a
U. S.
CREAM SEPARATOR
skims enough closer than the old way to increase their butter yield one-fourth or more. But it does. Users say so. Here's an every-day example—
"Carsonville, Mich., July 23, 1905.
"We purchased one of your No. 6 U. S. Cream Separators in 1902. It is all right. It has given the best of satisfaction with no repairs. It is as good as when we got it. We have ten cows and make about **one-fourth more butter** than the old way. It saves me a lot of work—washing pans and carrying milk down cellar, and gives warm, sweet milk for calves and pigs. We would not be without one for three times the price we paid for it, and consider the U. S. the best on the market.—Mrs. MAGGIE KIDD."

MAKING THE BEST OF BUTTER

That is what we all want to do. I am sure there are very few who are satisfied with their present attainments in this direction. Here and there may be found some one who will tell you, with apparent sincerity, that they believe they are making the best butter possible to be made. This must be a decidedly comfortable feeling to have; but as Mr. Moody once told a man who made the public declaration once that he never committed any sin, "I would like to talk with your wife about that!" The sure test of good butter is in the eating; and it is quite possible that if some of the so-called best butter could be submitted to a tribunal of competent judges, much of it might be found to be, like the now notorious Rockefeller contribution to the cause of foreign missions, more or less "tainted."

But setting aside the self-satisfied few, it may be stated as a general proposition that we all want to make better butter than we do. We want to do this for several reasons. In the first place, we have a pride in our business. We want to out-do everybody, ourselves included. The value of bringing away from the county fair a bright new blue ribbon, lies not so much in the premium which goes along with the ribbon as it does in the fact that we have been found worthy to hold the ribbon.

And then there is the value in the money which comes from our labor which is well worth striving for. There is nothing wrong in thinking about the dollars and cents which our butter will bring when we come to place it on the market. Money has its place, and it is necessary to the well being of us all.

The question is then, "How can I make better butter this year than I ever made before?" To answer this in a concise way is the purpose of this article.

To begin with, every farm butter maker should study her own methods. Are they the best possible? If I fail, where is the point of my failure? Satisfied on this point the rest naturally follows. Pride and conceit should at the very outset be banished and we come honestly and humbly to the place where we are ready to learn from any one who can teach us.

Then we must consider our farm conditions. Have we the best and purest water that we can get? If not, that must be done. Without pure water the highest results cannot be attained. Have we a good place to set the milk? If not, surely this must be attended to. We must have a room, away from everything that would in any way affect the sweetness of the cream, and where the temperature is right to bring the cream to the surface as quickly as possible. If we have a separator, a most desirable apparatus in every well ordered dairy, the matter is easier. The cream then is all we need to care particularly about; and this must be stored for ripening where it will be free from any offensive odor, must be watched carefully, stirred to keep it uniform in the process of ripening and finally churned at the right time.

Another essential to the making of superior butter is neatness at every stage of the operation. From stable to package there can be no letting down of the standard here. So many times we hear it said "I'm sick and tired of reading about cleanlines in the dairy!" It has been written about and spoken about more, perhaps than any other one thing in the dairy; and yet, how many of us can truthfully say that we do our level best in this direction? And there are thousands of dairy kitchens in this country into which the mistress would be really ashamed to invite the visitor. Do we not all know this? Then, why sould we be so sensitive on the subject of neatness? It is a prime essential to success. Then let us ask ourselves if there is absolutely nothing for us to learn in this regard. Let us be patient about it.

Again, leaving the domain of the kitchen, is there nothing more we can do at the barn to insure better results? Are our stables as clean as they should be? Are the cows themselves the very best we can procure? There is a great difference in cows. One cow will make butter which will "stand up" under any and all circumstances, hard, firm, sweet, with long keeping qualities. While another cow, with just the same feed, will make butter which is soft in texture, under color, and quickly losing the delicious flavor so necessary to the best butter. Every inferior cow should be weeded out and replaced by one who can be trusted to do her part toward bringing success. To do this intelligently requires a close testing of each cow. Nothing else will do.

And then, are we feeding to the best possible end? Here is a wide field for study. But it is one in which the returns are almost beyond estimate. How to place before our cows the food which will make the best and purest milk and the most of it is a problem worthy of the attention of every farmer in this country. Good hay, free from weeds, supplemented by well-balanced rations of grain, especially in winter; clean pastures in which the grasses are unmixed with foul, stuff, pure water, freedom from annoyance of any kind which will disturb the animal comfort of our herds, regularity in the time of milking, gentle and sympathetic handling while this work is in progress—these are some of the things which the dairy farmer may do to supplement the efforts of his wife to carry off the palm for the best butter made.

Rapidly passing the essentials of extreme care in churning, uniform methods of salting and a system of packing as nearly perfect as possible, we come to the matter of marketing. A man or woman might make butter fit for angels' food, and still never get more than the common price for it. The greater part of the butter made in our country today sells at the price fixed by the poorest article placed on the market. The best butter should fix the price. For this reason every man must make it his business to find a market worthy of his product. He must not be content with the figures which are offered for the common lot of butter. For a time he may find it uphill work to establish a market for himself. It is always uphill business to compete with a thing that is worth nothing. But if he stands firmly by his principle, that good butter is worth more than poor, he will win in the end. Men will find that he is telling the truth when he says he has better butter than those who are willing to take whatever they can get, and then he will begin to reap the reward of his effort.

EDWARD L. VINCENT.

CARING FOR CALVES.

The method for caring for calves at the Minnesota Experimental Station dairy barn is told by P. D. Southworth in the Northwestern Agriculturist.

After the calf has run with the mother two or three days and has been put in good order by her colostrum milk he should be taken away and shut up in a small pen, a partition off from the large calf pen, so that he can not suck the other calves' ears, which is an objectionable practice to allow in a bunch of calves.

Now, right at this stage comes a critical time for the calf. White scours only too often attack him at this period and often, too, he is laid low by calf cholera. Now is the time to give a preventive. Take about a pint bottle of milk at the temperature of 98 degrees F., no cooler, and put in it a teaspoonful of any of the good cresote disinfectant compounds for sale in the market. This, of course, is a germicide and will kill the germs of the cholera in the stomach of the calf. I know this to be a good remedy, and if given in time will often save a calf's life.

The next thing a calf must learn to do is to drink out of a pail. This often takes time and patience. Be free with both, as a little dairy calf three days' old is pretty tender and must be handled carefully. First of all you must have that whole milk at the temperature of the mother's body, about 98 degrees F. The cause of most of the scours in calves is feeding cool milk. Dip the finger in the milk and then let the calf suck it off once or twice, meanwhile drawing his head in this way closer and closer to the pail, until his little muzzle is right in the milk. After he once gets his mouth into it he will soon learn to drink. He should be fed on whole milk for about a month, and then for two or three weeks on half and half, and can then be fed on skimmilk.

At the station we find it a good practice to put blood meal and bone meal in the skimmilk. Others use flaxseed meal with good success.

After the calf is a month old perhaps he will eat a little hay, and then you can turn him out in the big pen with the rest of the calves. Now, as these young animals are susceptible to parasites and diseases, and, as such pests thrive well in moist, dirty places, we therefore see that it is important that we keep the calves and pen clean by liberal use of fork and brush and occasional application of a disinfectant. Above all things the drinking pails must be kept scrupulously clean. It takes a little time, of course, but it pays, because it kills disease. Don't be afraid to use plenty of bedding to keep the little calves off from the damp floor.

The cheapest and the best method in every way for feeding the calves is with the stanchion. They are easily and cheaply made, and in the end will save you much time and money. Each calf then has his place and manger to eat out of, and in that way each gets his share of feed. There is no pushing and knocking over of milk pails and each is allowed to feed quietly by himself.

It is too often the case that the calves are simply fed, then left alone the rest of the time to shift for themselves, and then dairymen wonder why they get sick and are subject to scours. They must receive individual attention in order to give the best results, and they must be carefully watched. "Eternal viligance is the price of success."

BROODER CHICKS.

(Continued.)

Well bred chicks are naturally hardy. Feeding with some end in view, breeding along the same lines there should be steady headway made from year to year. Chicks born of strong, healthy parents come into this world about as well fitted for the stern battle of life as any young animal. Given half an opportunity, fed within the bounds of common sense, and properly brooded, it seems practically impossible to kill them. Fed improperly, crowded in brooder, or having weak parents on one or both sides, and the reverse seems to be the result; they are as delicate, puny and unsatisfactory little objects as can be found.

There are a number of methods of feeding young chicks, any one of which in the hands of an expert, will give good results, but the one that gives the most universal satisfaction under nearly all conditions is the dry feed method. Good, dry "chick feed." This can be purchased ready mixed at the poultry supply stores. It is composed of about a dozen different grains and grit, with a little charcoal, dried blood or beef scraps. I sometimes make my own chick feed by mixing cracked wheat, steel cut oats, Kaffir corn, millet, rice, pearl barley, rape or mustard seeds, beef scraps, granulated bone. I put more wheat and oats into this mixture, using them as the foundation. The chick feed that I buy has in addition some other seeds, such as canary, hemp, rape, etc. I buy chick feed to save myself the trouble of mixing, but there is an advantage in mixing one's own—one knows what one is feeding. Chick feed scattered in the litter, so that the chicks will have to exercise for it, and rolled breakfast oats is the main feed until they are six or eight weeks of age.

The use of a hard grain diet like "chick feed," develops the digestive organs and keeps them in good condition. Where soft and easily digested food is used, the gizzard has not sufficient exercise, the inner membrane becomes soft and flabby, and the digestion is impaired.

When hard, dry grain is used, which is nature's method, the digestive juices are called into full play, the muscles of the gizzard are given plenty of exercise and the result is vigorous and sturdy chicks. The "chick feed" prepared by reliable firms is undoubtedly the best food for young chicks. It gives them all they require except the green food to build up a strong and healthy frame. In the chick feeds wheat, oats and corn are the staples. The other ingredients are what might be termed the side dishes. They are all good and add either variety or spice, and "variety is the spice of life."

* * *

Chicks enjoy a variety as much as we human beings do, and they need it as much. In a wild state of nature the seeds of weeds and wild flowers would give them a great variety, but no wild chicks would even get a mash. Any one who has ever fed "chick feed" and seen the good results of this, the easiest of all ways of feeding, will be reluctant to return to a mash.

Johnny cake as a variety once a day is good when properly baked.

Chicks at first require food every two and a half or three hours, or about five times during the day. After they are three or four days old they should have two feeds a day, of some bright, fresh green food like lettuce, cabbage or the fresh green shoots of sprouted grain, and where it is pospible to give them a clean grass run, it will benefit them greatly.

I feed them five times a day at first, and I always leave a little feed trough or hopper full of chick feed where they can get it. I know this is contrary to the advice of many, but I found the weaker ones did not get the proper amount of food when all rushed for it and it was a comfort to me to know that they had food before them if I happened to be detained at the usual feeding time. Also the chicks were not apt to overload their little stomachs if they had dry food always ready.

The first meal should be at 6 or at sunrise. This should be "chick feed," and should be scattered in the litter, in their outside room or exercising room. I have found it very convenient to scatter this feed at night, and to wash out and fill the water fountain at the same time so as to have it ready for them as early as they want it. They come out at daybreak, eat a little and sometimes drink, and then go back under the hover for another nap. At 9 o'clock, when I scald the drink fountains, filling the milk fountain, I give green food. If a lettuce or two is given them or hung up by a string, they will keep busy and amused for a long time. A sod of grass, a box with mustard or rape or lettuce growing in it, a bunch of tender greens, dandelion, alfalfa or clover. If these cannot be procured, chop up finely some beets, turnips, or even potatoes, for they must have green food. Three hours later, or about noon, "chick feed" is again in order, scattered as before, in the litter. One word about the litter; the best I have found for little chicks is alfalfa hay cut in a clover cutter a quarter of an inch in length. Two hours later some more green food and a full hour before sunset, a last good feed of chick food. I like to send them to bed with good full crops, so the last meal is supplemented with something extra, Johnny cake or egg and bread crumbs.

I can get stale bakers' bread at a cent a pound. I slice the bread, dry it, then either roll it or grind it in the grist mill, and have always a supply of dry bread crumbs. About three times a week I give the chicks a supper of these dry bread crumbs mixed with hard boiled eggs and onion chopped very fine. Three pints of dry bread crumbs, one onion and from two to four eggs chopped well, and all very fine for one hundred chicks. This is in addition to the "chick feed." The onion is a good tonic, the chicks relish it and it prevents them taking cold. On alternate evenings they have Johnny cake. They prefer the egg and bread crumbs. I usually scatter a little good sharp chick grit in this just as I would sprinkle salt on our own food. Oyster shell does not agree with little chicks, it is good for laying hens, supplying the tissue for egg shells, but the little chicks do not require it and it is harmful to them.

Fed in the manner I have described the chicks will be plump and vigorous. At five weeks of age those that are to be sold as broilers should be separated as the treatment from now on will be different for broilers. For those to be kept as breeders the treatment is continued, gradually adding wheat, whole, and keeping a hopper of bran, cornmeal and beefsteak always before them.

To sum up in a few words the rules for successful brooding are—comfort, exercise, proper food. Comfort means warmth and cleanliness, sunshine and shade. Exercise—scratching and running out on range. Proper food—grit, green stuff, grain, animal food and clean water.

WHY ARE EGGS HIGH?

We all know—because hens are not laying now. But why do poultry owners overlook this chance to make money? It must be because they don't believe our statement that

SECURITY POULTRY FOOD
WILL MAKE HENS LAY.

You don't have to take our word. You can be the judge. We can make your hens lay in from 2 to 4 weeks and

WE GUARANTEE IT.

Our dealer in your town will back up this guarantee. Ask him. Will you pass this chance to make money when we take the risk? It also puts sick poultry in healthy condition and keeps them so.

NOTHING ELSE

The best utility fowl grown. The one that is being adopted by practical poultrymen who are in the business for the dollars produced. At the San Diego Show, just held, we won 13 out of a possible 15 premiums, 3 silver cups, etc. See our exhibit at the Los Angeles Show, Jan. 9-13. Eggs from standard-bred Rocks, $1.50 per 12.

WM. M. HUMPHRIES, 241 N. UNION AVE., LOS ANGELES

TO WHOM IT MAY CONCERN:

As the chicken raising season is at hand, we beg leave to call your attention to a few of our specialties: Do you need an Incubator? Our machines are fully guaranteed and have proven themselves unsurpassed wherever used. Do you need Brooders? We manufacture just what you want; fully guaranteed, made of the finest material and of the best possible workmanship, and, above all, a practical machine which saves the purchaser money, time and labor. Do you need Poultry Supplies of any kind? We manufacture a line of Supplies the use of which makes Poultry Raising not only profitable, but a pleasure. Among our specialties are: Our Water Fountains, our Self Feeder for Chicks; our Feed Troughs, large and small; our Lamp Fillers; our convenient Must Hatch Nest Boxes; our safe and sure Must Hatch Insecticide, our sanitary Must Hatch Disinfectant; our sure death Must Hatch Lice Exterminator; our Poultry Compound, a fine Spring and Fall Tonic.

In connection with the above list, all of our own manufacture, we can also furnish the following, which are indispensible to the Poultrymen: The No. 128 Clover Cutter, the Enterprise Bone Mill, the Ohio Feed Cutter, the Banner Root Cutter, the Enterprise Feed Chopper, the Ideal Duplex Feed Mill, and the Farmer's Boiler. Do you wish to make your own Incubator or Brooder? We can furnish you all the necessary parts for making an Incubator or Brooder, also plans for the best and most practical Poultry Houses. Did you ever purchase Just Hatched Chicks? We have a Hatchery of 50,000 chicks per month capacity, in operation the year round and have, for the past few years, been successfully shipping, in our specially constructed carriers, just hatched Chicks, to distances as great as 2,000 miles. If you need them book your order early, as our future delivery list is rapidly filling up. We can also supply White Leghorn hatching eggs in quantities desired. If you have not already received our catalogue, write for Catalogue B, and you will find therein a more detailed description with prices, etc., of the above.

Hoping to hear from you in the near future, we are, yours very respectfully,

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

and charcoal all the time. I saw two die, and they seemed to have a convulsion. First I thought they were poisoned, but upon examining them found that not to be the case. Now could you enlighten me as to the cause and what to do?

Answer.—The symptoms, so far as you have given them, are thouse of apoplexy or of poison. The cause of apoplexy, which is the result of a rupture of a blood vessel in the brain, are due to stimulating food, to an overfat condition of the bird, to mechanical injuries, to violent exertion or excitement, and to straining in laying eggs, hens being sometimes found dead on the nest. There are no premonitory symptoms in the disease. The bird is attacked suddenly, falls nearly or quite insensible or dies on the spot.

In most cases treatment is impossible, as the bird dies before it can be administered. But as a number of cases have occurred in your flock it will be well to take some preventive measures. Balance the ration differently. Reduce the amount of fattening grain, such as corn, give the grain in the scratching litter so the hens will have to work and eat slowly. Give a tablespoon of Epsom salts in two quarts of water for a week. Increase the amount of green feed, and, if possible, give the hens free range.

I cannot help thinking that either you or your neighbors have poison out and that it has been carried to your hens by rats, gophers, squirrels, or mice. Unless you are a student of medicine you would find it difficult to detect the small amount of poison necessary to kill a hen.

* * *

Eggs for Hatching.—(R. J. S., Pasadena.) I would feel grateful if you would let me know in The Cultivator if it would do eggs "for hatching" any harm to keep them in an open cabinet. I have just made and fixed it in screen porch where the eggs will be exposed to the cold nights. The cabinet has three shelves, with holes bored to fit eggs large end down. I don't know if the change of temperature from night to day would render the eggs unfertile. Of course no rains can get at them.

Answer.—Eggs for hatching should be kept at a temperature of from 45 to 60 degrees. You are a better judge than I would be of the temperature of your porch at the different seasons of the year. I would greatly prefer keeping them in a more even temperature, as great changes are apt to hurt the vitality of the germ.

Could you not put your cabinet in a dark closet in your house or in a dry cellar? Also be sure not to keep them as you say with the "large end down." The little end should be down, otherwise the air space may float up to the "top side" and you lose the chick. It is very necessary to keep the air space in the large end, as I once realized to my loss.

* * *

Hens Not Laying.—T. H. M., Banning, writes that their eleven months' old pullets are not laying.

Answer.—There is something lacking in your hens' rations, some element of the egg is lacking. It may be the lime for the egg shell, in which case give more oyster shell or mix some lime in water as thick as pancake batter, let it stand twenty-four hours, then pour off about a pint of it on the ground in each pen. It will soon forms a dry cake on the ground. Crack a corner off each day for the hens to eat. Do not give them dry air-slacked lime; if they eat it they will die.

I think probably it is animal food they lack. A Plymouth Rock hen requires about six ounces of food a day. Divide in about this way: Three ounces of grain, one ounce of animal (bugs, worms, insects or meat) and two ounces of green food, preferably clover or alfalfa.

Sometimes a pullet will seem to need a slight shock or stimulus to start her laying. A week over feeding of meat will do that or a little red pepper for a short time, or one of the many egg condiments offered by the supply houses. A liberal supply of milk will often have the effect of starting the egg suply.

The combined Poultry Show of the Southern California Poultry Association and the Los Angeles County Association will begin in a large tent, or in three large tents rather, on the lot at the corner of Hill and Sixth streets, Los Angeles, next Tuesday afternoon. It will continue through the week and end at ten o'clock Saturday evening.

Large exhibits are promised from all sections of Southern California, and the poultry four hundred will be on dress parade and in their finest feathers.

Fanciers and utility men will enjoy a great week together.

The Los Angeles office of the Cultivator has been moved to 115 North Broadway, (upstairs.)

PRACTICAL INCUBATORS positively the best. Hatches more and stronger chicks. 10 YEARS' GUARANTEE

Cat. free. PRACTICAL INC. CO., 720 S. 11th St. San Jose, Cal.

THE OLD FOWLS.

What to do with the old hens is the question of the day. As long as they are shelling out eggs, of course, it is more profitable to keep them than to kill them. A hen not over two years old that proves an extra persistent layer is too good to kill, and should be kept over. But the main reliance for layers another winter, spring and summer must be the early-hatched pullets, and perhaps the hens of last year's hatching. All older hens have to go to pot before long, and the sooner they are disposed of after they stop laying in the summer. the better for the owner's pocketbook, and often for his comfort. For the fowls, old and young, are now beginning to crowd, and unless fed quite heavily, are bound to become troublesome and mischievous. If they can get into our gardens, fruit patches, tomato fields or melon plantations, there will be trouble. The easiest way out is to give them plenty to eat, so as to keep them laying as long and regularly as possible, or after that to get fat, and be ready for the block. Our experience is that we can gather the eggs in full supply as long as we supply the material, especially when we feed such nitrogenous foods as peas, soy beans, etc. Peas have seldom yet been appreciated as a poultry food and as egg-making material as they deserve. Bushel for bushel, they are worth, for that purpose, much more than is wheat, while frequently they can be bought for the same price, or even for less. Don't neglect a chance to buy peas for your fowls when they are easily worth $1 or more per bushel for poultry feed, as prices for grains are in these times. Soy beans are worth still more, but fowls do not like them so well, and a better way of feeding them would be to have them ground and used in mash form, with more bulky food. When you come to fatten the old fowls after their laying season, some corn should be added to the ration. In hot weather too much of this is bad for health. If rightly managed during the laying period, the old fowls are liable to be in good condition, and may as well be put on the market at once, and before their natural molting season.

POULTRY POINTS.

Q.—What causes roup in fowls?

A.—Damp hen houses, chickens crowding in small coops late in the fall, becoming warm at night, and catching cold when they come out in the morning.

Q.—What will it cost to keep a hen one year?

A.—From 75 cents to $1 a year. On a farm where the hens can have the run of the grain fields it will materially lessen the cost.

Q.—How many eggs should a good hen lay in one year under proper management?

A.—Upwards of 150 eggs. It will depend upon the strain of fowls you have. Some individual hens will lay as many again as others.

Q.—How can we select a good layer from our utility breeds?

A.—As a rule the hen with the small clean-cut head and a full bright eye and well developed in the rear part of the body will be a persistent layer.

Q.—Can a laying strain be bred up the same as a dairy cow?

A.—Yes, by using trap nests and watching your hens, and setting eggs only from the best layers.—Canadian Institute.

POULTRY NOTES.

When the hens are laying heaviest feeding is necessary.

An ounce of ground bone daily is sufficient for ten hens.

With all classes of fowls the early meal is of the utmost importance.

Fermented food is dangerous and is apt to produce disease like cholera.

Poultry powders are rarely required for fowls that are fed and cared for properly.

The secret in growing large, fine chickens is to feed often and but little at a time.

It rarely happens that two breeds of chickens or turkeys can be kept on a farm without getting mixed.

A little flax seed meal mixed in the food will help the old fowls to pass their moult quickly.

Air slaked lime dusted liberally around the quarters is cheap and will destroy lice, gapes and roup.

One important item in fattening fowls economically is to supply the food in a way that is easily digested.

If you are not keeping pure bred fowls, at least be sure to get pure bred cocks to cross on your hens.

If a fowl becomes sick, separate it from the others and doctor it, as the disease may be contagious.

Culls will come out with the best of breeding, but if they are slaughtered early in life they will not produce others.

Vertigo in fowls arises from a disorganized state of the digestive organs or from the heat.

Make the perches about eighteen inches from the ground, all of one height and four inches wide. Allow no decomposing vegetable matter, no filth or dirt of any kind around the house, yards or anywhere on the premises.

If soft feed or milk is fed in troughs care must be taken to keep clean, scalding out regularly; otherwise there is considerable danger of disease.

While there is no good reason why the farmer should not have as good fowls as the fancier, it is an exceptional case when it will be best to keep more than one good breed on the farm.

One of the principal advantages the farmer can have is that his poultry will cost him but a small outlay for food, because they can find the greatest part of their own living.

Feed good, clean feed and just enough to keep the fowls in good health and thrift. Do not feed too often or too much and always feed in a clean place and in a cleanly manner.

See all things, not in the blinding and deceitful glare of the world's noon, but as they will seem when the shadows of life are closing in.—Dean Farrar.

General Agricultural Notes

PLANT FOOD.

Of the sixty-three or more elements known to the chemists the farmer and orchardist deals with only fifteen, which are known to be essential plant foods. These fifteen elements are oxygen, hydrogen, nitrogen, chlorine, carbon, phosphorus, sulphur, silicon, sodium potassium, calcium, magnesium, aluminum, iron and manganese. The first four are gases, the next four are non-metalic solids, and the last seven metals.

Twelve of the elements of plant food including nitrogen are supplied to fruit trees from the soil through their roots. The elements taken from the soil are limited in quantity, and constitute only from five to ten per cent of the weight of the plants, while those taken from the air constitute from ninety to ninety-five per cent of the weight. It so happens that the farmer and orchardist have only to deal with three of those fifteen elements, for while the others are all more or less essential to plant growth, they are found in sufficient abundance in a state of nature to meet all the demands of plant life.

Nitrogen, phosphorus and potash are the three elements most frequently lacking in sufficient quantity in our cultivated soils. They have been termed "the golden tripod of agriculture," because upon them depends the success of farming.

The necessity for the application of one or more of these elements will depend upon several causes. It is not infrequently the case that one or more of these elements may be found in sufficient quantity for the production of the kinds of crops cultivated. When such is the case it is manifestly a waste of material to apply an element of which there is already an abundance in the soil.

Again, different crops require quite different quantities or proportions of these elements. It is therefore important that we should have some knowledge of what our soil contains, and the requirements of the crop we propose to produce.

It is also important that we should know whether or not the elements already in the soil or those we propose to apply are in an available form, in order that they may be available to the plant or tree. They must be more or less readily soluble in water for all plants take their food in solution. In a sense they drink but they have no power of mastication.

Another important element of plant growth is the decayed vegetable matter, commonly called humus, without which all soil is barren. Prof. Schuppe says that the relation of the humus to the soil that contains it may be summed up briefly as follows:

1. It is the natural storehouse and conservatory of nitrogen which element is the most expensive of all plant foods when it becomes necessary to purchase it in the form of commercial fertilizer.
2. It furnishes the food upon which the soil micro-organisms live and which by their functions, convert its organic nitrogen into nitrates.
3. It possesses a considerable amount of mineral food constituents. These, in the further decomposition of the humus, a process continually going on in the summer, are liberal in forms available to growing crops. We have reason to believe from recent research that the mineral humates furnish a large proportion of the potash, lime and other minerals used by crops.
4. It serves to increase the absorption and retentive power of soils for moisture.
5. It regulates and protects against extremes of soil moisture.
6. It opens up and mellows heavy soils.
7. It serves materially to diminish the loss of fertilizing elements by drainage, thus permanently improving in the best way light soils.

EXPERIMENTS WITH CORN.

Experiments with corn at the Nebraska Experiment Station have just been compiled and published as Bulletin 91. Tests of a number of varieties of corn in different parts of the state have been continued. Something over one hundred farmers are engaged in these tests. It was found that no one variety of corn is equally well adapted to all parts of the state. By dividing the state into six sections, it was shown that certain varieties yielded best in certain sections and other varieties in other sections. The yields obtained by each experimenter are stated in the bulletin.

These variety tests showed that corn raised in central and Western Nebraska produced smaller ears than did the same varieties raised in the eastern part of the state. It was also the case that varieties with medium sized ears yielded better under average Nebraska conditions than did large or small eared varieties.

Corn was planted sufficiently thick so that it could be thinned out to from one to five stalks per hill, 44x44 inches apart. On good soil with liberal moisture supply, three stalks per hill gave the largest yield of grain, although the ears were smaller than where the planting was thinner. Experiments indicate that towards the western edge of the corn belt two stalks per hill are better than a large number.

The plats of corn having the thickest stand had the largest proportion of barren stalks. On the other hand, suckers are more abundant in the thin stand of corn. These suckers serve a useful purpose in producing ears when the stand of corn is thinner than the soil and moisture can easily support. In regions of sufficient rainfall it would not seem advisable to remove the tillers in the hope of improving the yield.

Experiments with seed corn from different states and from different parts of Nebraska lead to the conclusion that seed corn should be raised as near as possible to the locality in which it is to be planted.

Seed corn placed in a dry seed room in the fall gave twenty per cent better stand in the field than seed corn from the same field that was left in the crib over winter.

ARE TWO AND THREE INCHES LONG—
BURBANK'S PHENOMENAL BERRIES
One will Fill a Cup. Dwarfs Giant Dewberry in Size and Excels Raspberry in Taste.
How to Get Hardy Roots.

The leviathan of the berry world is the latest California wonder, Burbank's Phenomenal Berry. Mr. Burbank has said: "It is larger than the largest berry ever grown." To those who know the conservative nature of the man his statements as to size and quality are the best guarantee that could be given.

It is a cross between the California Dewberry and Cuthbert Raspberry.

In color and flavor the new fruit closely resembles—some say "excels"—its rich-hued raspberry parent.

It's the Best Berry in the world
—LUTHER BURBANK.

Its liquid juiciness when pressed by the tongue surpasses the full-ripe dewberry in delicate consistency.

And most marvelous of all, to this toothsome fruit has been imparted a firmness which holds it in shipping conditions for days, making it one of the most practical berries for home or distant markets.

GROW IN HUGE CLUSTERS

The vines are inclined to trail. When properly supported, the berries are quickly and easily gathered. They grow in immense clusters of from five to ten huge berries, a sight to delight and amaze. No berry is so economical to pick.

We have grown a limited number of roots in our experiment gardens on Puget Sound, and can supply in quantities of one to one dozen.

The conditions under which these roots were grown insure that they are hardier and more robust than can be obtained from southern nurseries.

Use coupon in ordering. Price (prepaid) per root 35c; per doz. roots $3.
Order Now—The Supply is Limited.

LILLY'S KITCHEN-GARDEN COLLECTION OF BERRY BUSHES
Roots of 12 Standard Berries: 1 Logan Berry, 3 Raspberries, 2 Blackcaps, 2 Currants, 3 Blackberries, 1 Lucretia Dewberry, each one properly labeled, no two same variety. By express at your expense $1.00, prepaid $1.25. You can include one of the Phenomenal Berries at 25c when ordering this collection. Plant Lilly's Seeds

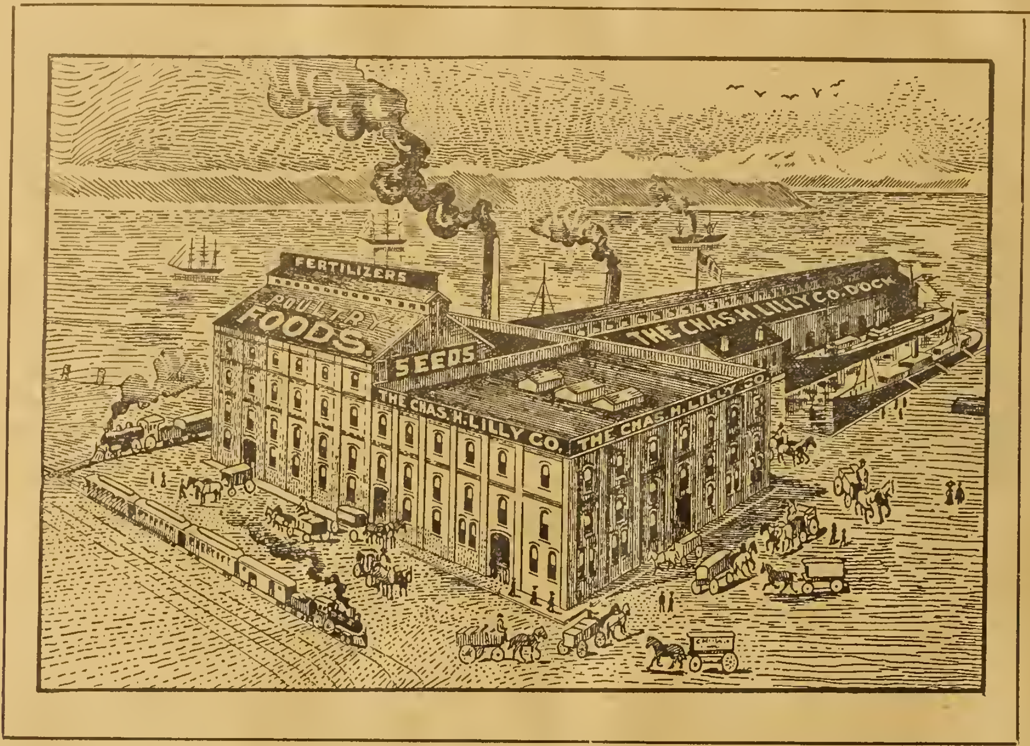
Seed Selection and Handling by Experts

"To sell two seeds where only one was sold before," is the motto of the Chas. H. Lilly Co., of 305 Market St., San Francisco. The position of this firm in the seed world is so unique that it is worthy of special mention.

In the handling, selection and development, of hardy northern grown seeds, this concern has reduced the business to approximately an exact science, with the result that they are able to supply the Farmers and Gardeners of California with every variety of seed with which the fertile soil of the various districts of the State will give growth.

This success has not been brought about without hard work, considerable research and much experimentation. It has required the constant effort of those at the head of this great seed business, for in the beginning there was little to work upon. Everything had to be created. While, on the one hand, the markets were being built up, the seed organizers, on the other hand, were preparing the system which was to supply the market with every variety which was adaptable to this climate—and it was no easy matter. But the work has been accomplished so well that The Chas. H. Lilly Co. is recognized as one of the foremost seed houses of California.

The development of Northern grown seeds has been especially successful. These seeds cost more to raise, sell for more money and give proportionately greater results than do the ordinary seed varieties.



FERTILIZERS
POULTRY FOODS
SEEDS
THE CHAS. H. LILLY CO.
THE CHAS. H. LILLY CO.
THE CHAS. H. LILLY CO. DOCK

The Chas. H. Lilly Co. are the owners of a mammoth plant, located at Seattle, where all seeds are cleaned properly by automatic Clipper Cleaners. The latter have over thirty different sized screens, which permit the handling of all kinds of seeds, small or large, light or heavy.

By the proper arrangement of these screens and the clever device for regulating the air blast, accuracy is gained in the uniform high quality of the seed when cleaned and recleaned ready for the market. Thus all foreign matter and defective seeds are easily removed.

In the seed House at the Plant, there are in all over fifty (50) people, not counting the Salesmen or the Clerical force. Ten expert Seedsmen, each one of whom has had years of experience in his special line of the business, are employed in assorting, cleaning and grading the seeds and in the careful work that is necessary in preparing them for the market. Four floors, with an aggregate space of over 45,000 square feet, are required to accommodate the preparation of "Lilly's Best Northern Grown Seeds."

Following the policy of Eastern firms, The Chas. H. Lilly Co. maintain, in connection with the Plant, a large experimental station where the qualities of the different varieties of seed are thoroughly tested before they are recommended for sale to the people.

One of the best catalogues published in the United States, is issued by The Chas. H. Lilly Co. It is free to all for the asking, and describes minutely some of the best things offered to the lovers of beautiful gardens and to students of Agricultural Economy.

Mr. A. H. Hankerson, is the genial manager, who is always ready to welcome the Company's friends, at 305 Market street, San Francisco, while traveling representatives visit every city, town and village in the State, and so the firm is kept in touch with the needs of the commonwealth. Mr. Lilly and the other officers of the Company are always ready personally to give their attention to such matters as may be entrusted to them.

In closing this article, we wish to call attention to the unexcelled facilities of the mail order division. Here prompt service is the motto, and those living at a distance can depend on the same treatment, as though they were at the store in person. Some of the best mail order men in the West are employed, so The Chas. H. Lilly Co. gives its patrons the best service.

CALIFORNIA POLYTECHNIC SCHOOL.

The State Polytechnic School at San Luis Obispo has engaged Mr. C. W. Rubel of Iowa, to be instructor in the animal and dairy industries. Hitherto, Director Leroy Anderson has been giving instruction in these subjects, but the administrative and other duties are becoming so exacting that he cannot devote sufficient time to these important subjects. Mr. Rubel is a graduate of the Iowa Agricultural College at Ames, in the class of 1904. For a year after graduation he held the fellowship in animal industry and assisted in teaching in this department. When it is understood that the Iowa State College has the largest equipment of livestock of any school in the country and possesses representatives of more than twenty-five different breeds, in addition to many animals of purely market classes, it will be seen that Mr. Rubel's opportunity for study has been the best. Much good will acrue to the school and to the state by his service. It is hoped that agricultural societies may call upon him to judge their livestock. He has already entered upon his duties at San Luis Obispo.

The Polytechnic School has just received three head of dairy Shorthorn yearlings from Iowa selected by Prof. C. T. Curtiss of the Agricultural College of that state. They are very promising young things—are registered and of excellent breeding. The dam of the bull in a recent test begun 210 days after calving produced ten pounds of butter in seven days. This is a good test considering that almost up to the time of the beginning, the cow was nursing her calf. In purchasing these Shorthorn the school hopes to test their dairy qualities in comparison with dairy breeds and to furnish stock for improving other herds. This type of animal is more popular than any other in the dairy farms of the coast section of our state and the advent of these well-bred animals is hailed with pleasure. We congratulate the school upon its interest in helping the dairy and stock industries so materially.

A GRAND SCHEME.

If it should be found practicable to store the mountain floods, especially during the season of heavy rains, not only can millions of acres of desert Western lands be made to blossom, but the states of the Mississippi Valley can be saved from the disastrous results of excessive floods. The movement is highly commendable.

Don't wait until tomorrow—it never comes.

Queries and Suggestions

BEST EARLY GRAPES FOR BRAWLEY.

Editor Cultivator: What is considered most popular and profitable for an early table grape to plant in this section?—J. W. H. Brawley.

Malaga is considered the best early table grape for your section. It has stood the test better than any variety over the largest section in the desert country. Black Hamburg has given good returns at Coachella, but the best reports are given of the Malaga.

ALSO IMPERIAL.

"Imperial" wants to know how Malaga, Black Hamburg, Muscat and Tokay will do in the Imperial Valley.

The two first named have done well on the desert, especially Malaga. Muscat cannot be recommended on account of its scant foliage, which renders the fruit liable to sunburn. This has been complained of on the "inside" even, some seasons, likewise Tokay. It is not a good shipper as the berries get loose around the stems which causes the fruit to spoil quickly, and also makes a mussy looking bunch. Tokay is still more tender and cannot be recommended for your section. It has been tried and found wanting in the Coachella district.

There has been started at the Mecca Date Garden, a large collection of table grapes and within the next two or three years there will be some valuable results determined which will be just what desert grape growers will need.

Put In New Pipe.

Editor Cultivator: I have "run up against" another problem that I fail to be able to solve. I have a pipe in my well for the purpose of pumping water. The pipe (I am sorry to say) is common black pipe, vice galvanized which I should have put therein. The water, as a natural consequence, tastes of the pipe. Now, the question is, what shall I do to prevent the water tasting of the pipe? Will it help matters any to take the black pipe out and put in its place galvanized pipe?

I have thought of several remedies, but in most of the changes the benefit might not be sufficient, so would like some idea from you.—A. B. G., Ukiah.

You had better take out the old pipe and put in new. Galvanized pipe will serve your purpose doubtless as well as a more costly kind, and last about as long.

Bad Digestion.

Editor Cultivator: We have a cow whose milk at times is stringy and lumpy. Her udder swells, becomes feverish and hard, followed by the condition of the milk above described. What shall I do?—Mrs. E. P., Riverside.

This trouble is often due to derangement of the digestive system, and sometimes to cold and changes in temperature. Give desert spoonful of nitrate potassium once or twice a day when affected or coming on.

Care of the Calf.

Editor: Will you kindly answer one question for me, which may be also important to others?

I have a calf from a fine cow and Whitting's bull, which is the best stock I can get. The calf is two weeks old and nearly ready to take away from its milk. What shall I feed it to bring the best results?

If you intend to take the calf from the cow you will have to exercise care at this time lest you produce unfavorable conditions in the calf. Feed warm cow's milk three times a day, about three pints at each meal for a month, now and then giving the calf a raw egg broken in the mouth so that the shell goes into the stomach. Do not over feed, but keep the calf always hungry enough for its meals. As soon as it can run on grass let it have a short feed daily, being careful not to allow it to eat so much as to produce diahorrea.

Moving Cattle.—Will you kindly let me know through the colums of your valuable paper the law respecting the shipping of cattle into Tulare County from Southern California? In doing so you will oblige a number of your subscribers, myself among the number.—W. A. W., Santa Ana.

Cattle can be shipped north during the months of November, December, and January by getting a certificate from either the State Veternarian, assistant state, or Government Inspector Hill.

TO PRESERVE EGGS.

Editor Cultivator: Please give me the best method of keeping eggs for a period of six or eight months. How do refrigerated eggs keep?—M .M. S., Santa Rosa.

Answer: The best method of preserving eggs has been found to be to keep them in cold storage at a temperature of about 45 degrees. They will keep good a reasonable length of time after being taken out of storage, but high temperature is harmful to all eggs, even fresh ones, and would be more so to those taken from a cold storage warehouse.

Since the cold-storage method is not available to many communities, it might be well to mention another method of preserving eggs that has been quite successful; viz., the water-glass method. Water-glass is silicate of soda or silicate of potash, the former being the cheaper. It is not expensive. If wooden kegs or barrels are used in which to pack eggs, they should first be thoroughly scalded with boiling water to sweeten and purify them. To each ten quarts of water, which should first be boiled and then cooled, add one quart of water-glass. Pack the eggs in the vessel and pour the solution over them, covering them completely. A cover should be placed on the vessel, making it air-tight if possible. If left uncovered, the solution turns into a jelly-like substance, and is apt to evaporate and leave some of the eggs exposed to the air. Keep the eggs in a cool, dark place. A dry, cool cellar is a good place. If the eggs are kept in a place that is too warm, the silicate is deposited and the eggs are not properly protected. Do not wash the eggs before packing, for by so doing you injure their keeping qualities.

Only perfectly fresh eggs should be used, for nothing will prevent a bad egg from getting worse, and such an egg will prove harmful to the good ones that may come in contact with it.

Eggs packed by the above method have been known to keep for fifteen months. The only trouble has been that when they are boiled the shells crack. All packed eggs contain a little gas and, when boiling, not finding a ready escape, bursts the shell. This may be prevented by making a pin-hole in the blunt end of the egg. To do this, hold the egg in the hand, place the point of a pin against the shell of the egg and give the pin a quick, sharp blow, just enough to drive the pin through the shell, but without further injury to it. For frying and other methods of cooking, where you first break the shell yourself, the eggs are all right.

DON'T TAKE A CHANCE

ARMOUR'S BLOOD BONE AND SINEW FERTILIZERS

with *cheap* fertilizers. Remember the analysis doesn't tell the whole story. Cheap materials, coarsely ground, careless mixing, poor mechanical condition show up in the orchard after your money and time are gone.

This is not a Bunch of Grapes

¶ This Picture (from a photograph) gives you a faithful idea of how the Puget Sound Special Tomato produces. ¶ This is an early dwarf, and yields large clusters of round, sound, luscious fruit. It thrives abundantly on the Pacific Coast. ¶ The Puget Sound Special Tomato has produced a most profound impression wherever it has been used. In the Puget Sound Country it has been yielding full ripe fruit as early as July 4th. The fruit clusters so prolifically upon the vine that from a distance it looks almost like a gigantic bunch of rich-red grapes. It tends to stand free from the ground like a tree; has hard, heavy, firm, round stalks. The fruit stands shipment splendidly. Its beautiful color and freedom from blemish makes it a favorite among housewives and restaurant keepers. ¶ Abundant yield renders it an extremely profitable tomato for the truck gardener. It sells in preference to any other tomato on the market. This tomato was perfected solely in our trial grounds at Brighton Beach and can be obtained only from us. Northern grown and hardy. Order now. This Puget Sound Special tomato will please you more than any vegetable in your garden.

Sold only in sealed packages. ¶ Price (prepaid) packet 10c, ounce 60c, lb. $6.

POOR LITTLE JOE.

Early in the morning he rises,
  And out of doors he must go;
Then out in the cold to milk
  Is the duty of poor little Joe.

When he feeds the cow to milk her
  And asks her politely to "soe!"
Almost before he knows it,
  She hauls out and kicks little Joe.

And there is the pig and the chickens
  And the turkeys to feed and Oh!
So awful many other things
To be done by poor little Joe.

And when his chores are done
  To school he must surely go,
And he is most always late,
  Then the teacher is angry with Joe.

He has no time to study at home
  And he misses his lessons, so,
At recess the boy that is kept in
  Is nobody but poor little Joe.

Now this is all of the trials
  Of this little boy I know,
Now, aren't you sorry, Aunty and Cousins,
  All sorry for poor little Joe?
  —Elmer Wheeler in Farm Journal.

Into Custody

From An Old Legend.

It is Christmas eve, and the snow lies deep upon the ground at Valley Forge. From the little cottage of old Michael Kuch a light shines cheerfully out across the wintry scene. Inside, he and his daughter Kate are sitting by the cosy log fire. The time passes. The big clock in the corner of the room strikes twelve and the old man and his daughter arise from their chairs and offer their evening prayer.

Michael Kuch prays for the safety of his only son, Albert, who is a trooper with Washington's army.

Barely have they arisen from their knees when the door of the room is burst suddenly in, and a panting, wild-eyed man stands before them. He is trembling from head to foot, as he hurriedly closes the door and sinks into a chair.

Father and daughter hasten over to him. "What is? What is it, John?" cries the girl, in great alarm, for the man is her betrothed.

"I shot at him—at the rebel, Washington. I shot at him, but missed—and killed one of his attendants," stammers the fugitive. "His men are on my track; give me shelter; let me hide," he implores.

Old Michael Kuch looks hard at the young man.

"I killed one, but not Washington; not the rebel chief; 'twas him I aimed at."

"'Twas a coward's act," condemned the old man. "Thou knowest that I am a neutral in this war, John Blake, though my boy be in yonder camp. I will not raise my hand against my king, but if I did, it would be in open war, not like a cowardly assassin, from some hiding place."

"Give me shelter; let me hide," implores the fugitive frantically; "I hear them, they are coming!"

The scrunching of horses' hoofs and the tramp of men's feet are heard in the snow outside.

"Quick!" cries the assassin, "or I am lost."

"Out here, then—to the spring-house, but remember, John, 'tis for my girl's sake, not thine; I despise an assassin."

Michael hustles the fugitive out at a rear door, and runs with him to the spring house. Then he hurries back to the house. As he enters again, the front door is flung wide open and a crowd of men in the blue and buff rush in.

"A murderer has come this way!" shouts a sergeant. "He killed one of our dragoons. We want him; where is he. Give him up, old man, or 'twill be the worse for thee."

"He is not in this house," calmly says Michael Kuch.

"But he came here; we tracked him in the snow."

"If ye tracked him, find him."

"He is here; give him up," cry the soldiers, gathering around the old man with threatening gestures.

Kate flings herself between them.

"What he says is true; only my father and I are in this house," she cries.

"Stand aside, girl. We are going to take this assassin. We know he is here—Out of the way, old man!"

At this moment the door of the room swings gently open and a tall, dignified-looking man in a general's uniform steps in. He carries in his arms the limp form of a dragoon, whose breast is dyed with blood.

"The General!" cry several of the soldiers, springing to attention.

"Washington," mutters old Michael Kuch to himself.

The officer lays the form of the man reverently on the little couch at the furthest side of the room, and then turns toward his men. As he moves, the light from the leaping flames falls for a moment on the fallen soldier and lights up his white features. Old Michael suddenly starts forward, and then falls on his knees at the side of the couch.

"My son! my son!" he cries, "he has killed him."

Then in mad haste, he leaps to his feet and dashes from the room.

Next moment he is at the spring-house.

His life shall pay for it," he mutters hoarsely to himself, as he faces the concealed man.

He draws his pistol and fires full at him, but quick as he is, the girl, who has followed him, is quicker. She dashes the weapon up with her hand, and the ball goes wide.

"He is mine!" she pants. "You shall not kill him!"

The soldiers have followed them from the room, and they drag the skulking assassin from his place of concealment. He is brought into the room, and faces the general.

"What harm have thy countrymen ever done thee, that thou should'st murder them?" asks Washington, with great severity.

"The ball was meant for thee; kill me," says the prisoner defiantly.

There is a stirring of the form on the couch, and one word, "Father," comes from the lips.

The dragoon is not dead.

His father and General Washington bend over him. They examine his wound.

"'Tis not fatal; he may live," says the leader, calmly. Then, turning toward the would-be assassin, he speaks in slow, measured tones:

"You are not yet fit to die. I will put you under guard until you are wanted."

Then, bowing to Kate, he continues, "Take him into your custody, my dear young lady, and see if you cannot make an American of him."

The clock strikes one.

And turning from the room, he leads his men away.

* * * *

Six months later two dragoons are fighting side by side in the Continental Army. They are Albert Kuch and John Blake.

COLDS, THEIR CAUSE, AND REMEDIES.

What is commonly termed a cold, or in more severe case influenza, is caused by a clogging of the pores of the skin, usually from a chill, and the waste matter that should pass off through the pores seek other avenues of escape and causes inflamation of the mucous membranes, inflamed or sore throat and congestion or inflamation of the lungs.

For the relief of these unpleasant and often distressing symptoms, open at once every avenue of waste, the pores by a warm bath, or the old-fashioned "good sweat," and as the largest pores of the body are in the soles of the feet, our grandmother's recommendation to "soak your feet" should be followed. If the bowels do not move freely move them, preferably with an enema or bowel injection of warm water, and increase the action of the kidneys by drinking all the water posible. By taking this treatment upon the first symptoms of a cold, it may usually be broken up. But if inflammation has set in strongly it will be a day or longer before the mucous membranes can throw off the waste that has been thrust upon them.

Should a feverish state be added to the other symptoms one should remain indoors in warm, but well ventilated rooms, of an equable temperature, or at least protected from draughts, until the fever subsides.

When there is no fever, out-of-door exercise will greatly expedite the cure. Deep breathing of pure air will assist as nothing else can in clearing the inflamed membranes and air passages, and also by purifying the blood as it passes continuously through the heart and lung cells for that purpose.

From the cause and the remedies suggested preventive measures should suggest themselves. If the skin is kept perfectly clean by frequent bathing, the pores will not become clogged; if the bowels move freely and regularly, there will be no demand for another outlet for the wastes of which they should dispose, and the same is true of the kidneys. And if accustomed to taking out-of-door exercise daily there will be little danger of becoming chilled.

Proper diet is necessary also, for if food is eaten that contains little or no nourishment for the body it simply clogs the digestive tract and all the organs are overworked to dispose of the additional waste.

Only as much food should be taken, and of such kind, as is necessary to sustain the body properly—to build up anew the tissues that are being constantly worn away. When this lesson is learned the human family will enjoy much better health and longer life, because the body will not be weakened or so soon worn out as when thus overtasked. When we eat to live instead of living to eat, we will not be constantly seeking something to pamper unnatural appetites, nor searching the cook's pantry for dainties to please a cloyed palate, regardless of its effect upon the digestive machinery and our health.

A simple diet of cereals, milk, fruits and vegetables, eaten with as little preparation as possible, is most conducive to health and longevity.

But to return to the subject of colds, whose unpleasant symptoms may also be relieved by local treatment with home remedies.

Hot herb teas of sage and pennyroyal, and also ginger tea, will help to bring on the perspiration that will freely open the pores.

For sore throat apply a cold compress—a cloth wrung out of very cold water, folded three or four times, placed over the throat and held there by being pinned to a close covering of flannel of two or three thicknesses, which should extend around the neck and be securely fastened with a safety pin, and also pinned to the clothing to hold it in place. Gargle the throat well with a solution of chlorate of potash, or if that is not at hand, with borax water or strong salt water. But chlorate of potash should be kept on hand for the purpose.

If there is a tight feeling or soreness in the chest, it is a symptom of inflammation, and a cold compress should be placed there also. Should this fail to relieve, try a mustard plaster, made by stirring equal parts of corn meal and mustard into the white of an egg to form a paste, which spread on half of a piece of old or thin white muslin, turn the other half over it, place on the chest and cover with two thicknesses of flannel. Keep this on until it burns unpleasantly, then remove the plaster, rub the skin with cold cream or vaseline and put a piece of clean muslin under the flannel.

When catarrh is present leave a piece of alum on the top of a hot stove until it dries out into a white mass, then powder it and use as a snuff. Also snuff up the nose occasionally a solution of salt and water, strong enough to be felt but not to smart unpleasantly. This is more efficacious taken as a nasal douche.

Cough mixtures are of no help, as they so quickly pass by the affected parts into the stomach, and syrups of any kind are an injury, adding to the waste the body is trying to throw off.

A swallow or two of quite strong salt and water will often stop the cough of a child in the night, probably because of the coming up towards the throat of worms from the stomach, with which children are often troubled and which the salt water drives back.

Cookery Recipes

Here is a recipe for making a delicious black fruit cake: Cream together two pounds each of butter and brown sugar, add the yolks of twenty-four eggs, beat thoroughly and stir in one pint of unfermented wine. Seed eight pounds of raisins and cut them in halves; add to them four pounds of cleaned currants, two pounds of shredded citron, and mix thoroughly with one cupful of flour. Two pounds of flour should be measured and sifted for the cake, and the cupful mixed with the fruit should come from this. With the remainder of the flour mix thoroughly two ounces of grated nutmeg and two teaspoonfuls of cloves. Stir the fruit thoroughly into the butter and sugar mixture, and then add alternately the stiffly-whipped whites of the eggs and the remainder of the flour. Add a little molasses to make it a little more moist and black. This quantity of ingredients will make two very large loaves baked in tin pans.

* * *

PENOCHE.

Melt up two cups light brown sugar with one-half cup milk, and stir all the time over the fire until it will form a soft ball in the water. Add butter the size of half an egg, beat up briskly until it cools and begins to thicken, then turn out in buttered plate, and cut with a knife into pieces of size desired before it is quite cold. Adding about two tablespoons of grated chocolate, or a half cup of chopped nuts makes a fine candy also.

* * *

PEANUT BRITTLE.

Stir two cups sugar in a frying pan over the fire until it melts and boils up well, then add two-thirds cup coarsely chopped peanuts and cool on a buttered plate, cutting in squares before it gets too cold, or it may be broken up afterwards.

* * *

CHOCOLATE FUDGE.

Grate or cut off with a knife about two squares from a cake of chocolate, melt it up with two heaping cups granulated sugar and one milk and boil until it forms a soft ball in water. Add butter size of walnut, heat until it begins to thicken and cool on buttered plates, cutting before it is quite cold. Chopped nuts greatly improves this.

HOMELY HINTS.

Colic—Colic is one of the most annoying ailments with which small children are afflicted. No one is ever alarmed about it, but the pains distress the little one and cause cries, which worry the mother and disturb other members of the family. The difficulty is that gas accumulates in the stomach and bowels, which distend the organs and the pains are distressing. If this gas can be removed the child is immediately relieved. An old-fashioned nurse says that she used a safoitida in such cases. She dissolved a small quantity of the drug in a teaspoon of hot water and when it cooled sufficiently, gave it to the child. The gas would soon be belched up and the child relieved, would fall asleep.

* * *

Cleaning the Hair—Many find it difficult to wash their hair during the winter without catching cold. In such cases the hair and scalp may be cleaned with corn meal. First loosen up the hair, then take a small handful of cornmeal and rub it thoroughly on the scalp. After the scalp has been covered with it, the hair itself may be rubbed with it between the hands. The greater portion of the corn meal may be shaken out and the remainder is easily brushed out. This method is a satisfaction to those who fear to wet the hair during cold weather and also to those having heavy hair which is hard to dry.

* * *

Patching—As soon as garments show weak places, put a patch under before the cloth is worn through. It is thus much easier to get the patch to fit, and the garment looks neater than when the patch is allowed to show.

THE MISUNDERSTOOD GIRL.

She is to be found everywhere, in all classes of society—and to recognize her is to avoid her. Nothing is more fatal to the peace and happiness of a community or household than to count a "misunderstood" girl among its members. As a rule they are not misunderstood at all, but, on the contrary, are understood far too well, for they are taken at the valuation of the many, which is more likely to be true than that which is set by the individual herself upon her own character.

A misunderstood girl is often a selfish, always a foolish, girl; for if she is clever she will soon discover the reason why she is not a domestic success.

In some instances we are really misjudged, in the same way as we often misjudge others. But, as a broad rule, the judgment formed by the world—or rather that small portion of it in which we live—is more often the true one.

"Nobody loves me at home; they don't understand me," the "misunderstood" girl will say, with a melancholy smile, and thinks herself well deserving of the pity and sympathy of her friends. But is she?

You are filled, perhaps, with the desire of improving your own mind; you love the study of poetry, art or literature, and you are extremely ruffled when your sister begs you to assist her in retrimming an old dress, or to take the younger children out for a walk. Don't you think you could put down your book with a good grace, help your sister and at the same time interest and amuse her with an account of your reading?

One day you are keenly interested and excited over an article in a magazine, where your own ideas are brought out in powerful language. You rush down like an avalanche and pour forth a volume of talk upon the head of your favorite brother who has just come home tired from a hard day's work, and then you are angry and hurt that he takes no interest in the subject and wonders what on earth you are excited about.

The truth is you are not misunderstood—you are incorrigibly selfish.—Woman's Life.

STAND UPRIGHT.

There are many things in the lives of women which tend to develop the carriage of the body anything but upright. If a girl has any pride in being upright in body as well as in morals, she can, even if she has an occupation which tends to make her crooked, do much herself to prevent it. In the first place, carefully cultivate the sense which tells her when she is standing straight and when she is not. By paying attention to this muscular sense it becomes in time very acute. By neglecting it, the sense becomes dull—is paralyzed. Cultivate it daily for several times a day by assuming the upright attitude. Stand before the glass and see when you are straight, or get a friend to tell you, and then put yourself in this attitude whenever you stand or walk or sit at any labor in which you are engaged. If you have only to walk across the room, do it in an upright attitude. If you have only to stand and converse with a friend in the street, on the road, at a party, get yourself so accustomed to the upright habit that you will feel uncomfortable in any other way. In time an upright habit will be established, and constant attention to it will not be required.—Dietetic Gazette.

Bobby (to his stout uncle)—Gee! Uncle, couldn't a fellow have a fine Christmas dinner if he was as hungry as me an' as roomy as you?"—Brooklyn Life.

ACCEPTED.

A colored fellow at Wellington, says Harry Woods, was smitten by a dusky maiden, and, not having the courage to propose face to face, called her up over the telephone. When he got the proper party on the line he asked: "Is dat Miss Johnsing?" "Ya-as."

"Well, Miss Johnsing, I've got a most important message to ask you."

"Ya-as."

"Will you marry me?"

"Ya-as. Who is it, please?"

Willie—"Mamma, I dreamed last night that papa gave me a bicycle for Christmas and you gave me a watch."

Mamma—"But, Willie, you know dreams go by contraries."

Willie—"Then you will give me the bicycle and papa the watch?"—Town and Country.

Be good—if you can't, be careful.

"Dependable Furniture at a Fair Price."

True Mission Furniture

The Old Mission styles of furniture are the most favored and the most used now. The plain, simple lines and the peculiar finishes of the weathered oak and the dark rich mahogany are decidedly pleasing and are in strict keeping with the bungalow form of architecture which is so popular in this section of the country. There is a greater diversity of style and finish even in these special lines and just as great an opportunity exists for inferior workmanship. The mission furniture from the factory of the famous craftsman, Gustav Stickley, is acknowledged to be the finest in the country—made entirely by hand even to the smallest parts and every joint is mortised and pinned and made to fit perfectly We are agents here for this superior furniture and constantly carry a large and selected stock. All mail orders given prompt attention.

Woman's Breast and Man's Lips

Most Common Places for Cancer

[San Francisco, Cal., Dec. '05]

The papers made mention a short time ago of people cured of Cancers without knife or pain by Dr. and Mrs. Dr. Chamley & Co. Since that time the cures of so many prominent people have been the occasion of great comment.

They all said their cures were marvelous beyond expression, many of them having been given up to die. They first obtained the Doctor's free book, which teaches that any lump in woman's breast is Cancer, it led to, as they say, the greatest blessing of their lives.

All the leading newspapers and medical journals of the world have noted their success and wonderful cures. They charge nothing until cured.

It is said they have cured more Cancers than any doctor living. No X Ray or other swindle. They probably have the best 50-cent book ever printed on Cancers and Tumors, sent free only to those who describe their case. Their address is 25 Third St., San Francisco, Cal.

Los Angeles Markets.

Los Angeles, Jan. 4, 1906.

The continued cool, dry weather has hardened prices all along the line, especially butter and vegetables. Eggs have declined since last week, but they are expected to again advance unless warmer weather intervenes. Poultry is scarce and eagerly taken. Butter is from 2 to 3 cents above last week's quotations, and unless rain comes soon, another rise is predicted. The continued heavy frosts, while apparently doing little damage to fruits, has proved injurious to vegetables and prices are up on all varieties.

HOW TO GROW ORANGES.

R. M. Teague, the San Dimas nurseryman, is out with an attractive booklet entitled "How to Grow Oranges," which has a fund of information which makes it well worth sending for. It also has information regarding the trees to be had at Mr. Teague's nurseries, the varieties of buds, the roots or foundation stock, conditions of planting, care, etc.

Mr. Teagae recently informed the writer that he has this year a fine lot of trees in all varieties, and of the very finest condition. Some as fine as ever set at remarkably low prices. It goes without saying, however, that the price will not be as low as last year.

Much of desirable stock has already been sold for future delivery, and wise planters are already "binding the bargain" in new orders nearly every day. day.

By writing Mr. Teague at Box 88, San Dimas, further information may be had; also the little book "How to Grow Oranges."

IT'S PENNY WISE

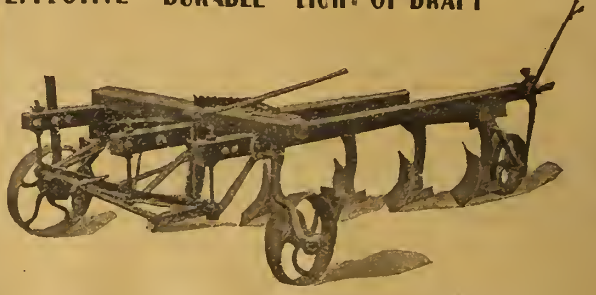
Stockton Reversible Gang Plow

EFFECTIVE DURABLE LIGHT OF DRAFT



This is our regular Plow and Land Shifter and Rear Lever. Land Shifter simple and durable. It is in easy reach of operator and there is no danger of wheel running over foot.

Houser & Haines Mfg. Co.
Stockton, Cal.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pumphead using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

$3.75 Per Dozen for Six Weeks Old Chicks

ADVANTAGES OF COULSON'S SPECIAL READY MIXED CHICK FEED

PUT SOME LIFE INTO THEM

You who are raising chickens and turkeys, and more especially young chicks. Don't you think it a good idea to PUT SOME LIFE INTO THEM, that is giving them food that will MAKE THEM STRONG AND HEALTHY?

You don't want to see your chicks droop around as though they were HALF ASLEEP, and then find every morning that 15 or 20 of them have KICKED THE BUCKET.

You know there is something in the heart of a grain of wheat or corn, that the mere heat of the soil makes it sprout into a living, growing plant.

You know there is something in the yolk of an egg, that the mere heat of hatching turns into a living chick. Sometimes there is not sufficient of the life-giving quality in the egg and the chick dies before it is hatched; and sometimes they hatch out more dead than alive, and the chicks drag out a miserable existence for a few days and finally give up the struggle, stretch out their legs and die.

There are many secrets in nature, but it is written in the Bible, "Seek and ye shall find." Suppose you should find this "something" that you could just feed it to the young chicks and give them STRONG VITALITY, so that they would grow—to beat anything you had seen before.

IT'S THE LIFE GIVING QUALITIES in Coulson's Food—THAT'S WHY Coulson's Special Dry Chick Feed raises the NICEST, LARGEST and HEALTHIEST CHICKS.

Coulson's Special Dry Chick Feed puts the life into them and makes strong, healthy chicks.

That is why Coulson's Food is different from the imitations.

A prepared Chick Feed composed of sound, selected grains broken to the proper size and blown free of dust is the most economical feed for young chicks. One hundred pounds will feed as many chicks as two hundred pounds of ground grain or cracked wheat. Why is it preferable?

The proper feeding of poultry is without doubt the most essential factor in the raising of any kind of poultry for profit.

Considerable advancement in the feeding of poultry has been made in the past few years, especially in the feeding of little chicks.

On nearly all the large poultry farms chicks are now started entirely on COULSON'S SPECIAL READY-MIXED DRY CHICK FEED.

AT ARMOUR PACKING CO., KANSAS CITY.

Loading cars of 400 bags of freshly cooked and baked hearts and liver meal. The small pieces of cook meat (about the size of a pin head), is used in Coulson's Special Chick Feed It is fresh, sweet and tender, and is great stuff to make chicks grow. If you want to raise a nice bunch of chicks, get a sack of Coulson's Special Dry Chick Feed.

SAVE YOUR CHICKS

Keep them from bowel trouble and all ailments incident to the first five weeks. Profit lies in the chicks you raise to maturity—not in the number hatched. Give them a ration that makes healthy, well developed bodies.

Coulson's Special Chick Feed

Contains ingredients that long experience in poultry raising has found best adapted to give nourishment to growing chicks. It is promptly digested; causes no indigestion; keeps the bowels in normal condition. Chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first five or six weeks. Save your chicks and make good profit.

Remember Mr. Bassett sold broilers only 6 weeks old for $3.75 a dozen.

TRY IT THIS YEAR.

Ask your dealer for COULSON'S SPECIAL CHICK FEED. Tell him no other kind is good enough for you. You want the best, and that's Coulson's.

Special Prizes to users of Coulson's Special Dry Chick Feed.
$500.00 to be given away. Look for a little envelope in every 10-pound sack of Coulson's Special Chick Feed.
Ask your dealer for Coulson's.

The Inoculation of Leguminous Plants

By Karl F. Kellerman, Physiologist, and T. R. Robinson, Assistant Physiologist, U. S. Department of Agriculture.

Farmers' Bulletin No. 240.

The method of distributing practically pure cultures of nitrogen-fixing bacteria dried on cotton has not proved entirely satisfactory owing to varying conditions of air during transit in the mails and to certain matters connected with laboratory technique. While the number of unsuccessful attempts to secure inoculation by users of cotton cultures sent out by the Department of Agriculture is small, it has been recognized that the methods of preparing the organisms and distributing them were open to improvements. Investigations have been under way for some time with a view to improving the methods followed, and as a result the Department is now prepared to send out bacteriologically pure cultures in small tubes hermetically sealed.

The experiments carried on by the Department of Agriculture have demonstrated the fact that by the proper use of practically pure cultures the nodule-forming bacteria are actually carried into the soil. These bacteria are able to form root nodules, and where other conditions are favorable the inoculation thus brought about makes possible the growth of a legume in soils where it had failed previously from lack of bacteria. The original cultures used, however, must be prepared with the utmost care and with a view to preserving or increasing their natural power of nitrogen fixation rather than merely to make them grow under favorable conditions.

* * *

When Inoculation is Desirable—(1) If a soil is low in organic matter and has not previously borne leguminous crops.

(2) If legumes previously grown on the same land were devoid of nodules.

(3) If the legume to be sown belongs to a species not closely related to one previously grown on the same soil.

* * *

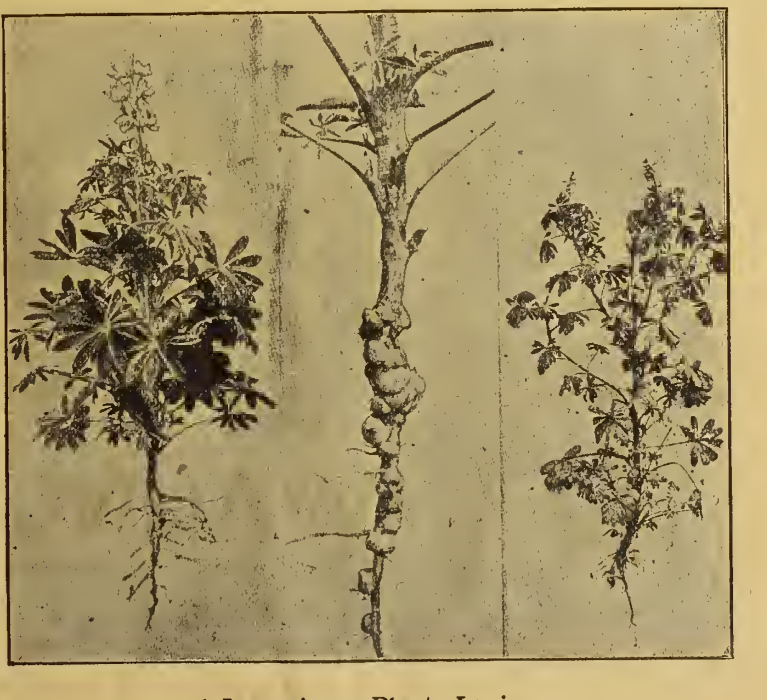
When Inoculation May Prove Advantageous—(1) If the soil produces a sickly growth of legumes, even though their roots show some nodules.

(2) If a leguminous crop has made a stand but gives evidence of failure, due to the absence of root nodules. Under such conditions it is advisable to apply the culture liquid by spraying or, better, by top-dressing the land with soil moistened with the culture liquid, as explained in the directions.

When Inoculation is Useless—(1) If the legumes usually grown are producing average yields or the roots show nodules in abundance.

(2) If the soil is rich in nitrogen. It is neither necessary nor profitable to inoculate a soil rich in nitrogen; few nodules are formed under these conditions.

Cultures of nitrogen-fixing bacteria are not to be regarded in the light of nitrogenous fertilizers, increasing yields under all average conditions. The bacteria do not contain nitrogen. If conditions are favorable, they render nitrogen obtained from the air available for the legume.



A Leguminous Plant—Lupine.

First Flowering Showing Tubercules Second Flowering

* * *

When Inoculation Will be a Failure—(1) If the directions are not studied intelligently and followed carefully.

(2) If the soil is acid and in need of lime. Liming to correct acidity is as important for the proper activity of the bacteria as for the growth of the plants.

(3) If the soil needs fertilizers, such as potash, phosphoric acid, or lime. The activity of the bacteria in securing nitrogen from the air and rendering it available to the legumes will not take the place of such fertilizing elements as potash and phosphorus.

It must be remembered that inoculation will not overcome results due to bad seed, improper preparation and cultivation of ground, and decidedly adverse conditions of weather or climate. Before attempting to inoculate a new crop, the farmer first should inform himself thoroughly concerning the proper handling of the crop itself; otherwise failure is almost certain. As an illustration, sowing alfalfa on hastily prepared land, on land foul with weeds, on acid soils, or soils underlaid with hardpan is contrary to accepted practice. Free publications covering the essential points in growing all common legumes may be obtained from the State experiment stations and from the United States Department of Agriculture.

* * *

Keeping Cultures for Future Use—The possibility of farmers keeping cultures from one year to another has been suggested. This practice is not to be advised in any case. For good results it is necessary to start with a fresh, pure culture. The pure culture, moreover, can be prepared only by a trained bacteriologist with laboratory facilities.

* * *

Confusion of Nematode Galls With Nodules—Nematode galls, or root knots, are often mistaken for nodules, which they resemble in apearance. The nematode gall is extremely injurious, and in regions where it has been known to exist it is unwise to plants crops favorable to the development of the pest. Nearly all of the legumes should be avoided. This is important not only because the legumes susceptible to nematode attack are themselves injured, but chiefly because they furnish conditions favorable to the rapid development and multiplication of the nematode worms, and these may become a serious menace to succeeding crops or to orchard stock, which, under ordinary conditions, they would scarcely injure. There are, however, some resistant varieties upon which the nematode worm can not develop, and in infested regions these resistant varieties should be used exclusively. If a leguminous crop with its roots covered with what are apparently nodules makes a sickly growth, or if there is doubt as to whether a legume is inoculated or infested with nematodes, samples for examination should be forwarded to the Department of Agriculture.

* * *

Danger in Inoculation by Soil Transfer—Very satisfactory inoculations have been obtained by transferring soil from old fields where legumes have grown, but there are dangers incident to such soil transfer which should be avoided.

The source of supply should be very definitely known, and in no case should soil be used from fields which have previously borne any crops affected with a fungous disease, a bacterial disease, or with nematodes. Numerous animal and plant parasites live in the soil for years and are established in so many localities that it is manifestly unwise to ship soil indiscriminately from one portion of the country to another.

Of scarcely less importance is the danger of disseminating noxious weeds and insect pests through this plan of inoculating by means of natural soils. Even though weeds may not have been serious in the first field, the great number of dormant seeds requiring but a slight change in surroundings to produce germination is always a menace.

If soil is to be used, however, whether obtained from nearby fields or shipped long distances, the evidence should be clear that the soil is free from the objections mentioned above.

BY J. W. MILLS, POMONA, CAL.

GRAPE QUESTIONS FROM BELOW SEA LEVEL.

Editor Cultivator: What is the best grape for culture here. If you were going to plant grapes at Imperial (table grapes) what variety would you plant? If you were going to plant 80 acres of table grapes would you plant it all to one variety; if not, what varieties and what proportion? Will Malaga grapes color in Imperial Valley? What other varieties will color well and are good shippers? Can Muscats be grafted over to Malaga successfully? What distance apart should Malaga grapes be planted, how far apart for wagon roads and how far apart should wagon roads be? How long should the rows be?

SUBSCRIBER, Imperial.

As far as we are able to determine at this time, Malaga grapes seem to be the best. This is experience of actual experimenters in the Valley down to this time. There may be other varieties that will be more profitable. Experience alone can tell. There is an experimental vineyard at Mecca, at the Date Garden, which is on sandy land with clay strata every few inches. There will be a collection of the best table grapes at two points near Mecca on the heavy land, and one eight miles east of Imperial on moderately heavy Imperial soil. If we were going to plant 80 acres to grapes in the Imperial Valley, we would be like the proverbial Irishman and "not do it" unless some local demonstration warranted such an enterprise. If Malagas show that they are profitable, we would plant them to a limited extent, remembering that one or two seasons do not prove anything. Wait and see what the experiments now under way demonstrate, and then there will not be so many disappointments. An individual can experiment in a smal way, but when it comes to devoting broad acres to such work it becomes expensive.

Muscats may be grafted over to Malagas very readily. The Malaga is the strongest grower of the two and there will perhaps be a difference in the vigor of the growth of the Malaga after being placed on the Muscat root. This, however, is only conjectural, as we have never seen the trial made. The fact that Malaga and Muscats are so nearly alike should make their affinity an assurance.

If Malagas color in the Imperial Valley, they will have to change their nature, as they are naturally a white grape. Should they show a tendency to change and put on color, there will be a rare chance to develop something new that would have the promise of great value. We cannot tell what varieties color well in the Imperial Valley. That is to be determined.

Malaga grapes, being very vigorous growers, they should be planted not less than ten fet apart. The usual distance for ordinary growers is eight feet. Avenues for driving through should not be less than fourteen feet. With the rows ten feet apart, the avenues should not be more than thirty rows apart, twenty would be better. Experience shows that double rows are more convenient than squares. If, instead of planting in ten-foot squares, the vines be planted in rows five feet apart and the vines five feet apart in the rows, alternated with driveways, the same number of vines per acre is calculated by they would be much easier handled both at plow time and at the harvest, as the greater part of the plowing and cultivating could be done with heavy teams, and wagons could be driven any place in the vineyard at harvest time, spaces between every two rows being fifteen feet wide. It may be that Malaga grapes will make strong enough growth in the desert country to trellis in order to get the best results. In that case sunburn could be easily reduced by the vines being close together in the rows. By training the vines on the wires all in one direction the tops or outer ends of the vines may be trained over the bearing portion of the next, which is near the trunk, thus providing double protection. The number of vines per acre is calculated by multiplying the distance between the rows by the distance between the vines in the rows, and dividing 43,560, the number of square feet in an acre, by this number. If the vines are 10 feet apart, there will be 435 vines per acre. When planted in double rows 5 feet apart in the rows, and the spaces or avenues 15 feet wide, there will be the same number of vines per acre.

It is hardly practical to irrigate rows longer than 40 rods, and 20 rods is a better length. The length of irrigating furrows should be determined by the slope of the land. Land which has a slope of over 20 feet to the mile will wash rapidly with furrows over 300 feet long.

* * *

TOKAY ON TRELLIS.

Editor Cultivator: I would like to ask if Tokays may be properly grown on trellis and if so, how should I prune them? I find that the Tokay does better with me than any other variety, and I would like to know if there is any fertilizer which I can use to give them a better color. I have so many green ones.—J. R. U., Tropico.

The Tokay grapes may be grown on trellis, but it will require considerable water to properly grow them. If the vines are pruned long, as they will have to be if grown on a trellis, a larger number of bunches will set than when pruned in the usual way. The vine is a very vigorous grower and will grow very well on a trellis. Two branches will be sufficient to start with after the first year, and these may be increased after the vines get older. There should be about three buds left on each year when the canes are cut. This will be very sure to give two good canes the following year. Should more than two grow, one should be removed early in the summer before the young growth gets to be over six inches in length. When pruning time comes again, leave the cane that is situated the highest on the vine and trim the lower cane to three buds as before. Watch this spur during the early summer and do not allow more than two canes to mature. When pruning time comes again, cut off the cane that was left long, as low down as possible, which will be to the point above where the two new canes grow. This brings the crown of the vine down to the lowest level and the two canes of the past season's growth will give material to repeat the operation. Another way to secure a long vine for trellis is to train a cane over the trellis and prune the canes that come out at intervals along the branch, just as you would a young vine. This main branch should not be allowed to grow its full length the first year, but cut it back to about two feet the first year and allow it to extend from year to year. We prefer this method of trellis growing the Tokay to the first described method. The Tokay should be pruned with about two more buds to a spur than the Muscat.

We know of no fertalizer which will give Tokay grapes a darker color.

* * *

GRAPES FOR VENTURA.

Editor Cultivator: Will you please tell me what varieties of table grapes are best suited to our light gravelly soil? What varieties are most desirable for the Los Angeles market? What varieties should be grown for the winery? Please mention names of buyers of table and wine grapes to whom I could write for more detailed information.—M. W., Moorepark.

good table varieties for sandy soil. For wine grapes, Pedro Jimines will do for sherry. Carignane is a good upright grower and prolific. It makes a good red wine of the port type. Charbono is a very productive variety, producing from five to ten tons of grapes per acre. Alacante Bouschet is a very prolific grape and is useful as a coloring grape.

Address the manager of the Italian Vineyard Company at South Cucamonga for information along these lines. The most attractive grapes on the Los Angeles market are Purple Cornichon, Tokay, Malaga, Muscat, and Black Morocco. This last variety should do well with you.

* * *

A JULY PEAR.

Editor Cultivator: Can you mention in your paper a pear that will ripen in this locality in July? My Madeline ripens early in June, Lawson last of June, and Bartlett the first of August. I want a pear to ripen between Lawson and Bartlett. How is Dearborn's Seedling?—X. Y. Z.

Dearborn's Seedling is a good one. Beurre Gifford is also another good pear. These two come in at the season you wish. Annie Ogereau is another good pear that ripens in the period during which you are lacking pears.

AGRICULTURAL EDUCATION.

The farmer boy or girl comes to the public school with fundamental economic, social and educational needs that should be met with special training in agricultural lines. The teacher comes to the public schools with new ideals of education that make the industrial element an essential of sound education and with an abundance of material for useful instruction in agriculture. Surely old time traditions and prejudices cannot long bar the way to the effective teaching of agriculture in our public schools.

But some one rises up and says it will cost too much to give farmers' children such instruction in the public schools. I cannot believe that such an argument will have much weight with the American public in general or with the California public in particular.

No doubt we must pay more for our public schools in the future than we have in the past. We must have better school houses, better trained teachers and more apparatus and illustrative material, and we must pay the bills for these things. But it has been proved over and over again that education of the right kind promotes industrial wealth as well as the general well-being of mankind. And if the states where the public school system of the past, with all its limitations and defects has been most thorough in its work have been the states where the general level of material prosperity has risen highest, and no man who knows the facts will deny this, surely it is reasonable to expect that an education which aims directly to promote industrial efficiency, as the new education does, will more than pay for its increased cost by the increased wealth which it will produce. If literary education has been a very profitable investment for the American public, industrial education is likely to prove a bonanza.—A. C. True.

Four hundred ranchers of the Westminster district in Orange County, have forwarded a petition to President Roosevelt asking for an investigation into the appropriation of the waters of Bolsa Chica Bay by the Bolsa Chica Gun Club as a shooting preserve.—Compton Enterprise.

THE USEFUL TOAD.

The common toad renders notable service to farmers and gardeners throughout the entire growing season; yet to many its worth is unknown, while to others it is even an object of disgust, if not of fear. It must be admitted that to some the toad can never be an attractive animal. Nature has denied it the gay colors of bird life or even the sinuous beauty of some of its reptile relatives. Yet, judged by the standard of good works, the toad does not suffer by comparison with any of the lower animals.

The toad has always borne the burden of false and even ludicrous misrepresentations, and these traditions are to be met with even in this era of progress, and coupled with them we hear of the equally surprising ability of the toad to produce warts on the hands; to poison infants by its breath; to bring good fortune to the house in whose new-made cellar it takes up its abode; and, finally, to cause bloody milk in cows if killed by accident or design. The writer well recalls the shock his credulity received when in the inquisitive stage of boyhood he faithfully tested several of these superstitions with only negative results. When so much that is false has been written about the toad it may not be amiss to increase the scanty literature of facts concerning this humble servant of man as determined by a somewhat intimate acquaintance extending over a decade or more.

The belief that the toad is venomous probably arises from its habit, when disturbed or roughly handled, of ejecting through the skin a certain milky acrid fluid. No harm attends contact with the fluid on the hands, but dogs attempting to bite toads show signs of discomfort, and even distress, due to this acrid secretion. That the fluid is not objectionable to all animals is shown by the avidity with which certain hawks and owls capture and eat toads.

The toad is of direct service to man by reason of the noxious insects which it destroys. Should it feed on beneficial insects, it would be to that extent an injurious animal. There is only one way to determine accurately to what extent an insectivorous animal is beneficial or injurious, and that is by careful examination of the contents of a sufficiently large number of stomachs collected at different dates and over a suitable range of territory.

A thorough investigation shows that their food consists of: Ants, cutworms, thousand-legged worms, tent caterpillars, ground beetles and allies, weevils, miscellaneous caterpillars, grasshoppers, crickets, spiders, sowbugs, potato beetles and allies, carrion beetles, miscellaneous beetles, snails, angleworms, vegetable detritus, and gravel.

THE WALNUT.

Over $10,000,000 is expended annually for nuts in the United States, and California supplies but $300,000 worth, provided the season is not too dry and the trees do not suffer in that state from a drouth.

An 8-year-old English walnut tree will produce 100 pounds of nuts, which sell for 12½ cents a pound. About 100 trees are set to the acre, which makes the nut a profitable crop. In planting English walnuts, it is understood that the second generation must be secured, as the third, fourth and fifth generation will not produce. This is an important point which experimenters must not overlook.

COW PEAS draw nitrogen from the air in large amounts, if sufficient POTASH and phosphoric acid are supplied to the plant.

The multitude of purposes served by the remarkable cow pea, are told in the 65-page illustrated book, "The Cow Pea," which also tells of the splendid results obtained from fertilizing cow peas with POTASH. The book is free to farmers for the asking.

Story of California's Finest Walnut Tree

The beautiful picture seen on the cover page of this issue is from a photograph of the largest, most productive and best shaped walnut tree in California.

It is known in this vicinity as the Chase tree, Mr. Chase being the owner for many years past.

When I became interested in this tree Mr. Chase gave me the name of a man who could give me a history of it. I wrote to him, and here is his reply:

Dear Mr. Rideout:—Yours at hand, and ,will say that the Chase walnut tree in question was planted in 1886 by Mr. Van Vorce, who bought all his walnut trees from Niles of Los Angeles, the thoroughbred stock raiser. Niles obtained his French seed from Gillett, the Barren Hill nurseryman, who had already imported five or six varieties grown in California, from France. The Van Vorce trees are all seedlings from French nuts and show several of the French varieties. As the tree in question is not grafted, it could not be termed a distinct variety, but comparing the nuts with the Mesange it answers the description in every detail. My young trees here in Sonoma County, planted from the Chase tree, bore last year and this, and show no sign of the disease or scab, while the other walnut trees here were nearly ruined by it this year.

I already have a fine photograph of that tree which I brought up with me nine years ago to accompany a sack of seed walnuts which I sold here for 50c per lb.; much obliged, just the same, for your offer to send me one.

Yours truly, C. L. WHEELER.
Sebastopol, Cal.

These Trees Were Grafted Last March on Yearling Roots.

Judging from this letter I am led to believe that this particular tree is a Mesange, but be it whatsoever kind it may it is a remarkable prodigy, towering far above its fellow trees as does Mt. Blanc above the other peaks of the Alps. With a perpendicular sun this tree would cast a shadow 60 feet across. I leave it with the readers to judge the height. These orchard trees were planted 40 feet apart and the limbs of the adjoining trees have been intertwining for several years. If this tree had had plenty of care, water and space, it would have been much larger.

The leaves are very broad and the foliage protects the nuts from the sunburn causing so much loss to the grower when the crop is nearly matured.

I consider this the best proposition before the American people. Here is a monster tree, free from dead wood, free from sun burned nuts, unharmed by the bacterial disease, very prolific, bearing yearly an enormous quantity of fine flavored nice sized soft shelled walnuts.

I would recommend planting these trees 60 feet apart with one in the centre of every square and as soon as the limbs begin to interfere cut out the centre ones, leaving a perfect orchard of hardy trees.

There have been more orchards in this vicinity planted from this tree than from any other ten trees.

I have leased this tree for a term of years, having to give for the nuts and one thousand grafts ($50) fifty dollars per year. At the end of the last year of the lease I agree that the following nut crop will be (300) three hundred lbs., its average yearly output, and if it falls short of this amount I am to replace the difference in exchange prices. I further agree that if I kill the tree by cutting grafts therefrom I am to pay the owner ($500) five hundred dollars, and have given a bond to that effect. Below is what our inspector says about this tree:

This is to certify, that I have examined the walnut tree known as the Chase tree, and I find it apparently free from bacterial disease, and nuts of fine quality.

WM. WOOD,
Horticultural Inspector.

* * *

Another Proposition.. For the people who are in districts where the bacterial disease is very severe, I have a remedy, I think. As the non-rust wheat was obtained in this way, why will this not prove a panacea for the walnut disease. I have a tree standing in a very badly diseased orchard that is absolutely immune, and has proven itself to be so for several years. Any time during the walnut season can be picked from under the trees on all four sides a bucketful of diseased nuts and the branches are badly scarred also, but not a trace can be found upon this particular tree.

A spot appeared upon the shell of a nut and was tagged and watched, but if it was the disease it did not reach to the shell. Mr. West, hired by the State to study the disease, and myself went down to see the tree and cut the spot from the nut and it was only on the surface. This tree is an even bearer and the nuts are a little larger than the average, but its stronghold is in its power to resist the disease. I have the nuts and grafts from this tree also. None of these for sale till next year.

* * *

Another Variety. The Placentia Perfection seems to be to Southern California what the Franquette is to Central California, very popular.

Last year I grafted quite freely to this kind and got several thousand grafts. Mr. C. W. Leffingwell secured the bulk of these before the summer was over, but I yet have a few smaller sizes for sale. The Placentia Perfection is noted for its smoothness, large size and excellent flavor, being greatly prized and sought after by the confectioners for its sweetness, being easily cracked, leaving a very plump and perfect kernel.

I will have some choice two year old trees from 8 to 15 feet, seedlings, and grafts to offer next year.

I promised a nurseryman to secure him some Placentia nuts for planting but not caring to part with any of mine I went to Placentia to secure them, but the nuts from the grafted trees there were so rough and ill shaped I could not account for them, so I took a handful over to the man who originated them and asked him if those nuts were Placentia Perfections and he said they were and the reason of their being so rough was that during the pollenizing season they were affected by the hard shell, there being so many in that district. I did not buy but concluded to spare a few of mine. I secured mine from a grafted orchard in our vicinity that has no hard shell near to contaminate them.

I also have secured the nuts and grafts from a tree known as the Gold Medal Tree, reputed to have taken the prize at the Paris Exposition.

I do not know very much about this tree as the former owner has gone abroad to live, but they are beautiful. large nuts and the tree is nicely shaped but farther than this I know nothing.

I believe the grafted tree is the only kind to plant, and I consider it cheaper at $1.00 and $1.50 than the seedling at 30c or 50c. But the prejudice against them is vanishing as it did against the soft shell when it was introduced.

I was very successful in my budding and grafting this year, as can be seen from the picture of my grafted nursery. Other standerd varieties kept. I sell my trees at the market prices and orders wil be booked as they are received. I also keep a general line of citrus, deciduous, ornamentals, berry bushes, etc. Here is what the commission merchants, Minton & Robson, say about the Improved Gardena Dewberries:

"We handled the Dewberries for Mr. Rideout, and the returns he received compel us to believe it is a good and safe investment to plant the berries for the market."

MINTON & ROBSON.

I wish to say that these gentlemen dealt very squarely with me last season and I was well pleased with the returns they sent, also with Marx & Son. I did not ship much to any other firms last season but as I got so severely bitten the other two years, I wish to say a word or two here that will help to spare some other poor unfortunate the same abuse.

No matter who you ship to or what amount you send, have them give returns at least once a week; six times is better. They will do so if you insist, and you must insist. Do not let them get slack about it, either. They can render statements every day, for every day they sell your goods for the cash, and their commission will justify the extra work.

One word to my customers that purchased berry bushes last year and year before: If for any fault of mine your bushes did not grow, remember I will replace them free, though I feel perfectly safe in making this offer. If the express company was at fault, report the same and I will look it up, but if you had bad luck through your own fault and wish another trial, I will make you a discount on another order.

I have a fine lot of choice plants this year now ready for delivery, of Improved Gardena Dewberries, Brandywine Strawberies (Kellogg Strain) and all other varieties, at market prices.

All questions answered and will show the trees or bushes to any person who calls on any day except Sunday.

Respectfully yours,

A. R. RIDEOUT, Whittier, Cal.

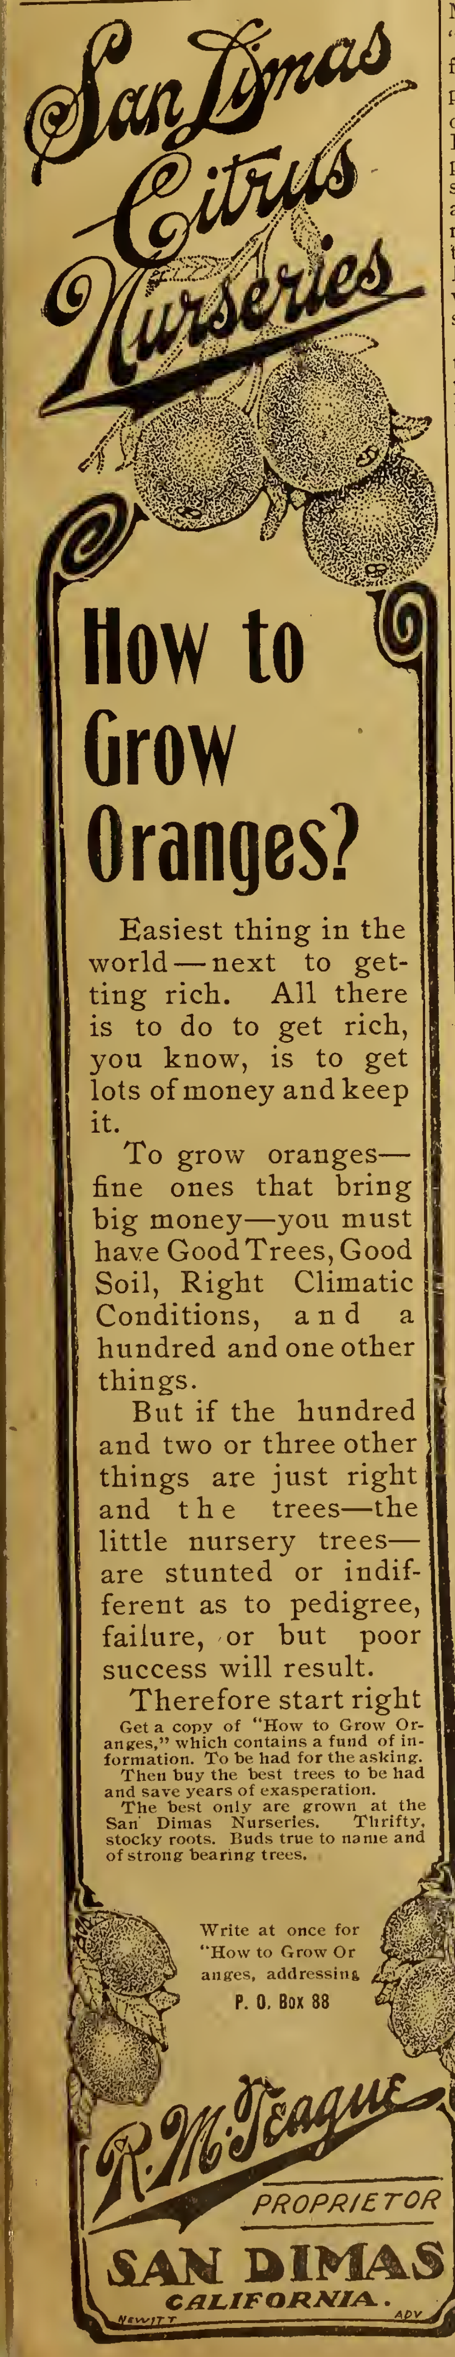
Prize.
Immune.

John Isaac, secretary of the State Horticultural Commission says that there is yet plenty of time for fruit trees to make a good crop, as they do not need so much water early in the season. "There is no reason" he says, "why fruit growers should be in any way discouraged, as there is still plenty of time for an abundance of rain."



San Dimas Citrus Nurseries

How to Grow Oranges?

Easiest thing in the world—next to getting rich. All there is to do to get rich, you know, is to get lots of money and keep it.

To grow oranges—fine ones that bring big money—you must have Good Trees, Good Soil, Right Climatic Conditions, and a hundred and one other things.

But if the hundred and two or three other things are just right and the trees—the little nursery trees—are stunted or indifferent as to pedigree, failure, or but poor success will result.

Therefore start right

Get a copy of "How to Grow Oranges," which contains a fund of information. To be had for the asking.

Then buy the best trees to be had and save years of exasperation.

The best only are grown at the San Dimas Nurseries. Thrifty, stocky roots. Buds true to name and of strong bearing trees.

CITRUS FRUITS

THE CALIFORNA POMELO.

In "The Citrus in California," bv B. M. Lelong (1900) we find that in 1897 "a number of growers and shippers from different sections of the Southern part of the State" collected a number of samples of different verieties of Pomelos for testing as to their comparative merits. The verdict of this self-constituted jury gave first place to a fruit described as follows: "flat, round, heavy and of a delightful 'bitter sweet' so much enjoyed in the East. It has quite a few seeds, but very little "rag" or waste, running in sizes from 42 to 80 to the box."

In 1901 a committee appointed by the Farmers' Club Institute of the previous December, on Pomelo Nomenclature, carefully examined all varieties of Pomelo brought before it and thus described this same variety; "Nectar, dense, firm texture, peel smooth and bright, pale lemon color, oil cells small and numerous, size 42 to 80, abundant juice, vinous, excellent, bitter element distinct. Highly recommended for market."

The name of this variety is not important in this paper as there are several names given to practically the same type and practically of equal value. In reporting the work of this committee one California paper said: "Ask an Eastern fruit dealer and he will say 'California grapefruit is no good.' "

Some years ago I shipped a few boxes of Pomelos in a car of oranges and they were sold in Philadelphia to a leading fruit dealer. If I recollect correctly, he paid the munificent sum of $2.25 per box and sold the fruit from $2.00 to $3.00 per dozen. In criticising the fruit to a relative he said this was the best he had had from California.

During the season of 1903-4 my fruit had become so well known locally as to find ready sale at remunerative prices. The secretary of our local exchange desired I should make a shipment to New York, as he thought I ought to find a market there for such fruit as I was producing. Acting under his advice, I shipped perhaps two hundred boxes and the lot was divided between Philadelphia and New York. That sold in New York brought me about 10 cents per box, while the Philadelphia fruit brought, I think, 40 cents per box, both f. o. b. the packing house. Thus far I have given you "just facts" and now, in acordance with the request of the Editor am to give you my opinion.

First let me ask you why did fruit which will command $1.50 to $2.00 per box locally sell for but 10 cents and 40 cents in New York and Philadelphia? And may it not be for the same reason that "Eastern fruit dealers" condemn "California grapefruit" as "no good."

I am convinced that if we could exterminate all Pomelos other than those of the type named and the seedless, California Pomelos would soon rank with Florida's. I believe all these to be commercially worthless. If we consult the grower as to the value of the Pomelo, we will hear different expressions. If we put them all together we will conclude that the consensus of opinion condemns the fruit as worthless commercially; yet we will find that several growers are getting fair returns, but not enough to cover the losses of the balance.

Some time ago, in talking with a buyer, I remarked "I have been asked to write a paper on the Pomelo; would I be justified in saying that three-fourths of the Pomelos raised in California are commercially worthless? "His answer was "Yes sir," three fourths, if not seven eighths. What do I mean by commercially worthless? I mean that it has no commercial value—will not sell on the market for a remunerative price.

At the time of the publication of the findings of the Committee on Nomenclature above noted it was found that one special variety was characterized in part as "Size small, 80's to 150's, running heavily to the latter, sweet and fine flavor, not recommended for marketing purposes."

This publication brought a protest from a grower of this variety. It is true the flavor is fine. It is true I have handed specimens, properly peeled to be eaten out of hand by persons who had not "learned the fad" and did not like Pomelos because they had never eaten any, and who pronounced them fine, etc. But the size is too small for the market. There is no use quarreling with the trade because it will not take our small sizes, it won't, at a paying price and that's all there is to it.

One of my neighbors was raising a well-known and usually (at that time. popular variety and under the impression he had a good thing budded several trees and set out a small grove. Next year he budded them to oranges. They were not the right shape. Some nursery men are still cataloging this variety for sale.

If we raise Pomelos for family use or to give to our friends there are several varieties to be highly commended. I have one variety which I have had rebudded (but have saved two trees for my own use). When it was proposed, at that same committee meeting to condemn this variety as "not recommended for market" a lady fancier protested that "the flavor was delicious." The chairman saved himself by substituting "not generally known."

The Nectar Pomelo

I have on several public occasions made demonstrations of the Pomelo, ways of using the juice, etc., and have always used a much despised (for market) variety. I have carried many a basket of the same kind and shipped many a box to friends who would appreciate them. I could not afford to ship them with expectation of other recompense than "thank you" and I always got that. But the Easter buyer will not take them at a price that will allow the grower anything.

The market wants a fruit not smaller than 80's and prefer to stop at 64's. A fruit flat-round that will cut up with two halves that will each set on a plate cut side up. A fruit that grows spherical or pear-shaped is not desired. Now there are several varieties (so called) whose similarity in types would seem to warrant the bunching of all under one name. These, with the addition of the seedless, comprise all there is of intrinsic value among California Pomelos. If all other varieties were budded over, so destroyed as producers of their old varieties the general value of the California Pomelo would not be "no good."

There seems to be a general opinion that California cannot produce the Pomelo equal to Florida. Want of critical knowledge compels me to be slow to make assertions. But so far as my knowledge goes I claim this fruit comes mighty near being as good as Florida's though possibly not equal to it. And I am quite sure there are several other groves whose products will join with mine to sustain California's right to hold up her head.

I had the pleasure to receive a letter from a purchaser of my fruit informing me that shipments had been made to three different points, a box in each case, and that the response in each case was "best I have tasted" or "best I have eaten." In these cases

TIME TO MAKE SELECTIONS.

This is the month when catalogues come with their tempting array of new flowers; when we wish for a long purse so we can buy all the lovely things they contain. Some of the beauties we think we must have, and now is the time to select and plant the garden of 1906.

CHANGE IN RURAL SCENERY.

The demands of improved farming which require the cutting of scattering field trees and the clearing or dispensing with fence rows are rapidly denuding the older farming sections of much that formerly gave character and beauty to the landscape. At the same time, extension of electric lines is pushing the suburban home far out and bringing new elements and possibilities into the country landscape. These same trolley lines bring hundreds of homes into new prominence. Many a quiet country home is suddenly brought under the critical observation of hundreds of travelers in a single day, and the bareness and landscape poverty of some of these homes is sickening.

NATURE STUDY.

Should there not be such a course of study for our schools as will serve the best for acquiring knowledge, providing dicipline and in assisting the child, his teacher, and his parents in determining what his vocation should be? Every branch of science is in some way represented in the environments of the child reared in the rural districts. The study of agriculture embraces nearly all of the natural sciences. Neither of the last statements warrants the use in elementary schools of the so-called nature work to that degree that the study of plant life should stand out clearly as botany nor that the study of animal life should be so systematically taken up that it might be mistaken for college zoology. If the pupil is aided in securing the names of objects and a few facts about them, there is little need for anxiety. If the habit of observing is formed in the elementary grades, the work in the high school becomes a great pleasure to the pupil and teacher. In the high school investigation and experimentation is added to observation; here classifications are made and relations discovered and studied.

OUR VALUABLE CONIFERS.

Three of our pines, the great sugar, yellow, and Jeffrey pines—all very valuable as timber trees—are the largest and tallest of the family of pines, often over 200 feet in height and 10 to 12 feet in diameter, larger than any foreign pines. Five of these pines bear longer, or heavier cones, with larger seeds, than are found elsewhere. The sugar pine—our forest queen, located on the middle heights of the Sierras—often has cones pendant, laden with seeds, fifteen inches to two feet long.

The Coulter pine of San Bernardino and contiguous mountains bear cones weighing eight or ten pounds. The gray-leaf pine, bordering the Sierra foothill regions, bears cones three to four pounds in weight. The Torrey pine, limited to the high bluffs near Del Monte to 20 miles north of San Diego, yields cones two pounds and over in weight.

Two of our native spruces attain enormous height and dimensions. The graceful Douglas spruce of the Sierras and Northwest grows from 300 to 450 feet high, with a trunk often 8 to 12 feet in diameter. From this tree are made telegraph poles, fence boards, railroad ties, piles for wharves, and piles to be placed under the foundations of heavy buildings in partially made lands, masts for ships (foreign and domestic), and most of the flooring and studding for buildings. A spruce in the San Bernardino Mountains bears a cone five to seven inches long and three to four inches thick—the largest of its kind known.

Our two world-renowned redwoods often can be found 300 to 320 feet in height, with a diameter of from 20 to 35 feet, still growing and bearing aloft their noble crowns—not exactly hoary, even after reaching three to five thousand years. These two species of redwoods—commonly so called—the sequoias—are the only two survivors on the face of the globe, but the fossils of the coal deposits reveal about fifty extinct species.

AGRICULTURAL CLUBS IN RURAL SCHOOLS.

There has been a decided movement in rural schools in the last few years toward educating children in the common things of every day life. This has resulted in some states in adopting nature study work; in others, in the including of elementary agriculture among the studies taught; and in others, the pupils have organized, under the direction of the teacher or superintendent, into clubs for the purpose of learning about the things which surround the child on the farm.

The object of the work is to teach and to interest the children of the rural schools in plant and animal life; to teach them to appreciate the beauties and opportunities of country life. Last year there were 375,000 children in the rural schools of Ohio. The education of the majority of these children will end with the rural school and a very large part of them will remain in the country to make the agriculture of the future. They will have to deal with the farm crops, the farm animals, the weeds, the birds, the insects, every day of their lives; and the object of the College of Agriculture is to get them interested in these things; to teach them about them. It is not proposed to replace any of the studies that are now taught, but to form clubs which will serve as an adjunct to and supplement the work that is now being taught.

The first essential in taking up the work is that the teacher shall be in sympathy with the work and will encourage and assist the pupils in their club, and the success of the movement will depend upon the teacher. Pupils are naturally interested in the things with which they are constantly associated and only need the encouragement of their teacher to take up the work enthusiastically. The most ideal condition for the work is to be found in the centralized township schools. Here the pupils of the township are brought together and enough of them who would be glad to take up the work can easily be found to form a club. In the district schools of townships having a township superintendent, clubs may be organized as a township club with members from the different schools. In the district schools, which do not have any township supervision, and this class represents the larger part of the rural schools, clubs may be organized by the teachers and even though they only have four or five members the first year, it will be found that efficient work can be done, and if successful, many more will want to take it up another year.

STERILIZING GREENHOUSE SOILS.

Sterlization of the soil by heating is a very effective means of preventing or controlling the worst enemies of greenhouse plants, and this method is now used with success by many large market gardeners. The method is especially effective in case of lettuce drop, timber rot of cucumbers, Rhizoctonia of lettuce, cucumbers, etc., damping off, and nematode root disease, all of which are common diseases in greenhouses. As would be expected, the treatment is effective only with diseases transmitted through the soil and is without influence on diseases disseminated through the air.

Soil sterilization has been practiced on a small scale, mainly for experimental purposes, for many years, but its application on a large commercial scale has been quite recent. Attempts have been made to apply the method out of doors, but it is mainly applicable and is used with most success in greenhouses. Various methods of sterilization and forms of sterilizing apparatus, using either steam or hot water, have been proposed and tried. If hot water is used the treatment must be repeated each year; if the steam treatment is thoroughly applied it is said to be effective for several years.

THE ANAHEIM EVERGREEN NURSERIES
Tim Carroll, Prop.
Anaheim, Orange County, California
The Oldest Nursery in Southern California
Established 1868 by the Present Owner.
Palms, Pines, Acacias, Cypress, Camphors, Eucalyptus, Guavas, Budded Loquats and all kinds of Ornamental Trees. Be sure and visit the Nurseries. A cordial invitation to all. Nurseries, 200 yards west of Loara Station, S. P. R. R. Our fine Illustrated Catalogue free. Write for it.

In the Vegetable Garden

POTATO SCAB.

The potato scab can be readily and cheaply controlled.

Corrosive sublimate is the best remedy known as yet. Bordeaux mixture is promising.

Ground once infected with scab will retain the germs for several years and treating the seed for such ground will not be as effective.

The treatment causes not only a more salable product, but within proper limits an increased yield.

Corrosive sublimate, 1 part to 2,000 seems to be as effective as 1 part to 1,000. The latter strength is preferable as the solution gradually loses strength.

The best length of time to soak the seed is about one and one-half hours. A longer soaking may lessen the scab still more, but it reduces the yield.

VEGETABLES IN SCHOOL GARDENS.

Much has been said about the school garden as a factor in teaching elementary agriculture. The average farmer boy is pretty familiar with gardening operations before he has been long in school and he knows quite well what a good garden is. It will be very difficult for him to come from a fine garden at home with very much enthusiasm to a small patch on the school grounds, exposed to the depredations of uninterested or malicious schoolmates.

If he wants a garden of his own he can have it at home for the asking, where conditions are such as to insure success. But if he is required to grow a garden on the school grounds against adverse conditions he will be pretty sure to rebel very effectively against the task. Then, too, the country children who are old enough to understand instruction in agriculture are beginning to take great interest in the larger operations on the farm.

What then shall the country school garden be? First of all a place for experimentation and illustration regardless of the value or quantity of the things produced. We may grow vegetables without having a vegetable garden and learn from them many interesting and profitable things. A grass garden containing a large variety of cultivated grasses and forage crops would not only be instructive to the children, but would be a valuable object lesson to the whole community.

New varieties of fruit may be purchased and set out in the garden where they may be tested for the whole school district. This would save many dollars now wasted annuallv by farmers who buy novelties that are loudly advertised by the traveling agent, but which usually prove to be worthless. The setting of trees, vines, shrubs and bush fruits would afford valuable lessons to the children, as would their subsequent care, training, pruning and protection. Grafts and cuttings could be made in the winter and set out in the spring, thus teaching the art of propagation. A few simple outdoor experiments, touching on soil texture, soil moisture, fertilizers and soil inoculation could be performed here.

SOIL INOCULATION AT SCHOOLS.

Children can see the tubercles on the roots of plants as easily as grown people. They can also see the effect of tubercles on the growth of plants and can imagine the presence of microscopic organisms fully as easily as grown people. What more does any man know about the subject unless he is a specialist in the use of the microscope and in knowledge of bacteria? Such a mystery, the results of which can be easily seen, is just the thing to place before a child to arouse his wonder and interest and to make him an enthusiastic observer and experimenter. It is the commonplace things that everybody knows that children soon tire of and that should be avoided. In this work the garden may be used for the purpose of bringing insects near to the school house for purposes of study. Thus, while we would not care to try to produce a crop of cabbage or potatoes on the school grounds, we would want the plants in our garden so that we could easily study the cabbage worm and potato beetle. A great deal of the value of the fruits in the garden would consist in the fact that they would bring their insect enemies and fungous diseases close to the school where they could be studied very profitably.

POPCORN EAST AND WEST.

The growing of popcorn is not general. It is in a sense a special crop, and like all special crops it is grown usually in certain centers which are known to have a more or less marked adaptation for its worth. While popcorn is grown in centers both east and west, some difference prevails in the methods followed. One would imagine also that there would be considerable difference in the net profits owing to the amount of fertility which the eastern growers usually apply to land and to the greater labor which he usually spends upon the crop.

In the West popcorn is more frequently grown in rows or drills, and is cultivated but one way. In the West it is in a manner necessary to plant it in squares in order to give the necessary cultivation to the land which is likely to insure a good yield. If good crops are to be obtained on New England soil, for instance, everything has to be done by way of cultivation that can be done to stimulate growth in the crop, otherwise the yield will not be sufficiently abundant. The western grower may get a fairly good crop of corn though growing along with a fairly good crop of weeds owing to the nature of the strong character of the soil. Of course, the weeds that are thus present make it all the worse for the next crop or crops, but they do not greatly reduce the yield of the crop that is being grown.

The eastern grower applies in some instances as much as 1.200 pounds of fertilizer per acre; while the western grower usually applies none. One almost wonders how there could be competition under such conditions, but it ought to be remembered that the market in the East is somewhat better than in the West, and that the eastern grower is more willing to put ample work on the crop than the western grower.

Of course, the number of growers of popcorn will always be relatively limited. While it is used to a considerable extent, yet the amount required in proportion to that of ordinary field corn in infinitesimally small.

It can best be grown on good, clean clay loam or sandy loam, the latter to be preferred when it is possessed of sufficient fertility. The crop can be kept clean more readily when it is planted in hills, the hills being square; hence, all things considered, this method of growing it is to be preferred to all others. One would naturally suppose that the yields would be much less than those obtained from other corn, and yet if the hills are not placed more than three feet apart each way anl if a reasonable number of stalks are left in each hill, a good crop should yield from 75 to 100 bushels per acre.

Strawberry Plants
"Saltzer Everbearing," $3.50 per 1000; also Divided Arizonas, $3.50 per 1000.
F. M. Williamson, R. F. D. No. 1, San Diego, Cal.

BRANDYWINE PLANTS
Brandywine Strawberry Plants for sale, Kellogg's strain. No better nor thriftier plants grown. Clean of all disease; at bottom prices.
G. W MULLENDORE, COVINA, CAL

IMPROVED GARDENA DEWBERRY
And all other kinds of Berry Plants.
Nursery Stock for sale.
A. R. Rideout, Magnolia Nursery, Whittier, Cal.

Berry Plants
Brandywine Strawberry, Cuthbert Raspberry, Crandall Blackberry and Loganberry Plants.
Toluca Nursery. Toluca, Cal.

STRAWBERRY PLANTS
Saltzer Everbearing, $3.50 per 1000
T. M. WILLIAMSON, R. F. D. 1, SAN DIEGO

Vigorous Strawberry Plants
For Sale. 100.000 Excelsior and 300,000 Brandywine. Stock direct from R. M. Kellogg last April. Also Red Raspberry Plants.
R. De Young, R.F D. No. 1, Pasadena, Cal.

BERRY PLANTS
100,000 Brandywine Strawberries (Kellogg strain) $3.00 per 1000. 50,000 "A 1" Strawberry Plants, $3.00 per thousand.
50,000 Gray's Gardena Dewberries, $8 per 1000.
Raspberries, $8.00 per 1000.
Loganberries, $8.00 per 1000.
All raised on virgin soil and first-class plants.
A. E. HARRINGTON
R D. NO. 6 LOS ANGELES, CAL.

STRAWBERRY PLANTS
(TROPICO BEAUTY)
The very best Brandywine stock at low prices for sale by the grower,
D. Griswold, Box 25, Tropico, Cal.

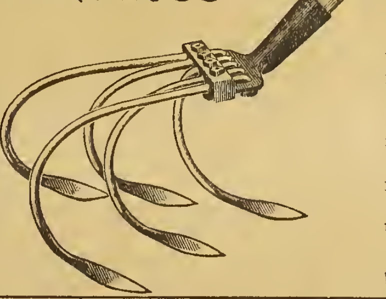
THE
NORCROSS



An Adjustable Garden Cultivator or Spring Tooth Hoe,
One of the most perfect tools for the cultivation of all kinds of garden plants ever offered the public.
OVER 100,000 IN USE.
It retails at $1.50 and is worth that price every day used in ONIONS, STRAWBERRIES, and other small plants.
It is adjustable in width by sliding the top plate.
It will work between rows or center blade can be removed and straddle row.
If not at dealers sample tool will be sent on receipt of price.
An Agent wanted in every locality. Most attractive terms to Agents and Dealers.
IRA D. BROWN
Western Distributing Agent, San Fernando, Cal.

Greatest National Bank West of Denver and South of San Francisco
First National Bank
United States Depository for Government Funds
CAPITAL, $1,250,000.

The reclamation of millions of acres of Western lands by irrigation is no longer a sectional issue; it is a national one. It is time that the subject should receive that attention its importance demands. It is legitimately the work of Congress. That body should attend to it.

* * *

What the President Might Do—Suppose the president had followed the advice of the tariff reformers, who are seeking without judgment, to have all our schedules remodeled, and had recommended to congress in his message the repeal of the many things advocated by these disturbers, as for instance the schedules in the Dingley law relating to hides and coal which the governor of Massachusetts demands shall go on the free list.

And suppose that Canadian farm products should be permitted to come into the United States and to "mingle with our American products," as practically advocated by Governor Cummins of Iowa, in his inaugural address two years ago.

And suppose an effort should be made to strike down the trusts and monopolies by a general assault upon the tariff, removing duties from all things made by monopolies.

And suppose sugar from the Philippine islands should be put on the free list, the labor in producing such sugar being furnished by Chinese, as advocated by a great many people.

And suppose the products of the Orient should be permitted ingress into our country free of duty, where would the California grower find himself?

Suppose all these things should be done as advocated by a great many distinguished men in public addresses and debates, what would the harvest be in a business sense?

We are ready to admit that changes ought to be made in the schedules of the Dingley law as it relates to certain commodities, which we do not produce in abundance but which are necessary to the possible comfort of our people. But the sweeping demands of our untutored tariff tinkerers go too far and their contention, if carried into law, would create a condition of industrial paralysis all along the line. Just stop and think:

Would everything continue to prosper as at present? Would labor continue to be fully employed, at an ever-increasing scale of wages, as at the present time? Would there be tremendous purchases of raw materials to be manufactured into products? Would farmers enjoy increased prices for produce? Would wool advance or decline? Would the rolling mills continue to run night and day, or would orders that have already been placed, be canceled, so far as possible? Would California, with abundant crops, continue to enjoy the prosperity she is now enjoying?

Business men who have memories ought to know what effect sweeping tariff revisions, let alone tariff agitation have upon business. Some of them may have forgotten, but it stands to reason that no man who was engaged in business in 1895 has forgotten.

These questions are far above politics. The answer to them would effect business, the resources and home lives of our people. If the president should recommend general tariff revision, as endorsed by some of these wild conceptionists of tariff modulation on everything scheduled in the Dingley law, it wouldn't be six months before thousands upon thousands of our working men and scores of our factories would be out of employment.

The tariff reformers go too far in demanding the virtual abdication of the whole tariff system of the country.

* * *

Profits In Sugar Beets.—The value of the beet sugar industry to farmers is well illustrated in the case of a county in Idaho where a farmer bought a tract of land for $3,500. In a year thereafter a beet sugar factory was located within four miles of the farm purchased. "Much of the land on this farm was in alfalfa," says the Desert Farmer, "and the young man who purchased it preferred to keep it in alfalfa than to put it in sugar beets because so much more easily handled and at some less expense."

It seems, however, the owners of the farm were induced later to put part of their land in sugar beets and the first year the yield so far surpassed in profits what the owners had before received that they were amazed at the result.

They started by planting fifty-four acres in beets, contracting the labor to Japs, except the team work.

Now the Desert Farmer gives the output of the crop and the net amount it realized the owners. It says:

"The beets have just been harvested and yielded an average of 16 tons per acre, for which $3,888 in cash was paid the farmers. From this had to be deducted about $1,188 paid the Japs, leaving the farmers $2,700 for their labor. It is scarcely necessary to say that under these circumstances the farm for which they paid $3,500 could be readily sold for over $10,000."

This is only one instance where the beet sugar proposition has made individual farmers a handsome revenue. Around Grand Island, Nebraska, the farmers have been putting their land into sugar beets for several years, with the result that their farms have paid them from 25 to 33 per cent. greater profit than they did when sown to grain or planted to corn.

These are pointers which farmers located in districts approximate to sugar factories, may study carefully and act on accordingly.

* * *

Useful Information About Raisins—George Robertson has writen a very interesting article in the Fresno Republican which he styles "Some New Raisin Figures." In this article he treats of the present foreign demand for raisins, as compared with the demand in the past seven years, and shows that with one exception, the export trade has grown annually and that raisins are being used as an article of diet more generally today than at any time in the past.

"Some two months ago," says Mr. Robertson, "a report circulated in the press and by others that the reason for the stagnation in the rasin market and falling off in the demand for California raisins, was owing to the large importation of Spanish raisins. This may have been done to create a scare among raisin growers by interested parties, but to those who know anything about imports and exports it was absurd. The latest returns just received from Washington prove how false the statement was, as up to November 1st the imports of foreign raisins was only 2,065,851 more than the corresponding period of last year, an amount too small to have much influence on a crop of the magnitude of the California output. The amount so far imported is actually 2,052,057 less than the total imports for last year. The imports have varied but little during the last three years, averaging only a little over six and a half million pounds a year, against which we export California raisins to the extent of three or four millions, which reduces the proportion of foreign raisins imported to an unimportant factor in the situation. The year 1884 was the record year for foreign raisins, no less than 56,676,000 pounds being imported, but in that year the California crop only amounted to 3500 pounds. In the last ten years the imports have fallen off rapidly, almost in proportion as the California crop increased, and in the last few years the imports of foreign raisins have been in a great measure counterbalanced by the California raisins exported.

The value of the raisins imported last year was $236,080, the value of the currants $757,966; and the value of California raisins exported was $147,760.

The British colonies are our best customers for California raisins. Last year Canada took 2,613,637 pounds and British Australasia 761,141 pounds, or a total of 3,374,778 of the 4,020,418 exported. Mexico comes third on the list with 350,646 pounds.

* * *

The value of raisins as an article of diet, is mentioned by the writer of the article as becoming more generally acknowledged, especially in the treatment of tuberculosis. He cites the instance of Dr. Josiah Oldfield, who is not only a licentiate of the Royal College of Physicians and member of the Royal College of Surgeons, London, a D. C. L. of Oxford University, and a barrister-at-law of Lincoln's Inn, besides being the author of several medical works, stated in an interview in August last that vegetable and fruit juices were of the greatest value in the treatment of consumption, in its earlier stages. He says:

"I put raisins as the first of all foods that I know of. They are far superior to grapes, because the sugar has been thoroughly matured and ripened, and transformed ready for digestion." . . . "In addition to raisins, another valuable food is raisin syrup, not so-called raisin wine, but what is called in India 'Draksherash,' which is an Indian non-alcoholic wine made of raisins and a few spices."

The above extract should prove useful to cooks generally, and to housewives who desire to have healthy children.

Raisins have long been used, not only as food, but in olden times as a substitute for candy by the younger generation. The boys of Christ's Hospital, in London, a large and ancient public school, receive a packet of raisins annually, the funds for which were left by one Peter Symonds in his will, dated 1586.

And it might be added here that the hospitals in Chicago, New York and Philadelphia are using raisins more freely today than at any previous period. The demand for raisins is increasing.

* * *

Frost Protection—The orange growers of Florida have devised a simple protection for their fruit which appears to do the work at very little expense. It is known as "an emergency cloth green house" being in effect a green house heated artificially during only the few nights that frost and freezes visit Florida. All of the rest of the time the fruits and vegetables have every natural advantage afforded by Florida's usually mild climate, as the cloth covers are all brailed back and the skeleton framework does not interfere in the least with perfect ventilation and all of the sun, air, rain and dew that naturally fall upon an out-of-door crop are secured. In this particular the device is superior to glass greenhouses.

These emergency cloth greenhouses are so devised and constructed that they can be operated (closed or opened) at the rate of one acre per hour by two men. The cloth is so prepared by chemical treatment that its life extends over a period of from eight to ten years. The Chicago Packer sent a representative to Orlando Florida, to report on the device and he reports that he saw grape fruit, tangerines, pineapples, bananas, strawberries, string beans, cauliflower and lettuce, all flourishing under this system and some of the most delicate vegetables being started at a time when it would be folly to attempt them out of doors.

It might be well for California orange growers and vegetable raisers to look into this device, for although we have, very seldom, any use for it, there might be a necessity some time when it would repay its use many times.

Tender garden stuff especially could be protected.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The Kings County Agricultural Association held a meeting the first of the year and set the first week in October as the time for holding the next fair.

The Enterprise says, the orange growers of Riverside made a literal wall of fire around their orchards during the late cold nights and thus saved their crops.

About 1900 rooted vines and cuttings, shipped from Fresno by Dr. G. A. Hare, have been stopped at Cutler by the horticultural commissioners, on account of the phylloxera scare.

Dispatches to the Riverside Press from every orange growing section south of Tehachapi, gives the orange output this year at 22,970 car loads. Lemons 3770 cars. Very good for an off year.

Ellwood Cooper of Santa Barbara has offered to rid the state of Massachusetts of the gypsy and the browntail moth pests for $25,000. That is reasonable enough if Massachusets has the real thing.

A number of packing houses of Redlands have decided to close down for a while in order to avoid competition with the frostbitten fruit which is being shipped out from other localities in large quantities.

Orange thieves in Colton have been vigorously pursued ever since the Colton Fruit Exchange has offered $2 reward for each person caught in the act of stealing oranges from the groves of members of the Exchange.

The Santa Fe railroad officials have had a man out, who visited every orange and lemon growing district in Southern California, and returns with the report that very little, if any, damage may be looked for from the recent frost.—Ontario Record.

Butte County citrus growers are making the claim that their trees stand more cold weather than those in Southern California, and instance the last cold wave as proof of the assertion. No damage to speak of was felt when the temperature got down to 26 degrees.

The apple growers and peach growers of this county are to have instruction on the 18th and 20th of this month from Prof. W. L. Clark, the specialist on diseases of these trees. On the 18th he will be at Toluca where he will advise on the peach worm, and on the 20th he will meet with the apple growers at Los Angeles. He is an authority on the pests which infest these trees.

A vegetable grower at Gardenville, this state, claims to have propagated a new variety of watermelon, which can be kept through the fall and winter in the same manner in which potatoes, onions etc. are preserved. He claims the melons are luscious during midwinter as in the summer. He claims to have a cellar full now that are very fine, but it sounds like a "pipe dream" and it is not likely that the winter markets will soon be over stocked with watermelons.

The Chicago Packer accounts for the poor sale of California peaches last year on the ground of their being picked and shipped green. It says: "During the past season California Salway peaches were shipped greener even than usual, and often while they were selling in eastern auction markets for hardly more than freight and refrigeration, Colorado and other eastern peaches were bringing over $1 a box; and we all know that a California Salway, left upon the tree until hard ripe, is an excellent peach to eat. Could they have been delivered in that condition in eastern markets, the results would have been satisfactory.

AGRICULTURE.

The Oxnard Sugar Company expect to put 18,000 acres in beets this year.

Thirty-one sacks of canteloupe seeds, amounting to over one and one-half tons were in Colton one day last week enroute from Rocky Ford; Colorado, to Brawley.—Colton News.

The Watsonville Register is boasting of a Pajaro pumpkin that weighs 225 pounds. Its greatest circumference is 101 inches, and it will make 1000 pies.

The Spreckles Sugar Company has made a liberal proposition to the landowners around Salinas, offering to construct and maintain a pumping plant to furnish water for irrigation if one thousand acres be pledged for ten years to be put in sugar beets.

The amount of sugar manufactured is over 25,000 tons as the beets showed a high percentage of saccharine material. During the season's run 530 men were employed at the factory, and 150 will be needed to clean up the machinery and put it in trim for the next season's campaign.

The Spreckles Beet Sugar Factory, near Salinas, made the following record during 1905: Began slicing beets, Sept. 20; Finished slicing Dec. 9; tons of beets sliced, 170,000, of which the various localities produced as follows.

Salinas valley, 126,000 tons; Pajaro valley, 23,500 tons; Santa Clara valley, 14,000 tons; San Juan valley, 6,500 tons.

The American Beet Sugar Company at Oxnard has been receiving large quantities of beet seed the last few days from Germany, and more is coming. The company figures on receiving 3600 bags of seed approximating 110 pounds to the bag, to use around Oxnard and to be sent to Chino. This makes over 300,000 pounds of beet seed to be sown about those two communities.

The Coachella Valley Producers' Association shipped 187 carloads of melons last summer from Coachella, says the Chino Champion. These melons were grown on 690 acres, of which 529 were at Coachella, 107 at Durbrow and 54 at Mecca. These shipments brought gross receipts of $191,258.59, or net to the growers $101,8295.50. The gross value of the watermelons shipped by the association amounted to $8833.17 and of grapes, $2450.85 gross, making the amount sold by the association $202,550. Out side of the association there was sold about $20,000 worth, making in all over $220,000 sold from Coachella alone.

LIVE STOCK.

Mills Bros., of Hanford shipped 4,000 head of fat cattle to San Francisco last week.

San Jacinto's new creamery has been finished. It is owned by Dr. Groeff and W. M. Carlin of Los Angeles.

Fred. Hansen of Escondido is one of the most successful poultrymen in the state. He now has 2000 fine birds in his yards.

Eureka, it seems is to have a creamery that will be about as big as any in the state. It will be big enough to turn out about 20,000 pounds of butter a day.

An epidemic of glanders has caused an official killing of $50,000 worth of horses in Vancouver in two months. About one-third of all horses in the city have been shot and cremated.

The Porterville Enterprise states that a number of horses have died in that city lately, and their deaths are said to have been caused by eating hay that became "rusted" last season.

The America-Mexican Cattle Company has been organized in Los Angeles recently with a capitalization of $250,000, to handle a large cattle business in Antelope Valley, in California, Arizona and Sonora.

The immense sand bar which had formed at the mouth of the Russian river and which prevented salmon getting into that stream has been blown open with dynamite. Great quantities of salmon are now running into the river.

The Los Angeles Creamery Board of Trade for the ensuing year will be composed of A. C. Smithers, C. H. Sessions, J. E. Platt, R. R. Briggs, F. J. Peacock, P. Rabb, H. Michel, R. W. Davis, T. Crawford, W. P. Hage, San Diego, an O. J. Weber. Among those who attended were H. A. Bingham, J. Bartlet, H. Burr, J. O. Sullivan, H. Davis, J. W. Chase and J. Wilson.

Exulting over the progress Northern California is making in industrial development, the Alameda Encinal says: "There are many dairy centers in the Middle States that turn out from 20,000 to 30,000 pounds of butter a day, and there is no reason why this new enterprise at Eureka should not be the forerunner of others on an equally large scale. What with beet sugar factories and creameries Northern California is rapidly making good its deficiencies."

The total production of butter in California in 1905 was 41,961,047 pounds. With but few exceptions, there was an increase in the output in every county. The increase over the production for the previous year was 17 per cent., placing California in the front as a dairy state. The remarkable growth in butter output shows a gain in five years of 211 per cent, the greatest gain being made in the counties located in the San Joaquin and the Sacramento Valleys, their remarkable progress being the best proof of their adaptability in the way of profitable dairying.

MISCELLANEOUS.

San Francisco is to have 75-cent gas.

The next State Teachers' Convention will be held at Fresno.

The beautiful little town of Dinuba has been incorporated as a city of the sixth class.

The San Francisco gas and lighting works have been sold to the Standard Oil syndicate.

Conductor Neff will announce the dates for several institutes in Southern California in a few days.

The next meeting of the National Educational Association will be held at San Francisco July 9 to 13, 1906.

Merchants and other business men of Salinas say that this year's after holiday trade is the best they have ever had.

The News says: The Carnegie library site is the all-important subject that is now agitating the minds of Fullertonians.

Congressman Knowland has introduced a bill raising the head tax on aliens coming into the United States from $2 to $25.

The Hanford Sentinel reports the fact that Kings county is out of debt having paid on January 3, the last obligation owing by the county.

There is more snow in the mountains of Kern County than ever before known at this season. The result will be plenty of water later.

Many of the property owners of Watsonville have at last decided to remove their front fences. This is the result of civic improvement agitation.

Automobile and team routes have been established between Tulare and the fields of colonization work at Corcoran and in the Angiola country. They are doing a large business.

Citizens of Claremont, Uplands, San Dimas and Lordsburg have appointed committees to work up interest in the proposed extension of the Pacific Electric from Monrovia through to Uplands.

The Santa Paula Chronicle reports Ex-Senator Thomas R. Bard, who was seriously injured a little over two weeks ago by being thrown from his carriage, as slowly but surely recovering.

Workmen excavating for the Southern Pacific grade in the vicinity of Watsonville have discovered quite a stock of petrified "remains" of animals, resembling the mastodon of pre-historic days.

The Directors of the Pomona American National Bank voted to give $50 to the Fruit and Flower Mission and the same amount to the Women's Relief Corps, both of which organizations are assisting materially in caring for the poor people of the city.

Fuel oil from the oil wells of California and Texas is replacing coal upon the railroads of California, Arizona, New Mexico, Texas and Mexico to such a great extent that coal operators in New Mexico and other coal fields of the West are becoming alarmed.

Senator J. E. McComas has presented the Pomona Public Library with one of the most interesting and valuable documents from a historical standpoint possessed in this city. It is an abstract of title to lot 2, block 45 or the San Jose rancho upon which the city of Pomona now stands.

In its determination to enforce the compulsory education law the San Bernardino City Board of Education has empowered the president of the board to appoint an attendance officer whose only duty will be to investigate causes of absence, and to arrest truants between the ages of 8 and 14 years.

President Diggs of the Sacramento Valley Development Association has been advised by Secretary W. A. Beard, that the Federal Agricultural Department is willing to send four expert persons to California for a period of ten weeks to labor for the extermination of the pear blight in the valley. The cost will be about $1200.

Last week was the coldest weather ever known in Southern California, the mercury registered as low as 23 degrees. The orange crop was badly injured and it is feared many of the trees were killed, as 26 degrees is as low as they are supposed to stand. Many palm trees and other plants that were many years old were killed and flowers and vegetable gardens that were never frostbiten before were entirely destroyed.—Ukiah Times. Oh what a whopper! There was frost all right, but no such damage as reported by the Times.

SILAGE.

W. S. Fraser, in a late bulletin of the Illinois Experimental Station, discusses the advantages and value of silage, the crops best grown for the porpose, the time and method of harvesting them, and the essentials of silo filling. Records of the cost of filling the silo, kept by the station on 19 different farms in various parts of the State, show a range of from 40 to 76 cents per ton, the average being 56 cents.

OUR CITRUS CROP.

The 1904-05 crop of citrus fruits in California broke all previous records, the shipments for the year ending October 31, 1905, being estimated at 31,422 carloads, or 11,105,864 boxes, as against 29,399 carloads, or 10,701,210 boxes, for the same period in 1903-4. Of the total given for 1904-5, 26,044 cars were oranges and 5,378 lemons.

The bulk of the crop is furnished by Southern California, the shipments from that section being 29,592 cars for the past season, but northern and central California show a steadily increasing output.

LINERS

WALNUT TREES FOR SALE.—I HAVE 8000 2-year Santa Barbara Soft Shells which I will dispose of at the very lowest price. A. J. HIXSON, Burbank. Cal.

FOR SALE—TWO THOROUGHBRED Scotch Collies, sable and white markings, 1 and 2 years old, and a pup 8 months old. Price $10 each. These dogs are among the best bred on the Coast. HUGH CONWAY, Saticoy. Cal.

FROST PREVENTION—FOR SALE AT half price, 400 Froude Patent Oil Fire Pots in good condition, used only once, part of them not at all. No further use for them. Also Electric Alarm Thermometer and fixtures. C. H. LOCKWOOD, Burbank, Cal.

C. H. SESSIONS, ASSOCIATE EDITOR

BETTER RAISE THE COWS.

It is not good practice to buy cows as they are frequently short milkers, have not been educated to give milk ten months in the year. It requires a good deal of time to get them accustomed to new surroundings and conditions and they not infrequently possess undesirable qualities, are kickers, unruly, vicious, etc. There is also danger of bringing tuberculosis and other diseases onto the farm. It is expensive and unsatisfactory for usually something is the matter with the cows offered for sale.

It is better to raise a herd than to attempt to buy one. One has the advantage of knowing about their ancestry and whether they are good performers or otherwise. There is the chance to raise calves from cows that are well bred and good producers. Seldom will any man sell good cows. The buyer has to take the culls or pay a price which places good cows beyond his reach. Much valuable time is lost in buying and selling many cows in the endeavor to get a few good ones. Breed from the best cows only, test them and find out just what they are doing. Raise the heifer calves from the best cows and when old enough, breed them to the best pure-bred dairy sire you can get. Test the heifers from this cross when they come in milk and breed them in turn to a sire strong in dairy blood. In this way any man can have a herd in a few years that will be a credit and that will make money for him.—Wis. Agriculturist.

HORSES IN DEMAND.

F. C. Hanson of Portland, Oregon, who made a trip through the western country in quest of draft horses, gives his opinion that the scarcity of farm horses is greater today than at any time in years. He urges farmers to engage in horse raising as a profitable business.

The demand for draft horse and for mules is very keen, he says, and the government in the Philippine Islands and the miners in Alaska will also draw heavily on the market.

"The desirable stock on the coast has been practically cleaned out," continued Mr. Hanson, "and buyers in the Pacific Coast cities and for government contracts must look to Montana and even as far East as the Dakotas for their supplies."

"The days of the cheap horse in the Northwest are over. I remember a few years ago when great bands of horses roamed the plains of eastern Washington and were considered not worth feeding. Thousands died in winter on the range. This condition has disappeared, owing to the demand for good horses in Alaska and the Philippines, to say nothing of the requirements for heavy trucking, delivery, etc., in the big cities.

"On the Coast we would get more of the Montana and Dakota stock but for the fact that in Chicago and Kansas City the demand is very heavy, and big teams are now selling for double the money they brought a few years ago. In Illinois, Kansas and Nebraska the farmers who raise high-grade Percheron and other draft types get $500 and $600 per span, four years of age, as quick as they are brought to market. The big concerns grab them up rapidly. The same is true of mules of the heavier type, which sell like hot cakes in the cities of the middle West.

"As long as this condition prevails, the stockmen who raise horses in the Pacific Northwest will demand higher prices. Alaska's need will be greater every year, and the government is in the market regularly for horses for the Philippines."

COWS SHOULD BE BETTER BRED.

Judge Shields of Sacramento has this to say about better breeding of dairy cows. It is exactly in line with the views expressed by the Cultivator time and time again.

Dairymen should be educated to bring up a better grade of cows. There should be better blood, which would result in better milk being produced. What is needed is education in the dairy business. Dairying in California is extremely crude; in fact, the cows are unproductive in milk and butter. The remedy for this is the introduction of better blood in the dairy cattle. California is behind any other State in number of thoroughbred dairy cattle. Referring to the chances for agricultural education at the State University, Judge Shields says the equipment at that institution is not what it should be on account of the failure of the legislature to make sufficient appropriations. It will be necessary to inaugurate a campaign having for its object the securing of sufficient money by legislative enactment for educational work in the State University in connection with the dairy industry.

GOAT MEAT FOR SALE.

G. C. Babo of Colfax, Cal., in American Stockman: I am in the goat business and like to read the experiences of the goat men. I have grade goats from seven-eighths to short hair. I have been in the goat business two and one-half years and have at the present time 1,200 head. I shear twice a year on account of brush and accidents with my goats getting caught in barbed wire and on account of keeping them healthy and free from lice.

I dip once a year, after shearing, as I think there is nothing comes nearer to cruelty to animals than to allow goats to get lousy, and would advise every man in the goat business to dip—regardless of cost and inconvenience. When I had only a few I used a barrel filled one-half full of dip. I took a small rope, made a slip noose on one end, that I put around the goat's hind feet and put him in the barrel. I used a common sugar barrel, and since I dipped the first time and saw the benefits I have thought if I only had one goat I would dip it. I have so far found sale for all my kids by killing and peddling.

When I first started to kill I went to the butchers and tried to sell to them. They said the people were prejudiced against goats and would not eat them.

So I commenced to kill and peddle—and in our town and surrounding neighborhood I have had as high as forty orders at one killing. I sell at 10 cents a pound, give hind quarter one week and front quarter the next to my customers, and there is no complaint. Kill every Saturday, and if I forget a customer he is as mad as a hornet.

Every man that is in the goat business should do all he can to introduce the meat, and as soon as people try it they call it the best of any domesticated animal there is. It is certainly entitled to the name "Angora venison." We tan some of the skins, and they certainly do make the finest rugs there are in the United States. It seems a question with some men in regard to goats living on brush alone. Now, I am on a range where there is practically no grass, and my goats are the fattest I ever saw. Most of them have their kidneys entirely covered, and a great many of my customers claim they are too fat.

There is no question about them being fond of weeds, for they are great lovers of weeds and brush.

PROBABLY FEVER THE CAUSE,

J. F. S., Santa Rosa, wants to know why his cow does not come in heat again since calf was dropped in September. There are several causes which produce this condition. The one of the most general is fever in the womb producing unnatural conditions. The cow should be fed regularly, kept from chilling at night, and in all probability the matter will correct itself. The hens you write about probably need meat once a week.

CONFINEMENT OF DAIRY CATTLE.

The last few years the policy of closely confining daiy cows during the winter, and even during the entire year, has grown in favor; upon the ledger and "milk check" this demonstration has found its proof. To the unwary and to the intensely practical dairyman these very tangible evidences are proofs enough; but to the far-sighted breeder the practice presents objections that seem to have a deeper importance than the casual observer may take notice of. The practical man in any line may work on with marked success though he be regardless and even ignorant of the deeply working fundamental principles that govern his occupation; yet his ignorance does not excuse him from facing abnormal conditions that offended nature may sooner or later impose upon his business as a result of his shortsightedness.

Impoverished farms in all parts of our country are certain results of rash methods with nature. Soil that has been building for thousands of years cannot endure the depleting extravagance and unreasonable culture of the present and the past. Neither can the constitutional vitality of man and animals stand radically unnatural conditions without consequent degredation. One after another our great prisons are being condemned as veritable snares of human life; this because man is constituted to breathe nature's pure air, not the contaminated vapors of absolute confinement.

The cow question, then, is whether dairy cattle may be subjected to entirely artificial conditions indefinitely and still preserve a health that is above suspicion. Not a few readers will recall the humid and vitiated atmosphere that they have encountered on opening the doors of a well-filled cow stable on a winter morning. To the closely confined cow this is often the constant condition.

The recent prevalence of bovine tuberculosis is attributed by many to close confinement. All the well-defined cases of this disease that have come under the observation of the best veterinarians have been traced to lack of proper ventilation of the stables where the cows are confined.

The best official herd test of Holstein-Friesian cows made in Ohio for several years was of six cows that spent the entire day in a barnyard and were stabled only at night. This test was conducted during the coldest weather of February, but the cows went out every day. The owner of these cows is a strong believer in his practice, and although his barns are in a large city, he never shuts the cows in except nights and bad weather.

It should be kept prominently in mind that the fresh-air cow is the vigorous cow, and the one that can transmit to her calf a constitution fit to carry with success and to perpetuate those estimable qualities and characteristics that the zealous enthusiast sometimes seeks to stamp in his herd where health and vigor of body are neglected.

GEO. P. WILLIAMS.

THE CATTLE WAR IN WYOMING.

The current number of the Outing Magazine contains a very interesting article from Arthur Chapman, in which he reviews the war among cattlemen which has been going on with more or less violence since 1892. The war has ben known as the "rustlers' war," and while it has raged many men and hundreds of cattle have been killed. The impression has been widespread that the fight has been between the honest owners of cattle on one side and an organized community of cattle thieves or "rustlers" on the other. But never was anything more misnamed, declares Mr. Chapman. To be sure there were cattle "rustlers" in Wyoming, and there is no doubt that they had become exceptionally bold. But it is doubtful if there has ever been a more lawless business than tl old-time cattle business since the world began. When the great cattle trails were opened some cattle owners started with a small herd at one end of the trail and arrived at the other with thousands of strange beeves that had been "picked up" on the way. Some of these men became cattle kings, and built grand houses, in which they were always uncomfortable, and even went to the legislature or to Congress. Beside them the rustler, who stole a few paltry head of cattle, must always remain a rather pitiable figure.

Considering the Wyoming cattle war from an unprejudiced viewpoint, it appears that the rustlers merely figured as an excuse. The main object of the cattle owners who invaded northern Wyoming with a half hundred professional man-killers seems to have been to drive out the small ranchers. Some of the men who had taken up homesteads in the heart of the cattle country were to be killed, and life was to be made so miserable for the others that they would take down their fences and decamp, and the threatened disintegration of the cattle herds would be postponed indefinitely. Had this plan been successfully carried out in Johnson county, no doubt it would have been made effective in other parts of the West where the settler was getting too strong a foothold. The cowboy would have been living his picturesque life on the open range today, but the growth of the agricultural West would have been set back a generation.

CARE OF CREAM.

Prof. E. H. Farrington in bulletin No. 129, of the Wisconsin Experiment Station under the caption "Some Creamery Problems," gives the following pertinent and timely rules for the care of cream on the farm. We commend these rules to dairy farmers that are using hand separators. The proper observance of them would greatly improve the quality of the products as well as the price of the same.

Place the separator on a firm foundation in a clean, well-ventilated room where it is free from all offensive odors.

Thoroughly clean the separator after each skimming; the bowl should be taken apart and washed, together with all the tinware, every time the separator is used; if allowed to stand for even one hour without cleaning there is danger of contaminating the next lot.

Never mix warm water and cold cream or sweet and slightly tainted.

Provide a covered and clean water tank for holding cream cans, and change water frequently in tank so that temperature does not rise above 60 degree F. A satisfactory arrangement may be made by allowing running water to flow through cream tank to stock watering tank.

Skim immediately after each milking, as it is more work to save the milk and separate once a day, and less satisfactory, than skimming while milk is warm, since the milk must be heated if kept to another milking.

Cream testing 35 per cent. fat or more is the most satisfactory to both farmer and factory. The best separators will skim a rich cream as efficiently as a thin one, and more skim milk is left on the farm when rich cream is sold.

Cream should be perfectly sweet, containing no lumps or clots when sampled and delivered to buyers.

There is a good demand for sweet cream, and it can easily be supplied by keeping the separator, tinware, strainer-cloth and water tank clean and the cream cold.

These recommendations, if followed, will pay well for what some may think is "a lot of extra bother."

PURE-BRED STOCK.

After having called attention to the relative number of pure-bred live stock to scrubs and grades in England and Canada, the St. Paul Farmer states that we have a much smaller per cent of pure-bred live stock to grades in the United States than is found in England, but that even in England where they have been improving the live stock for generations there is still a very large per cent of scrubs. In view of this fact, with reference to an overproduction of pure-breds in this country, the Farmer says: "Consequently long years will transpire before the proportion of pure-breds will be in excess of the needs of the country." The Farmer infers that since England has been improving her live stock for years and since there is still a large per cent of scrubs in that country, it will be many years before there will be an overproduction at home.

In a measure we agree with this proposition, yet we can see no reason why the statement should be made that it will be many years "before the proportion of pure-breds will be in excess of the needs of the country." We do not think the proportion of pure-breds will ever be in excess of the needs of the country. The more pure-bred cattle, horses, swine or sheep we have the better it will be. It is probably too much to hope that scrub will some day be done away with entirely, but such a condition would certainly be desirable. It is to be hoped that by the time the farmers in the United States have been breeding pure-bred live stock as long as the farmers in England have that our proportion of scrub and grade stock will be much smaller than it is in England at the present day.

It is stated that the proportion of pure-bred live stock in Canada to scrubs is larger than in the United States. There is one pure-bred horse to each 162 scrubs and grades; one pure-bred head of cattle to each 60 scrubs and grades, and in the case of sheep there is one to 30 and of swine one to 60. These figures show that Canada has a larger per cent of pure-breds to scrubs and grades than has the United States. In 1900 the Department of Agriculture estimated that the number of pure-bred cattle in the United States was about one per cent. It is to be hoped that when the next census is made we may be able to make a better showing.

Poodlv—"I'm going to marry a nice girl and settle down."

Boorly—"Why not marry a rich girl and settle up?"—Judge.

A GOOD STOCK FOOD.

Mr. Lidell from The Palms brings to our office, for identification, plants of the White Melilot or Sweet Clover (Melilotus alba), an escape of European origin.

Mr. Lidell states this plant grows in strongly alkaline soil and that his stock eat it with avidity. He wishes to procure seed from it for further planting, and says Los Angeles seedmen do not handle it. Who can aid him?

The Missouri Agriculture College, with a load of three-year-old Hereford steers won third prize in the Pittsburg Live Stock Show in competition with other feeders from all parts of the United States. The Missouri bunch was admitted to be the best of the heavy cattle shown, and had the judges not preferred younger steers would have undoubtedly won the first prize. They sold for $7.10 per hundred weight, bringing a little more than $100 each.

A Three Tent Poultry Show

The Poultry Breeecers Society of Southern California and Los Angeles County Association Combine in Making a Fine Exhibit.

The response of the public in attending the Los Angeles poultry show this week is gratifying to those who have turned in and worked hard against obstacles. No room large enough was to be had, so three large tents were erected at the corner of Sixth and Hill streets, and these have given abundant room, the best of light and the best of close-in locations.

Secretary W. M: Humphreys and Superintendent Dillingham, with other members of the Society, have put in a vast amount of hard work, to start in with the bare ground and put up such a creditable show. The coops are well arranged, the various breeds being placed together, and the room is such that one-tier coops prevail. The poultry supply men are given a prominent place down through the center and make a good showing.

All told, there are about 1800 birds exhibited. About 450 of these are pigeons, and another hundred, perhaps, capons, pheasants, pea fowl, song birds, freaks, etc. Amongst the freaks is a four-legged duck, a "crowing hen or a laying rooster, which?" This last freak is a Barred Rock, with big, rooster-like head and comb, and body and plumage of the hen. It is asserted that "she" will both crow and lay.

Amongst the song birds are canaries, finches, "white-headed nuns," orioles and others. The pheasants are from Mrs. Hubbard's ranch at San Fernando, and are beauties. Mrs. Hubbard wins the banner as the largest exhibitor, with 83 birds.

The White Wyandottes win first place as to number of any one breed. White Rocks second, followed by Barred Rocks, Langshans, Orpingtons, Rhode Island Reds, Brown Leghorns and Andalusians. The most surprising feature is the scarcity of White Leghorns. The favorite Whites nearly all took to the woods and left the field to the other breeds.

The biggest tent is filled with utility breeds and the displays of the supply houses. The next tent with pigeons, fancies, games, bantams, novelties, song birds, pheasants, etc., and the last of the three tents with turkeys, geese and ducks.

The attendance from the first day has been really surprising, and proves that Southern California takes pleasure in fine stock.

* * *

The two little baby ostriches attract much attention and have their appetite with them for anything which may be offered.

The great number of brooder chicks and the little fellows just kicking off the shell in the incubators, draw the crowds.

The Henry Albers Company has a most attractive exhibit and the chicks in front of the distorting mirrors add spice to it. The Los Angeles Incubator is showing its worth by bringing out a good hatch. Of course Mr. Albers has a fine exhibit of foods and poultry appliances.

The A. C. W. (Agricultural Chemical Works) people have a fine exhibit of poultry foods. These foods have become favorites with many poultrymen and are today meeting exceeding-large sales.

Mr. McClanahan is on hand with "Old Trusty," showing the goods and giving out his big 120-page catalogue. By the way, this establishment has moved its permanent quarters from 819 S. Main to No. 711, or one block nearer the center of town.

The "Silkies" may be all right for the fancier, and Japs may like the flesh but one who has tried to eat it said "give me crow for mine." Only two of these peculiar Japanese birds are exhibited, but they attract attention..

"The hottest White Wyandotte contest ever," is what the "Dotte" exhibitors are up against. It is certainly a fine exhibit of that breed.

The Petaluma Incubator, with its ducks and ostriches just hatched to show its possibilities, attracts a crowd. Duck eggs are a test of an incubator. The Petaluma stands the test. The Midland foods are exhibited, but the Midland people say "our best exhibit is in the egg basket of the poultryman who uses these profitable foods."

Dean's Pacific Incubator occupies its little corner with a few machines, and Mr. Dean is on hand showing its merits. The Pacific is winning new friends every day.

The effort was made to have every ribbon in place before the doors opened, but of course some were still unplaced at the end of the opening day. The judges worked like nailers, however, and at this writing we have heard no complaint from work of judges.

Chamberlain's goods occupy a prominent place in the Germain exhibit. Chamberlain calls them the "Perfect Foods,". and one poultryman said, "well, I've tried them, and by jingo, I want to tell you they come mighty close to being true to name."

The Jubilee Incubator is in the same exhibit, and the big factory at Sunnyvale has sent down some fine looking machines.

The special cups are beauties, and not yet awarded as we go to press.

C. B. Williams exhibits an ingenious trap nest on a new line. It has two compartments, the second for the hen after laying the egg. The Klonginger Bros. have full exhibit of the Cypher's incubators and foods. Mrs. Williams exhibits the Sure Hatch Incubator. The Queen Incubator has several machines on exhibition. "Kill Roup" has its corner.

Chas. Winsel exhibits poultry foods and the California Incubator, one of the newest incubators in the market.

There are a few less pigeons than last year, but Mr. Foster, who has them in charge, says that their value will excel that of last year by at least a thousand dollars.

LAKENVELDERS.

As may be noticed in another column, the state now has a few of the Lakenvelders, which have attracted some attention in the East, and in articles in the Cultivator. Mr. Sheppard, of Arcata, is the progressive poultryman who has introduced the breed. His local paper, speaking of this breed, says:

A characteristic that is instantly noticeable in this breed is their grace and sprightliness of movement. They are as restless as pheasants and are wonderful foragers and like their cousins, the Leghorns and Hamburghs, good flyers.

For persons having unlimited range, as upon farms and country homes, the Lakenvelders possess advantages not found in any other fowl. They require only about one-half the feed of any other variety. This is owing to their wonderful foraging abilities.

S. C. Rhode Island Reds

Six years continuous and exclusive breeding of Reds. First on cock at L. A. Show, '06. Eggs, per 15, $2.00. MRS. E, L, COWAN, R. F. D. 1, Santa Ana.

Brown and White Leghorns

Prize winners at L. A. Show, '06. Eggs from good laying strains. Eggs, special matings, per 15, $2.00. Incubator lots, $6.00 per 100.

MIDLAND

IF YOU WANT EGGS YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

MRS. A. BASLEY, ASSOCIATE EDITOR, HOLLYWOOD, CAL.

BIDDY ON THE BROODER.

This is the week of the big poultry show, and I want to urge all my readers who can possibly come in to Los Angeles, to visit this exhibition, not to miss the opportunity of not only studying the beautiful fowls, of which there are almost every variety, but also of seeing the incubators, brooders, coops, feeding vessels; the various foods, grits, etc., and all the appliances needful for the successful prosecution of the business of keeping and rearing fowls.

* * *

I have frequently written urging our readers to keep trap-nests in order to test the laying qualities of the hens. I have had two trap-nests made at my own expense for this show. These may be seen at Mr. Alber's exhibits. His representative has kindly consented to explain them to those who wish to have him do so. These trap-nests were invented by a government expert at the Maine experiment station; they are not patented, any one may make them. I consider them the easiest made and most satisfactory of any. I have twice given the plans and description of them in the Cultivator and now our readers who are going to the show can have the opportunity of examining them for themselves. There are many other interesting and new appliances there, but I must leave a description of them to others, whilst we return to Biddy and our chickens.

As I have said many times, Biddy must have been well dusted with insect powder; Lambert's death to lice is what I generally use. Stroke Biddy gently, she will ruffle her feathers to show her displeasure and a good handful of powder can be peppered or sprinkled under the feathers. This should be done once or twice every week during incubation, then when the chicks are hatched I put a tiny bit of fresh lard on the top of the head and under the chin of each baby chick. In this way they are always free from lice.

I feed them with chick feed that the brooder chicks have, in fact I treat them in exactly the same way, keeping them and their mother in a "cat proof" coop or small run, with a coop or box for her to hover them in at night. In wet weather she and her babies should be under shelter in a shed. When the weather is fine the "cat proof" coop should be out on the grass and be moved frequently on to a fresh, clean place. Clean water and skim milk should be kept before them, the drinking vessels being scalded every day.

I read recently an article by Mr. Parks, one of the advocates of the dry feed method. It so aptly describes the usual way of treating Biddy and chicks that I will reproduce it here.

"The usual methods when the old lady brings off her family, are to shut her off in a coop and bring on all the wet mash she and the chicks ought to eat for a full day's time, dump it down on a board in front of the coop. Some of this is eaten, most of it forms a doormat for the youngsters, and in one-half hour's time looks much like the dirt surrounding the coop. Lying in the hot sun it does not take long to start rapid fermentation and we soon have germs of bowel trouble growing at the rate of forty miles an hour.

Books say that chicks should be fed five times a day, and the nervous owner thinks that if five is good, six is better, and soon comes round with another dose of the same feed, puts it on top of the first "charge" and we have a sandwich of wet dough and dirt. In a few days' time the chicks begin to start for the world where mashes are unknown, and the owner says "darn the chicken business," or else he blames the man from whom he purchased the eggs for having "inbred stock," and we have another case of the "business don't pay." Perhaps his painstaking neighbor improves on this method and bakes the mash, which is quite an improvement, as it removes a part of the water, but at the same time is quite a little labor. His chicks do better, making a phenomenal growth for a few weeks, and he thinks that the solution of the poultry man's trials lies in cooking the food. He invests in an amateur bakery and bakes everything. His chicks continue to thrive, apparently, but as the hot weather comes on he notices some bowel trouble among the half-grown birds. These die and he shouts that cholera has struck him, writes to the editor of a poultry paper, who tells him that the symptoms look like cholera. After changing the feed and

Poultry and Eggs Wanted

In nearly every town in the State you will see this sign outside of a merchant's store and it will certainly convince you that there is money in producing poultry either for market or eggs. During the number of seasons the CHATHAM INCUBATORS AND BROODERS have been sold on the Coast they have been the means of assisting hundreds to make money out of their poultry and eggs— and the Chatham has given such a good account of itself that I have decided to sell it this year on our—On Time—terms, all freight charges paid. Write me for descriptive catalogue.

Geo. W. Foott, 325 East Morrison Street., PORTLAND, OREGON

losing half his flock, he gets around to hard grain, and pulls them through, or what is left of them, although they are not now as large as the chicks raised under the natural method without the assistance of the bake shop."

Mr. Parks' picture is graphic and really not exaggerated. The method which I have used for years, and which I have described in these pages many times, is to use the dry chick feed. Mr. Parks also keeps before the chicks always a dish of beef scraps, and plenty of green food, besides the small grains. They take the food slowly and naturally. Their digestive organs are not over-taxed, the liver not over-worked and enlarged, and they have every chance of growing up strong, sturdy, vigorous fellows, with the best of constitutions. It was proved at one of the government experiment stations that the cooking of the food, if the chicks were fed only cooked food, was positively injurious, the chicks died from it. The cooking of food, some think, makes it more digestible. Which part of the food is rendered more digestible? The starchy part may be more easily assimilated, but the protein is not. The simple scalding of a mash makes no chemical change. It might as well be mixed with cold water as with hot, the chemists tell us. Then why not feed it dry?

I hope our readers will all read my reply to Mrs. H. A. F. on "poison or what?" It may help many.

* * *

EDITOR'S QUESTION BOX.

Poison or What?—(H. A. F., Pomona, Cal.) About four years ago I saw a sample of the California Cultivator and I fell in love with some of your writings on poultry, and I subscribed for the paper and have taken it ever since. I am more than delighted with your writings on poultry and I have got three to take the paper on account of the poultry department. I have been keeping about two hundred chickens for about five years and have had no serious trouble and done well with them until recently. Have had quite a bit of trouble; they seem to have bowel trouble. Some seventy-five young pullets, about three months, had it first. They were Brown Leghorns and Minorcas, mixed, and in a few weeks I found some yearling and two-year-old hens had it. They seemed to have it worse than the young ones and dropped off a good deal in their egg yield. Quite a lot of gravel passes in the droppings and they pick it out and eat it with a relish. I have been feeding the same as usual, rolled barley one morning and oats the next. On Sunday a mash of bran to the old hens, with one-third cornmeal to the young ones; ten pounds of fresh meat and bone ground fine is mixed with the feed, also one teaspoonful of mustard and ginger and cayenne, and a teacup full of charcoal well mixed with the soft food once a week in cool weather. The night feed is wheat twice a week, Egyptian corn three times and common cracked corn twice a week, then skip one week, etc. Clean the coops every day, no mites and don't think they have lice. I paint the perches with Lee's lice killer. Will you please give me your advice what the trouble is and what to do for them. How long would you advise giving Bluestone? It seemed to help them. The most of them look fine with bright red combs. I feed them sour milk and keep grit before them all the time. Would you advise setting their eggs?

Answer.—The trouble is either poison or worms. The fowls are getting something that disagrees with them. The difficulty is to discover what it is that is disagreeing with them. I think it may be in the fresh meat; the butchers put some preservative on the meat which makes fowls sick. I had to give up feeding my little chicks Hamburg steak on this account. I now use "beef scraps" from Armour or Swift, or one of the large packing houses. Putrid meat will have the same effect, either is more or less poisonous.

Another thing which is also poisonous is mildew or mould from the grain or food getting wet. There was a big fire some years ago at a mill in Los Angeles. A great deal of wheat was spoiled and many people bought the wet wheat to feed their fowls. Hundreds died and their owners thought it was chemicals used to extinguish the fire. It was nothing but the water on the wheat, which made it mouldy. Be sure that your barley, oats, corn, etc, is not mouldy.

Now as to the treatment, instead of the blue stone, I would put some bicarbonate of soda into the water, about a teaspoonful in a quart of water. Keep this up for a week.

If you think it is worms, put a teaspoonful of turpentine into a quart of water and give them no other water to drink. Keep this up for a week. Or if one or two of them seem more ill than the others, give them a teaspoonful of castor oil and a teaspoonful of turpentine mixed; this will usually bring away the worms. For a week I would advise you to give the flock mixed in the mash, onions chopped fine. Onions are a very good tonic, will cure a cold, and often will kill worms. You are feeding for Leghorns and Minorcas all right, except perhaps not enough green feed. I would not advise your setting the eggs of any hens that show any symptoms of sickness.

WHITE WYANDOTTES.

Editor Cultivator: Will you kindly tell me about the relative value of the Wyandotte as a general purpose fowl? I am a new beginner in California poultry raising and would like your idea of the Wyandotte.—W. W. C., Anaheim.

The above question was sent to a Wyandotte fancier who, makes the following answer:

To many breeders of other varieties the popularity of the White Wyandotte has been a cause of wonder and envy. They seek to explain it by saying that it is simply the result of a boom and that this popularity will wane just as quickly as it came. I think every White Wyandotte breeder will join with me in a protest against any such theory. An analysis of this popularity will, however, not be out of

TO WHOM IT MAY CONCERN:
As the chicken raising season is at hand, we beg leave to call your attention to a few of our specialties: Do you need an Incubator? Our machines are fully guaranteed and have proven themselves unsurpassed wherever used. Do you need Brooders? We manufacture just what you want; fully guaranteed, made of the finest material and of the best possible workmanship, and, above all, a practical machine which saves the purchaser money, time and labor. Do you need Poultry Supplies of any kind? We manufacture a line of Supplies the use of which makes Poultry Raising not only profitable, but a pleasure. Among our specialties are: Our Water Fountains, our Self Feeder for Chicks; our Feed Troughs, large and small; our Lamp Fillers; our convenient Must Hatch Nest Boxes; our safe and sure Must Hatch Insecticide, our sanitary Must Hatch Disinfectant; our sure death Must Hatch Lice Exterminator; our Poultry Compound, a fine Spring and Fall Tonic.
In connection with the above list, all of our own manufacture, we can also furnish the following, which are indispensible to the Poultrymen: The No. 128 Clover Cutter, the Enterprise Bone Mill, the Ohio Feed Cutter, the Banner Root Cutter, the Enterprise Feed Chopper, the Ideal Duplex Feed Mill, and the Farmer's Boiler. Do you wish to make your own Incubator or Brooder? We can furnish you all the necessary parts for making an Incubator or Brooder, also plans for the best and most practical Poultry Houses. Did you ever purchase Just Hatched Chicks? We have a Hatchery of 50,000 chicks per month capacity, in operation the year round and have, for the past few years, been successfully shipping, in our specially constructed carriers, just hatched Chicks, to distances as great as 2,000 miles. If you need them book your order early, as our future delivery list is rapidly filling up. We can also supply White Leghorn hatching eggs in quantities desired. If you have not already received our catalogue, write for Catalogue B, and you will find therein a more detailed description with prices, etc., of the above.
Hoping to hear from you in the near future, we are, yours very respectfully,

place. I shall explain it by simply stating the reasons that led me some years ago to give up all other varieties for the White Wyandotte. First of all, I decided that in this practical age the utility or general purpose fowl was the one to breed. I found this in the Plymouth Rock and Wyandotte, but after many years' experience, I found that the Wyandotte excelled the Rock as a layer. So it was a case of Wyandotte, and my choice was naturally the white variety, as being in my eyes one of the most beautiful of domestic fowls. They attract every one, from the amateur to the veteran poultryman. Even people who know absolutely nothing about fowls are struck with admiration when they see a flock of them with their snow-white plumage, bright yellow legs and rose combs; who could help admiring them? Therefore it seems to me their popularity lies in their beauty and their usefulness. Taken together, what stronger combination could be devised? In all poultry shows it is the White Wyandottes that attract the most attention. Even the breeders of other varieties never fail to size up this class and pick the profitable winners.

When I commenced breeding White Wyandottes I had in mind a double object, namely, the production of a heavy laying, prize-winning strain. Many advised me that this was impossible and backed up their assertion by the highest authorities that the ideal Wyandotte shape does not conform to the ideal egg-laying type of body. They claimed that the long-bodied hen would be a better layer than the one with a short body. However, this has not been my experience, because most of my record layers have been typical shaped birds, with that short body and back so admired by fanciers. To my great satisfaction, therefore, I have found that the prize winner and the heavy layer may combine in the same bird. One of the heaviest layers I ever owned has produced several winners at the large shows. By keeping the utility qualities of the White Wyandotte well to the front they need never lose the premier position they now occupy.

CHICKEN TALK.

Cool mornings feed warm mash.

Breed from your very best birds.

Scald the drinking vessels often.

Too fat hens will lay soft-shelled eggs.

Over-feeding is as bad as under-feeding.

Perches are easily cleaned when made moveable.

Don't keep chicks too long on one piece of ground.

The hens lay more eggs when separated from the cock.

Force the hens to scratch if they don't do it naturally.

Use hot whitewash on the houses in preference to cold.

Unless a chicken is valuable don't waste time doctoring it.

When feeding green food to poultry see that it is minced fine.

Pure water is one of the most important items in chicken culture.

For best results clean the chicken coops and houses once a day.

Give the fowls fresh water at least three times a day; once is not enough.

It is best that the chickens should always have one person attending them.

If you wish to avoid roup keep the chickens from drafts.

As soon as your cockerels begin to develop combs put them in coops by themselves.

Put a little lime water in the drinking water once in a while to avoid bowel complaint.

Keep the pullets that grow the fastest and strongest; they will be your best winter layers.

Be sure the new chickens you buy are free from disease before you put them with your flock.

Buy a few fowls now when you can get them cheaper than in the spring, and begin that poultry plant.

Do not take chicks away from their mother when just hatched, as they need the warmth of her body.

A wash of chlorate of potash in vinegar is good for canker sores in the throat and mouth of chickens.

If there is an unpleasant odor emanating from your chicken house the house is neither clean or healthful.

It is advisable to dig out the dirt in the henhouse two inches in depth occasionally and fill in with clean, fresh earth.

THE RURAL TELEPHONE.

Among the added improvements on the farm of late years, is the rural telephone. Indeed it has become a necessity to most farmers, and especially so if they are doing a business which requires them to keep in touch with the markets of the city.

It has become almost not only a financial matter but in the matter of saving time it has proven an extremely valuable adjunct to the farm.

If a physician is needed for the family, the rural telephone will bring him, saving the time of someone who would have to take a horse and go for him, perhaps taking the horse out of a team and from much needed work.

If a horse or cow gets sick, the veterinarian may be called and save the animal. So with many other things about the farm. The time will come when every well managed farm will have the rural telephone.

"Did I understand you to say that all rum selling had been stopped in your town?"

"Not at all. I merely said it was strictly prohibited." — Philadelphia Press.

"I hear Bumps has given $1,000 to the conscience fund."

"Can't be true."

"Why not?"

"Bumps never had $1,000 worth of conscience."—Detroit Free Press.

General Agricultural Notes

CALIFORNIA CROPS.

The Crop Reporter, published at Washington by authority of the Secretary of Agriculture, gives the following statistics of California crops for 1905:

Corn.—Acreage 56,592; yield 32 bushels per acre; total, 1,810,944 bushels; average price, 76 cents; farm value, $1,376,317.

Wheat.—Acreage, 1,886,238; yield, 9.3, total crop, 17,542,013 bushels; average price, 82 cents; farm value, $14,384,451.

Oats.—Acreage, 168,755; yield, 28 bushels; total, 4,725,140 bushels; price, 51 cents; farm value, $2,409,821.

Barley.—Acreage, 1,237,533; yield, 21.5; total, 26,606,960; price, 59; farm value, $15,698,106.

Rye.—Acreage, 67,402; yield, 13; total, 876,226; price, 77 cents; farm value, $674,694.

Potatoes.—Acreage, 50,291; yield, 165 bushels; total, 8,298,015; price per bushel, 67 cents; farm value, $5,559,670.

Hay.—Acreage, 589,119; yield per acre, 2.40 tons; total production, 1,413,886; value per ton, $10.05; total farm value, $14,209,554.

EUROPEAN SUGAR OUTPUT.

The harvesting of beets being ended, Gieseker has issued his estimate of the probable production of raw sugar in Europe for the season 1905-6, which, as published in the Bulletin des Halles, is 6,855,000 tons, an excess of about 2,150,000 tons over the production of 1904-5.

CLIMATE AND CROP REPORT

United States Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for he week ending Monday, January 10, 1906.

General Summary.—Clear and cold weather prevailed throughout the State, with dry northerly winds. Fogs were frequent in the coast districts and severe frosts occurred nearly every night in the interior. Slightly warmer weather prevailed at the close of the week.

The seasonal rainfall is far below average except in portions of Southern California, and the soil in most sections is too dry and hard for profitable cultivation. Farming operations are generally at a standstill, although some plowing and seeding are being done. Early sown grain is in poor condition and making slow growth. The grain acreage in the central and northern sections is less than usual at this date and present indications are that it will fall below average for the season. Grass made a fair start during December, but in many places it has been killed by the severe frosts and its growth greatly retarded in all sections. Feed is scarce and cattle are suffering. Reports have been received of quite serious losses of livestock, owing to scarcity of feed and unusually cold weather. Conditions are somewhat better in Southern California, but rain and warm weather are needed in all sections.

Timely warnings of frosts and customary precautionary measures averted serious damage to oranges in Southern California, but young growth on trees and tender vegetation suffered considerably. Orange harvest is progressing rapidly in the south. The oranges are said to be generally of smaller size than usual, but the yield is good.

Eureka Summary. — Cold, rainy weather has been very severe on stock. Feed is short, and on some ranges cattle are subsisting almost on acorns. Owing to the dry summer and cold weather, grass did not get a good start and has but little substance in it.

Los Angeles Summary.—Cold and frost continued until Saturday, when weather became threatening and showers fell in San Gabriel valley at night. Drought continues. Rain is needed badly; irrigation general.

ERADICATING JOHNSON GRASS

From experiments already carried on by the U. S. Government, it seems feasible to eradicate Johnson grass in a single year by plowing in the autumn, care being taken to turn the soil completely. After plowing the land should be harrowed immediately, so as to get it smooth and well pulverized, after which it is given treatment by root diggers, which tear out and collect the roots. In the spring the land should be plowed again and put in some cultivated crop, in rows, of course, giving it ordinary good tillage. All plants of Johnson grass that remain should be pulled out by hand, and by repeating this whenever the grass gets about 6 inches high it can be eradicated in a single summer without an excessive amount of labor. These directions apply to cultivated fields and are not practicable along fence rows, ditch banks, etc.

"FERTILIZERS A·C·W· "FOR·THE·LANDS·SAKE"
TRADE MARK

STOP !

And think how many Orange and Lemon Groves are "loafing," barely producing enough fruit to pay for the care. A man would not hire a laborer at $2 per day and let him go to sleep in the shadow of a tree—not much—why should he hire Orange and Lemon Trees to work for him and let them "loaf?" Is it the trees' fault? NO. Treat them well, feed them the food they demand, and they will work and pay a profit even in "poor years." In every district there are a few orchards that produce more fruit than others. WHY? The trees are fed. We can quote you some crops that are "eye openers." Write our agents in all citrus districts or to us direct how these crops are produced.

Queries and Suggestions

WALNUTS.

Editor Cultivator: I have English walnuts on my ranch, which is a sandy loam soil; should the trees be pruned? If so, when? Some of the limbs are very low, almost to the ground. I pruned some of the trees a month or six weeks ago, and now after each cold morning the water drips in quantities from where the large limbs were sawn off. Will this not injure the trees? If so, what shall I do?—L. G. W. Tropico.

The time to prune is now. The bleeding of which you speak is very common. We know of no way of stopping it and have never noticed any injury therefrom, although it certainly does not benefit the trees.

PEACH PITS.

Editor Cultivator: Please tell me where I can get 200 pounds of peach pits and also give the address of some cannery in the south.—J. M. H., Pine, Cal.

Southern California Canning Co., Macy street, Los Angeles; or G. H. Waters & Co., Pomona.

ACACIAS WANTED.

Mrs. M. M. Child of Santa Barbara wishes to know where she may obtain the following Acacias, who has them? Centis, diffusa, homalophylla, obliqua, macradenia, saligna.

JAPANESE PERSIMMONS.

Editor Cultivator: Are Japanese persimmons propagated from seed or cuttings? Where can I get the seed?—Subscriber, Newcastle.

Very satisfactory persimmons are obtained from seeds, but if you wish the best, get the grafted sorts. We know of no seed supply, but presume the larger seed houses and nurseries could either supply you or inform you who could.

BEETS AND PEANUTS.

Editor Cultivator: Kindly answer these questions through your paper: Will sugar beets grow in a clayey soil? How should they be planted? What kind of soil does it require for peanuts to grow in? How should they be planted? How much seed of beets and peanuts does it require to the acre, also the cost per acre of each.—I. N., Hanford.

Sugar beets will not succeed on clay soil. For cultural directions, etc., send to the University at Berkeley for Circular 13, (March, 1905) "The Culture of the Sugar Beet;" to comply with your request in a way to benefit you fully would require too much space.

In regard to peanuts, we quote from Prof. Wickson: "The quality of the land should be a rich, sandy loam that is known as upland. Damp land gives the nuts a straw color and the quality of the nut is not so good as those raised on upland. They should not be irrigated except on land that will not bake and then they are liable to be discolored. The best time to plant is from the first to the middle of May, acording to the location, the object being to get the seed in after the ground warms up well. Very early planting makes an uneven grade of nuts, the first to form become ripe too soon for the main crops and the stems get soft, so that they will not lift the nuts from the ground at harvest time. It takes about thirty pounds of the California, or White Virginia, and fifty pounds of the Tennessee Red to plant an acre. The usual distance to plant is in rows three or four feet apart, with the hills sixteen to twenty inches apart in the rows. The Tennessee may be planted a little closer. The California peanut is the best to plant, as it yields from three to four times as much as the Tennessee Reds and finds more ready sale. Peanuts should be cultivated about the same as corn, not allowing the weeds to grow among them, keeping the ground loose and mellow, and when the spikes begin to form, they should not be disturbed. If they are, it causes nuts to blight or not fill out. The blooms do not require covering."

The cost of growing and harvesting has been estimated by one of the best Orange county growers to be about $30 per acre.

GARDEN SOIL.

Editor Cultivator: Will you kindly advise me through your valuable columns if sandy loam soil taken from 5 to 6 feet below surface of ground is good for flower beds if mixed with well-rotted stable manure, or is top soil better.—H. D. L., Sunnyvale.

Virgin soil, if of good physical texture is better than the worn out surface soil. Of course it lacks humus, which will soon be supplied by the stable manure you contemplate using. It may also be deficient in nitrogen and if the plants show it you must stimulate them by using a little nitrate of soda and later add some more permanent food.

The California Pomelo

(Continued from Page 31)

this fruit came in immediate competition with Florida. In another case the gentleman thought it wise to contend with his principal (in the East) that my fruit was equal to Florida's. The gentleman was very resistant on his point. At his instance a box of Nectar from my grove and a box of seedless from another grove were sent to him for his critical judgment. Receiving a reply the agent wrote me "Mr. ———and I had some spirited correspondence regarding grapefruit as the result of several criticisms he had made about the California fruit. After stating that he sent him the samples of both my fruit and the seedless, he adds:"and after a long dissertation on the Nectar I asked him to give an opinion after trying both kinds of fruit. He now comes back at me with the statement that 'the Nectar improves with acquaintance.'"

I have endeavored to show in this article that California can and does raise the Pomelo, improperly called grapefruit, superior, or at least compares favorably with Florida fruit, and that that is fit only for home consumption. It is just as cheap to raise the right kind and it is equally delicious—hence in the interest of California's reputation, as well as in the interest of individual grower, all these unmarketable varieties should be rebuded to produce fruit of the type of the Nectar or seedless. Having had six or eight distinct types on my ranch I have reduced them to two desirable kinds.

Let it be distinctly unlerstood I do not claim any superiority for the Nectar over several others of the same type. I know of four or five names that cover other fruit of just the same type and of equal merit and I endeavored to have them so classed at the meeting of 1901, but the owners of the other names declined.—A. P. Griffith.

HAD CEASED TO CARE.

Voices of hate make discords in God's air—
But we have ceased to care!
Dark clouds have shadowed all the blue skies fair—
But we have ceased to care!
Within our hearts we live a life supreme—
We overhear the footsteps of a dream,
And life as sweet as faith's own heaven doth seem—
And we have ceased to care!
—Atlanta Constitution.

A Husband in Fifteen Minutes

Jake Stout jogged along the dusty country road on his old gray mare. The sun was hot and he frequently mopped his face with a great red handkerchief.

A little bundle tied up in another gorgeous bandanna hung across the pommel of his saddle. He wore cowhide boots, and his coat, minus buttons, was held together by a cord which approached dangerously near the dimensions of a rope.

His strange dress was a matter of choice, for his saddlebags were well filled with greenbacks, for which he expected to get manv a bargain in the shape of fat, sleek heifers and well-fed shoats.

His reputation always preceded him. He was known as a queer but kindly old fellow, shrewd in business matters, but utterly unsophisticated in all things else. Many a laugh was had at his expense in his absence, but he generally commanded grim respect at close range.

Although outwardly stolid, Jake was secretly pleased with the deference shown him, never suspecting that it was a tribute to his money rather than his personality. As the servility of those he dealt with increased proportionately with his wealth he began to swell with pride and importance; then had come the awakening. He had gone down into the river counties to buy stock, and, true to the instincts of a cattle buyer, hungered for the latest market reports.

One day while rounding up some cattle along the river bank he saw a boat in the middle of the stream. He hailed, beckoning it to approach, and it soon came alongside and ran out its plank.

"Come aboard," yelled the impatient captain. He had stopped as was the custom in those pioneer days, to take on passengers at several out-of-the-way places and was a full day behind on his run.

Jake stood immovable.

"Come aboard, I say,' repeated the captain, accenting the invitation with an oath.

"I don't want to come aboard," replied the stolid Jake, his feet firmly planted where he stood.

"What in the thunder do you want, then," roared the enraged captain.

"I want to know what fat's worth in St. Louis," was the calm reply, whereupon the captain's entire vocabulary of choice oaths and imprecations was hurled at the enterprising cattle buyer.

As the little boat, puffing and panting, backed off, Jake shouted:

"All right; it's your turn now; but jist let me ketch you and your ole boat up at Snaghook an' I'll give you blazes."

As Snaghook was several miles inland, this was greeted with a loud guffaw from the deck hands and the captain alike.

It was all lost upon Jake, however, who in righteous indignation stalked toward his horse, mentally consigning the unobliging captain to parts unknown, and still wondering about the price of "fat"

Another time he bought up all the cattle for miles around and started to drive them to St. Louis.

The news spread ahead of him, and as Jake's drovers neared town, the market, which had been high, suddenly and mysteriously dropped.

There was much secret exultation, for the prosperous man has enemies in country districts as well as on Wall Street; but Jake also had friends, and the news of the market reached him. He immediately stopped, stationed buyers on every road entering the town, and bought every animal traveling cityward. Very soon the market was stronger than it had been for years. Then he unloaded, reaping a fortune, much to the chagrin of those who had planned his ruin.

* * *

On this summer day, however, as he toiled up one clay hill and down another, no such trifles disturbed him. He had weightier matters to consider.

His sister, who had been his housekeeper for many years, had left him. His big house was lonely, and he must fill her place. How could he do it? He ransacked his brain for plans, but could hit upon none that was satisfactory.

Suddenly an idea struck him. He pulled his horse up short, and his blue eyes twinkled as he exclaimed: "By jacks, I have it! I'll get married." Then, the problem solved, he rode on. But here was fresh trouble. Whom could he marry? Numerous spinsters and widows had looked longingly at the big house on the hill, surrounded by its hundreds of broad acres; but their charms had failed to impress its owner.

"Never mind, he soliloquized. I'll find some one; but she must be smart and spry."

He lapsed into silence, soon to break out again: "Women are funny critters, though, and some of 'em deceive you; if I could only test her aforehand now;"

His test would be to demonstrate her ability as a cook, for Jake attended hurriedly but well to the wants of the "inner man." But to cook well was not enough. In his eyes it was a besetting sin to be slow in preparing a meal. Any woman who had this defect could never hope to rule over the heart and moneybags of Jake Stout.

With a quick jerk he again brought his horse to a standstill. He seemed puzzled. Surely he had forgotten something—but what?

He examined his bundle. It was secure. He even dismounted and inspected his saddlebags, but could find nothing wrong.

Suddenly he realized what was lacking. It was his dinner! Here it was nearing three o'clock and he had not tasted a morsel since four in the morning.

About a mile distance he saw a small house and in a short time had reached it—the home evidently of poor farmers; but the dooryard was neat and well kept, and smoke was coming out of the chimney. This augured well for something to eat, so he dismounted and tied his horse.

An old man on the porch watched him curiously as he came up the gravel path. They were off the main road and visitors were few. He had been dreading for some days one man—could this be him? Tears came in the old man's eyes as he arose, trembling, to greet the stranger.

"Howdy," said Jake. "Could I git a bite of dinner and some feed for my horse?"

"I dunno," was the reply in a dazed kind of way. "The old woman is sick and Samanthy is puttin' out the washin." Then raising his quavering old voice he called, "Samanthy, Samanthy, come 'ere."

A woman who had reached that uncertain age when she is no longer young, yet considers it an insult to be called old, soon appeared. She was not prepossessing, being tall, thin and angular. Her face was freckled and her eyes were small and close together. Her hair was thin, wiry, and of that particular sandy color which seems to match the face and give an appearance of baldness. Neat, thrifty and energetic she certainly was, and her parents as well as many neighbors could have attested to her goodness of heart; but these were virtues invisible, and the rural youths of the neighborhood, in their search for wives, had passed by her. Years before she had accumulated the necessary dishes, linen and bedding to begin housekeeping, but never having the opportunity to use them, she had resignedly laid them away with her heart- hungry hopes—and devoted herself to her aged parents.

As the years passed her tone became a little sharper and her face more set and stern. Her voice was unpleasantly shrill as she replied, "Well, father, what is it you want me to do?"

"Here is a man wants his dinner. Kin you get it right away, while his horse is feedin'?"

"Yes, if he can do without meat. We have none unless I kill a chicken."

Jake moved uneasily in his seat. His mouth watered for chicken, but habit had made him a miser in regard to time spent at meals, so he said, "No, I don't want it unless you kin git it quick. Jist give me a snatch of anything handy."

The two men started to feed the horse and Samanthy returned to the kitchen. In fifteen minutes she called Jake to his dinner. This did not surprise him, but when he saw chicken fried crisp and brown he gasped and held up his hands in astonishment.

"You didn't kill and cook that chicken in fifteen minutes?"

"Yes," was the blunt reply.

"Are you married?" he asked.

"No,' came in a sharper tone.

"Would you like to git married?" he continued.

Samanthy's small eyes for once grew large, but keenly alive to the main chance, she stammered out, "Yes."

"Well, then," said Jake, "ef you kin git ready as quick as you cooked this chicken you kin git on the horse behind me and we'll go over to Plankville and have the justice tie the knot."

"But," said the excited Samantha, "I couldn't leave father and mother. They have no one in the world to take of 'em but me."

"Never mind that," was the cheerful reply. "We'll take care of the ole folks. I allers liked ole people, anyhow."

As she started to leave the room he said:

"You ain't very purty, but I never went much on looks, nohow. I've been lookin' for a smart, peart woman, an' you seem to fill the bill; so git ready while I eat a bite."

Samantha needed no second bidding and soon mounted behind her future "lord and master," feeling considerably elated that she had distanced all other woman by winning a husband in fifteen minutes; she had yet to learn the value of her prize.—Marion Wallace.

THE DEARTH OF MEN.

From nearly every side comes the plaint of maids and matrons that desirable men are scarce. Ned Greenway's affair was perhaps the most conspicuous exhibit of the dearth of beaux, and there have been others. The forlorn fair ones say that too many men prefer the supper-room and the sipping of wine to the more gallant activities of the entertainments they attend. Worse yet, they do not attend at all, in as goodly number as might be. In conseouence, there has been not a little searching in the highways and byways for more male material. Young men have been shanghaied for some of the smartest events who would not have been thought of a few years ago. Indeed, some of the new found gallants, quite worthy and respectable youths, no doubt, whose names appear on the assembly and cotillion lists are all but impossible. The man-famine is such that almost any young would-be swell who can wear a dress suit without consciousness, not severely mangle the English language, and avoid down-right boorishness, may hope for the entree almost anywhere, save in a few, modest, exclusive affairs usually held in private houses.—San Francisco Argonaut.

BE ON THE SAFE SIDE.

There is no brain so brilliant that alcohol cannot master. There is no body so strong that it is impossible for poison to effect it. There is no will so powerful that it can say to a bad habit, "Thus far and no farther." The only safe course is to keep from forming habits that degrade, to let poison alone, to refuse to give alcohol the chance to cloud and confuse the brain Why not be on the safe side?

Cookery Recipes

Sponge Cake.

Three eggs, 1½ cups flour, 1½ cups sugar, 2 teaspoons baking powder, 2 teaspoons vanilla, ½ cup boiling water. Beat the whites and yolks separately until light, then put together and beat again, sift in sugar a little at a time, add flavoring, flour and baking powder, beat altogether, last stir in hot water; bake in two layers and ice.

* * *

Blackberry Cake.

Six eggs beaten separately, 2 cups sugar, 1 cup butter, 4 cups flour, 2 cups blackberry jam, 1 cup buttermilk, 2 small teaspoons soda in milk, 4 teaspoons alspice, 4 teaspoons of cinnamon, 1 grated nutmeg, 2 teaspoons of cloves; put the 2 cups of jam in the last thing.

* * *

Boston Cream Candy

Three cups white sugar, 1 cup syrup, 1 cup cream; boil until it forms a soft ball when dropped in cold water. Just before taking from stove stir in 1 cup chopped nuts; stir until cool; spread on buttered plates and cut in squares.

* * *

Oyster Patties.

One quart of cream, 1 quart of drained fresh oysters, wash and cut each in two; let cream come to a boil, season with salt, pepper and butter size of egg; thicken it like cream. Fill patties and serve hot.

* * *

Potato Cake.

One cup butter, 2 cups sugar, 2 cups flour, 1 cup mashed potatoes, ½ cup milk, 4 eggs beaten separately, ½ cup grated chocolate, 1 cup English Walnuts, 1 tablespoon cinnamon, 1 tablespoon cloves, 2 tablespoons baking powder, ½ tablespoon nutmeg, 1 teaspoon vanilla. This is a delicious cake.

USES OF COAL OIL.

A few drops on your dusting cloth will brighten your furniture, as well as prevent dust flying from the cloth.

One tablespoonful added to each boilerful of water will lessen labor as well as whiten your clothes when washing.

A few drops added to your boiled starch will make ironing easier.

A few drops on a hinge or roller which has formed a bad habit of squeaking will insure a speedy cure.

A few drops added to the water with which windows are to be washed will save time and labor.

Dip the fingers in the oil and rub he throat to give relief from sore hroat.

Saturate a cloth in the oil and rub he rollers to clean a clothes wringer quickly.

Saturate a cloth with the oil to clean the sink, bathtub or basin which has become greasy and discolored rom use.—Woman's Home Companion.

OILED AND PAINTED FLOORS.

If you have never had your kitchen floor painted, do not allow another summer to pass without doing it. A woman can do the work. Paints of any color may be bought already mixed, and are so inexpensive, while the amount of labor saved is so great that we often wonder why there should be a kitchen floor in the land that is not painted.

Scrub the floor clean and let it dry, then give it two coats of paint, [illegible]ing [illegible] coat plenty of time to dry. A little Japan dryer added to the paint will hasten the drying, which is important when one needs to use the room all the time. It is usually better to do the painting in the evening after the supper dishes are washed and leave the doors and windows open. If not quite dry in the morning, and you cannot cook the breakfast in some other room, lay boards across where you walk the most to keep it from being tracked. If you prefer an oiled floor to a painted one, get a gallon of linseed oil and heat a quart of it until almost boiling, and apply it with an old paint brush, which should be clean, of course. Two coats are usually needed.

The care of an oiled or painted floor is important if you would keep it in the best condition. Mop the floor once a week, using a suds of good soap; rinse it with clear water and wipe dry. It is never necessary to use a scrub brush, and the water should not be hot.—Painter.

THE SECRETS OF LONG LIFE.

We have not a doubt but that our earnest, true-hearted girls wish to live long lives, but we wonder if they realize that now is the time for laying the foundations to such a life. Here is something that may set them thinking:

You sometimes see a woman whose old age is as exquisite as was the perfect bloom of her youth. You wonder how this has come about. You wonder how it is her life has been a long and happy one. Here are some of the reasons:

She knew how to forget disagreeable things.

She kept her nerves well in hand, and inflicted them on no one.

She mastered the art of saying pleasant things.

She did not expect too much from her friends.

She made whatever work came to her congenial.

She retained her illusions, and did not believe all the world wicked and unkind.

She relieved the miserable, and sympathized with the sorrowful.

She never forgot that kind words and a smile cost nothing, but are priceless treasures to the discouraged.

She did unto others as she would be done by, and now that old age has come to her, and there is a halo of white hair about her head, she is loved and considered. This is the secret of a long life and a happy one. —Girl's Companion.

THE COON AND THE TIGER.

A small dark coon was walking one day in the desert for the sake of his appetite when he ran full tilt into a large and comparatively healthy tiger. The coon realized, instinctively, that he would require to exert all his wits to keep things going on as satisfactorily as usual. And so he spoke up in a perfectly candid way.

"Good morning," he said to the tiger, who did not answer but looked at him roguishly.

"The desert air is fine this morning," continued the coon, and the tiger smiled in a good humored manner.

"But I derive no benefit from this fine air," continued the coon, "for I am ill. Yes, I have taken poison!" he went on, with a feverish look in his deep, brown eyes. "Last night I ate a pailful of strong arsenic which I mistook for whitewash. My physician tells me that I am so saturated with poison that if anything only touches me nothing could postpone immediate death. If, you, for instance, touched me with your teeth only, it would kill you instantly. Nothing could postpone death."

"Why wish to postpone death," said the tiger, cheerfully. "I may tell you that I consider this meeting sheer good luck, for I am tired of life and came out to commit suicide. Kindly stand still, so, while I spring. A little further to the left, please, Thank you!"—Punch.

THE COUNTRY WEEKLY A POWER.

A writer in the Review of Reviews sums up the qualities of the country weekly paper as follows: "Each copy is not only read by the people credited to the ordinary paper but twice or thrice that number. In many instances subscribers pass their papers on to less fortunate homes. These publications are pre-eminently the home papers of newspaperdom. They are not superficially scanned while men travel to business and left to brakemen to gather up. They go directly into homes and the reading of them is a duty as well as a pleasure. Hence their peculiar value as moulders of public opinion and as advertising mediums."

THE FOXY ONE.

Mrs. Knewbryde was in tears.

"You have forgotten already," she sobbed. "You d—d—don't care for me any m—more! You——"

"But what have I forgotten, dearest? Tell me!"

"This is my b—birthdav, and you haven't brought me any present, or said a w—word about it, and——"

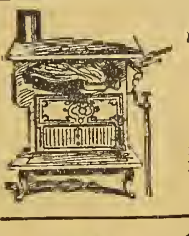
"Nonsense, darling, I remembered it perfectly, but I didn't want to remind you that you were a year older."

And peace and happiness reigned again.—Cleveland Leader.

DO NOT FRET.

I've learned as days have passed me
  Fretting never lifts the load,
And that worry, much or little,
  Never smooths an irksome road.

For you know that somehow, always,
  Doors are open, ways are made,
When we work and live in patience
  Under all the crosses laid.--Selected.



BURN AIR AND SAVE FUEL

You can do it with the

HAGUE IMPROVED DOMESTIC OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for the least money, write for information to

Hague Domestic Oil Burner Co., 810 So. Spring St., Los Angeles, Cal.

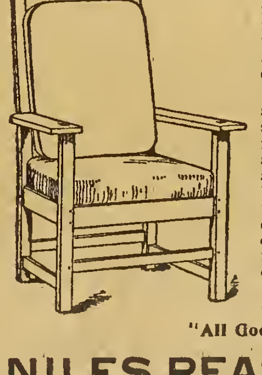
"Dependable Furniture at a Fair Price."

The Best Old Mission Furnitue



In the designing of the best true Old Mission furniture, all attempts at artistic and fancy decorations must give away to plain, simple lines. This furniture is designed for strength and durability, and on account of its simplicity it is artistic and most desirable.

Gustav Stickley, the famous craftsman, is the designer and manufacturer of the finest line of Mission furniture on the market. All of the pieces from his shops are true to the Old Mission styles and are made entirely by hand by the most skilled artisans. We are sole agents here for this superior line and now have the finest showing of Mission furniture in the city. We have this furniture in the dark mahogany and in the light and dark weathered oak. All of the oak pieces are put through the fuming process and are given the genuine fumed oak finish.

We invite you to inspect our showing of this furniture.

Los Angeles Markets.

Los Angeles, Jan. 11, 1906.

Vegetables have again advanced under the influence of the continued dry weather and keen demand, and quotations on some varieties have doubled during the week.

Eggs are easier and a further decline is expected.

Butter is firm as quoted, and with hay advancing and no pasture, a further rise is quite possible.

Oranges are moving slolwy at bottom quotations on the local market. Deciduous fruits are in nominal supply.

AMERICAN WIRE FENCE.

There are many kinds of wire fence, but the requisites are first that it shall be strong to hold up against and withstand all extreme strains, and then flexibility, to take all ordinary shocks, give and come back to its original shape, so as to not stay sagged or bent.

These two very important qualities are found in the superlative degree in fence made by the American Steel & Wire Co. Their fences are not only constructed from extra long fibre steel wire, strong and flexible, but this is galvanized heavily to protect it from the weather and prevent rusting out.

This concern operates thirty big plants and all make very known kind of wire, from the stiffest, required in piano manufacture, to the finest—almost silky—fibre which is woven into wire cloth. With such extensive facilities, and opportunity to observe their products under all sorts of conditions, it is not surprising that they should be able to produce wire surpassing in quality all other kinds.

And the enormous quantity they make enables them to reduce the cost to a point where they can sell the very best wire at prices very much lower than other concerns have to ask.

Steel is the very best material for fences because it is the strongest substance made. Its invention and development have made possible modern skyscraper buildings, bridges of hitherto impossible length and height, and transportation in trains and steamships to which you trust yourself with every confidence in their strength and capacity to insure your perfect safety.

Hence it is the safest and most reliable material for fence. And, if it is properly galvanized and woven and put up as it should be, it will last for many years and give your land permanent protection.

And American fence—fence made by the American Steel & Wire Co.—is so constructed that you can adjust it to any unevenness in your ground and maintain uniformity throughout. It's lateral wires are big, continuous pieces, very tough and durable; while the upright, or stay wires, are hinged upon the lateral wires so that there can be no giving way. This makes a perfect square mesh fence.

American fence wire is annealed as it is drawn, which makes it stronger than ordinary fence wire. American fence is sold through dealers to give buyers the benefit of personal attention; but, if your dealer does not keep it, put off buying until you can write the makers and get a catalogue. That will enable them to see that your interests are properly looked after.

Address the American Steel & Wire Co. at any of their branch headquarters—Chicago, New York, Denver or San Francisco.

CARLOADS OF NURSERY STOCK.

Stewart Bros. are unloading this week another load of beautiful looking trees from the Oregon Nursery Co. The size and appearance of these trees are remarkable and attract much attention. The Stewarts say that the season looks as if the demand will be very great for all kinds of deciduous stock.

The company is now located at 712 South Spring street, Los Angeles.

DOKE'S REMOVAL.

The Doke Stock Food Company which manufactures the egg foods and "Lice Dope" which has been so successful on many a poultry ranch, has removed to 711 So. Main street, Los Angeles. The new quarters are far more commodious, more central and better adapted to the general business of this growing concern.

"The hen that lays is the hen that pays" is the slogan of the company, and the foods to make them lay is what they sell. Mr. Doke showed us many testimonials of pleased customers who have used the foods and found them satisfactory. "The best ever," is the way many express it."

Write the Doke Co. for further particulars of the goods.

Cultivator Advertising Pays.

Pasadena, Calif., Jan. 2, 1906.

Cultivator Pub. Co.

Gentlemen:—Stop my adv. at once and do not let it appear this week, as I am all sold out. I had good luck with your paper and am well pleased. May have more work for you in the future.

Yours,
F. S. LEE.

The mail order poultry supply house of the Jubilee Incubator Company, Sunnyvale, Calif., offers opportunity for all our poultrymen to purchase all necessary foods and supplies for poultry at the very lowest spot cash prices. They have recently issued a magnificently illustrated catalogue which they call "The Jubille Book." It consists of 80 pages illustrating and describing the well known Jubilee Incubators and Brooders and the Jubilee brands of poultry supplies. It is sent free upon request.

Farmers and others who may be interested in telephones will acquire some valuable information by writing to the Stromberg-Carlson Telephone Co., Rochester, N. Y., for their booklet No. 71. This firm is making a specialty of rural telephones and much valuable information will be obtained by a perusal of their literature.

Many of our readers will be interested in the information contained in the 1906 Seed Annual just issued by the great seed merchants, D. M. Ferry & Co., Detroit, Mich. It will be sent free to all applicants and is well worthy a careful perusal on account of the valuable information it contains. In writing them kindly mention you saw their advertisement in the Cultivator.

The Iowa Seed Co., of Des Moines, Iowa, send a finely illustrated catalogue of over 100 pages (with colored plates). devoted to descriptions of fruits, flowers and vegetables, the most ornate and comprehensive this company has issued.

VACANT LOT CROPS VALUABLE.

Philadelphia's public school gardens, which have been conducted this season on the vacant lots of the city, have flourished under the patient cultivation of more than 2,000 boys and girls, so that not only have the numerous unsightly lots been made attractive, but at least 850 poor families have ben aided in the struggle for existence. It is now estimated that the value of the vegetables raised on these 242 acres of school garden land will exceed $50,000. All this is aside from the educational value of the work itself to the little gardeners. In our California villages it would be an easy matter to maintain school gardens of vegetables every month in the year.

"My husband has asked me not to buy him any Christmas present this year."

"Are you going to?"

"Oh, yes. I need some things that I can't get any other way."—Cleveland Leader.

GOPHER DISEASE.

A. A. W., Beaumont, wishes further information regarding the infectious gopher disease published in our issue of December 29. The experiments noted were made in France and we do not know that anybody, as yet, has taken up the work in this country.

Waite, Bailey & Lynch, buy, sell, exchange, repair and install gasoline and steam engines, boilers, air compressors, power pumps, etc. Otto gasoline engines, all sizes, to 200-H. P., better built, more economical, therefore superior to all others; prices and terms that will insure due consideration. 943-945 N. Main st., Los Angeles, Calif.

San Francisco Examiner:

BREAST CANCER KILLS MOTHER

Two Sisters and Uncle Cured Without Knife or Pain.

Mrs. Elizabeth McClure of 1503½ Market street, San Francisco, Cal., lost her mother about a year ago after a surgical operation for a lump in her breast. Mrs. McClure and her sister each had a large lump in her breast, which became a poisonous eating cancer. Fearing they would die as did their mother they refused operation.

Hearing of Mrs. Crosthwaite's (954 Arlington avenue, Oakland, Cal.) remarkable cure without knife or pain by a wonderful Pacific Island plant extract, each sister and also an uncle had cancers cured within the same month, and, strangely, without one telling the other. These noted cancer specialists who discovered and use this remedy cure hundreds of cancers that no one but themselves and the patients ever know about. They charge nothing until cured and offer $1,000 if they fail. The cures are made in the privacy of the patient's own home.

Dr. and Mrs. Dr. Chamley & Co. are the doctors who cured Mr. E. J. (Lucky) Baldwin, Arcadia, Cal., of three cancers just three years ago after X-ray had made him much worse. Other physicians thought he could not be cured and would die in a few months. His testimony in his own words is in Dr. Chamley's book, which is the best ever published on cancers. It contains proof that any lump in woman's breast is cancer, also that any tumor, lump or sore on the lip, face or anywhere is cancer.

Dr. Chamley is declared by his patients to be one of the most honest, sincere and kind-hearted doctors they ever knew. He is the best authority in America on the cure of cancers, having cured more in thirty-three years than any other doctor living.

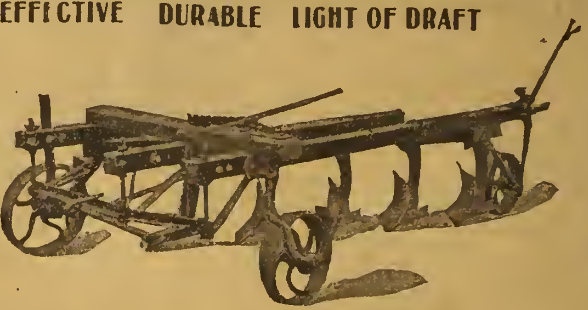
Stockton Reversible Gang Plow

EFFECTIVE DURABLE LIGHT OF DRAFT



This is our regular Plow and Land Shifter and Rear Lever. Land Shifter simple and durable. It is in easy reach of operator and there is no danger of wheel running over foot.

Houser & Haines Mfg. Co.
Stockton, Cal.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pumphead using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

$3.75 Per Dozen for Six Weeks Old Chicks

ADVANTAGES OF COULSON'S SPECIAL READY MIXED CHICK FEED

PUT SOME LIFE INTO THEM

You who are raising chickens and turkeys, and more especially young chicks. Don't you think it a good idea to PUT SOME LIFE INTO THEM, that is giving them food that will MAKE THEM STRONG AND HEALTHY?

You don't want to see your chicks droop around as though they were HALF ASLEEP, and then find every morning that 15 or 20 of them have KICKED THE BUCKET.

Coulson's Special Dry Chick Feed puts the life into them and makes strong, healthy chicks.

You know there is something in the heart of a grain of wheat or corn, that the mere heat of the soil makes it sprout into a living, growing plant.

You know there is something in the yolk of an egg, that the mere heat of hatching turns into a living chick. Sometimes there is not sufficient of the life-giving quality in the egg and the chick dies before it is hatched; and somtimes they hatch out more dead than alive, and the chicks drag out a miserable existence for a few days and finally give up the struggle, stretch out their legs and die.

There are many secrets in nature, but it is written in the Bible, "Seek and ye shall find." Suppose you should find this "something" that you could just feed it to the young chicks and give them STRONG VITALITY, so that they would grow—to beat anything you had seen before.

IT'S THE LIFE GIVING QUALITIES in Coulson's Food—THAT'S WHY Coulson's Special Dry Chick Feed raises the NICEST, LARGEST and HEALTHIEST CHICKS.

That is why Coulson's Food is different from the imitations.

A prepared Chick Feed composed of sound, selected grains broken to the proper size and blown free of dust is the most economical feed for young chicks. One hundred pounds will feed as many chicks as two hundred pounds of ground grain or cracked wheat. Why is it preferable?

The proper feeding of poultry is without doubt the most essential factor in the raising of any kind of poultry for profit.

AT ARMOUR PACKING CO., KANSAS CITY.

Loading cars of 400 bags of freshly cooked and baked hearts and liver meal. The small pieces of cook meat (about the size of a pin head), is used in Coulson's Special Chick Feed It is fresh, sweet and tender, and is great stuff to make chicks grow. If you want to raise a nice bunch of chicks, get a sack of Coulson's Special Dry Chick Feed.

Considerable advancement in the feeding of poultry has been made in the past few years, especially in the feeding of little chicks.

On nearly all the large poultry farms chicks are now started entirely on COULSON'S SPECIAL READY-MIXED DRY CHICK FEED.

SAVE YOUR CHICKS

Keep them from bowel trouble and all ailments incident to the first five weeks. Profit lies in the chicks you raise to maturity—not in the number hatched. Give them a ration that makes healthy, well developed bodies.

Coulson's Special Chick Feed

Contains ingredients that long experience in poultry raising has found best adapted to give nourishment to growing chicks. It is promptly digested; causes no indigestion; keeps the bowels in normal condition. Chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first five or six weeks. Save your chicks and make good profit.

Remember Mr. Bassett sold broilers only 6 weeks old for $3.75 a dozen.

TRY IT THIS YEAR.

Ask your dealer for COULSON'S SPECIAL CHICK FEED. Tell him no other kind is good enough for you. You want the best, and that's Coulson's.

Special Prizes to users of Coulson's Special Dry Chick Feed.
$500.00 to be given away. Look for a little envelope in every 10-pound sack of Coulson's Special Chick Feed.
Ask your dealer for Coulson's.

Practical Horticultural Sanitation

By O. E. Bremner.

In the culture of fruit, as in every industry, the older methods have been adjusted or have given away entirely to meet the conditions of a modern community. These improved methods have grown into the very life of California's people and as a result of this enterprise, California is firmly anchored in the security of her natural position in the fruit-producing world, and stands today upon her own resources; for generous Nature bestows her gifts on even those who receive them with reluctant hands, awaiting only the time when, aided by man's feeble devices she causes even the desert places to blossom as a rose and bring forth abundant harvest of golden fruit. The finest of our horticultural products today are, for the most part, the result of years of careful cultivation and selection, and it is reasonable to suppose that such specialized organisms are able to resist the ravages of disease and pests due to unsanitary and unnatural conditions. The problem that confronts the grower today is how to produce absolutely sound clean fruit at the least possible expense. Every lot of California fruit destroyed or refused landing in a foreign country or other State acts as a check on our industry. The markets of Oceania and the Orient stand with open arms to our California deciduous fruits in particular. Then why are we not supplying them? Our fruit will not pass the quarantine requirements, for it is a fact that the grower who sends a shipment to Honolulu, Australia or New Zealand does not stand an even chance of landing it.

If you have traveled through the deciduous orchards, it must have pained you, as it has me, to see the almost criminal negligence used in the propagation and distribution of our deciduous products. Our friends in the citrus fruit industry have learned their lesson and stand foremost in the production of clean, sound products. In many places I have found the brush from pruning an orchard used as a fence barrier around the orchard, for filling ravines, or thrown in waste corners. The culls of the fruit are allowed to remain undisturbed on the ground, or are dumped in piles at the edges of the orchards. Sacks are carelessly left in the crotch of trees to provide winter quarters for the Codling Moth. In one such sack I found 82 chrysalids, and in the entire orchard only 18 more, and those under the bark of dead limbs that should have been removed, practically the next year's supply of Codling Moth were contained in these few acts of carelessness. After pruning the trees the brush is dragged across the orchard and dumped in some ravvine or waste place and is not destroyed, if at all until the following spring. Meanwhile the dragging has disseminated the pests such as scale, tent caterpillar, canker worm, tussock moth, etc., which may have been confined to a few trees, practically over the whole orchard. A few apple boxes, a bunch of shakes, a few shingles or boards left in close proximity to an orchard, particularly apple, forms an ideal retreat for many of our worst pests.

Do you own a small dryer or packing house, and did you ever stop to think what proportion of the Codling Moth you were affording winter protection in your house to infest your orchard the following spring? Over 90 per cent. Is there a grower here who does not believe it? Then go into your own orchard the last of February or March, and start on a hunt for moth larvae and chrysalids. If your orchard is well taken care of, no dead limbs or loose bark hanging over large sunburned areas, sacks in the crotches, old bands which you have not removed, you will be greatly surprised at the extremely small number you will find in half a day. I said your dryer contained 90 per cent but in most cases I belive it to be 99 per cent. Well, no, not the dryer alone but including the pile of fruit boxes in the shed or against the back of the dryer or barn; for in nearly every box you will find from one to fifty larvae or chrysalids. If you think your packing-house does not contain Codling Moth, just knock off a brace on your peeling table or a batten on the side of the building. I have found over one hundred under a single batten, three feet long an a window sill. I have taken 25 from a three foot tray in a packing house; around the bins where the apples are stored I have taken hundreds.

Gathering Prunes in San Joaquin County.

I think I am quite safe in saying we are controlling every pest, with the exception of the Codling Moth, in our California apple orchard today, where proper precautions are used. The pernicious scale, which once threatened the destruction of the industry, is practically a thing of the past. The other insects and diseases are now readily controlled by proper methods. But the Codling Moth gains each year, in spite of the deluge of noxious and poisonous sprays. What then are we to do? My contention is a change in the methods of combatting this persistent foe. Do not wait for the moth to storm our parapet of arsenate of lead or Paris Green, but carry the fight into his own country, rout him from his winter quarters. I speak more particularly of the Codling Moth for several reasons. Its destructive work is perhaps more widely disseminated than any other pest on account of the universality of apple and pear culture. Fruit growers are at present exercising greater care and are putting forth greater exertions to eliminate this pest than any other one insect. And on California in particular is centered the interest of all other apple growing states and countries on account of our present parasitic campaign against this insect. While I do not believe this cleaning up campaign would of itself exterminate the Codling Moth, at the same time, I believe it would greatly facilitate the work of the parasite.

The grape industry is another example of where careless methods resulted in great losses. The introduction of Phylloxera into many sections has unquestionably been by the shipping of boxes long distances from infested regions into unaffected vineyards. The mixing of boxes at the cellars has a tendency to quickly disseminate the pests throughout districts. It is conceded by all that the introduction from one country to another by means of rooted cuttings is, at the present day, inexcusable, yet I have seen growers replanting with diseased vinifera, areas destroyed by Phylloxera, and the cutting themselves have already been infected while still in the nursery. The rapid increase in a section is often or generally augmented by careless cultivation and failure to isolate the plague spots. I have even seen a vineyardist buy old stumps, pulled out on account of their condition due to Phylloxera and still maintaining living roots, haul them home for firewood, and dump them in close proximity to his vines. Cases of Phytoptus vitis, where the brush should have been destroyed on the spot and is instead dragged through unaffected portions, occur through being scattered and spread in this manner. I might go on almost indefinitely and give examples of this kind, of how spiders, mites, insects, fungi and bacteria are harbored and distributed by the loose methods which at present pervades the cultivation and distribution of many of our most important products; of the rapid and almost universal spread of the devastating pear blight; of the consternation caused by the increasing ravages of walnut blight; of the evident increase of grape diseases on the Pacific Coast; of the dissemination of the asparagus rust. But why call up unpleasant reminiscences. The thing that should command our interests and guide our exertions is how to stop this onward march of destruction by those forces. If the taxes we now pay were actually increased by the loss sustained by the insect pests alone, the storm or protestation that would assail those responsible would sweep away all opposition. But this inertia, manifested by the growers in removing this tax, which, by good authority, amounts to over $700,000,000 annually in the United States, alone, is quite inconceivable.

The laws of California are certainly comprehensive enough. They read, "infectious diseases, scale insects of any kind injurious to fruit trees, fruit, vines or other plants or vegetables. Russian thistles or other noxious weeds. Codling Moth or other insects that are destructive to trees." The State and County Commissioners are also vested with ample authority to deal with all cases. Then it must be up to the growers to set on foot the movement that is to sweep away all opposition. Opposition? Where does it come from? Must I say it? The grower himself.

It is quite common for men with orchards and living in orchard sections, to order by mail, express or freight, fruit trees, shrubs, plants, etc., from nurseries outside their county

(Continued on Page 71)

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

.WHAT AILS OUR WHEAT? .

What is the matter with California wheat? We are told that it lacks gluten, and a corps of scientific men are now engaged in the attempt to find or breed a new wheat which will produce gluten in our soil. And yet it is only within the past few years that we were informed of the shortage of this necessary element in our wheat. Years ago there was no complaint of this kind; California wheat was sent into the farthest markets of the world and was reputed the best wheat grown. It was used by eastern millers to mix with their home grown wheat to give the very quality in which it is now deficient. There was no complaint of a lack of gluten in it then. But we have cropped the same land to wheat year after year for the past forty or fifty years, and no one ever dreamed that it was necessary to restore to the soil some of the qualities which it was being deprived of. Crops of wheat have gradually grown smaller and the grain of poorer quality until today we get a very light harvest, when we get any, of poor, shriveled grain without gluten, and likely without other desirable qualities. Now we ask aid of the scientific men, who demand big appropriations for their work, and then set about inventing some new wheat that will have sufficient gluten to make it desirable. In view of the fact that we produced such large crops of superior wheat year after year while our soil was new, and that now under the same circumstances of soil climate and conditions, we cannot produce in any year a marketable wheat, it would seem to indicate that it is rather a case of soil exhaustion. We are in the condition of the spendthrift who has drawn aginst his bank account and made no deposits for years, and who suddenly awakes to find his drafts dishonored. We have been draining our fields of their fertile elements for years and now awaken to the fact that there is none left. It is to be devoutly hoped that our scientific friends will discover or produce the new glutinous what that we want, but in the meantime experiments might be caried on with a new seed, deep plowing, and fertilization.

STATUS OF COUNTY HORTICULTURAL ORDINANCES.

There have been so many inquiries as to the authority and power of county horticultural commissioners under the various county ordinances, that State Commissioner Cooper formulated a series of questions covering the most important matters and submitted them to the attorney-general. These questions and the replies have been published in the last circular from the office of the Horticultural Commissioner. Probably the most far reaching of these answers is that relating to the total prohibition of nursery stock from any section. Several counties in which the phylloxera and Anaheim disease do not exist have put an embargo on all grape vines from any section, for dread of these evils. How the attorney-general's opinion will affect these we cannot tell, but here is what he says in the matter.

Your fourth question is as follows: "If county boards of supervisors have authority to pass a horticultural quarantine law, can they pass a general ordinance declaring all nursery stock or grapevines brought into their county from any other part of the world a nuisance, without any inspection of the stock?"

"It is my opinion that ordinances so sweeping in their nature as you describe would be held by the courts to be unreasonable and void, as arbitrarily declaring that to be a nuisance which was not a nuisance. To make an occupation indispensable to the health and comfort of the civilized man, and the use of the property necessary to carry it on, a nuisance by a mere arbitrary declaration in a county ordinance and suppress it as such is simply to confiscate the property and deprive its owner of it without due process of law."

* * *

A HARD PROPOSITION.

The lot of the Commission appointed for the purpose of selecting a site for the new Agricultural College farm, is certainly not a happy one. There are so many opposing interests, so many locations which, in the estimation of their own people, possess the only requirements of the bill, that it is very difficult indeed to choose between them. One thing, however, upon which all seem to be united is that the farm shall not go to Berkeley, where it is believed there is an effort to put it. All the associations of farmers, dairymen, stockmen and fruit growers have passed strong resolutions against this, and should their wishes in the matter be disregarded, it might very seriously effect any legislation in favor of the University at the next session of the legislature, and render the commission unpopular with the class it represents. To meet all requirements, as much as possible, Prof. Wickson is now investigating the qualifications of the sections, and will make his report later to the whole commission. It does not follow that his report will be final, but it will have great influence. One of the most startling propositions in connection with the whole matter, however, is the offer by Mr. Theodore Kearney, of Fresno, of 320 acres of his property as a free gift to the state for the purpose of establishing the farm in Fresno. This tract is one of the most valuable in the state and is a very valuable donation, representing some $80,000. Of course, the donation of the land is not the only consideration, and it might be dear in the long run to accept something for nothing, but the offer is a very liberal one and all things being equal, should be accepted if possible. But whether accepted or not, Mr. Kearney still deserves credit for his liberal offer.

* * *

CLOVERDALE CITRUS FAIRS.

The people of Cloverdale intend this season to surpass all their former efforts in the matter of a citrus fair, and are already adding very largely to the pavilion in which these fairs have been held for the past thirteen years. Cloverdale grows some good oranges, not enough for shipment, but enough to make a good advertisement for Sonoma County. Really, these citrus fairs are very creditable. There is always a very large display of most excellent fruit, and if atended, one would really believe that Cloverdale was the center of a great citrus section, while the truth is that it takes about all that is grown to make up the fair. Still they show a spirit of enterprise that is truly commendable and have done much toward drawing attention to this portion of the State. Perhaps the people around here could grow more citrus fruit if they tried, but in answer to a question put to one of the leading citizens of Cloverdale as to why, when they grew such good fruit as they exhibited, they did not grow more, he replied: "Do you think, when we can get $300 per acre from our grapes and get returns in three years, we are going to bother with oranges and wait ten years for a crop which would pay no better?" That may be why.

DON'T TAKE A CHANCE

Practical Farm Science

GREEN MANURING.

Green manuring is the process of plowing under green crops for the purpose of adding organic matter to the soil with its accompanying mineral matters to increase the soil fertility. This process is usually applied upon loose soils that are deficient in humus, in order to increase this material in the soil, and thereby securing its beneficial effects upon the power of the soil to retain moisture, to acquire gases from the air, and to hold other manures that may be applied to the soil.

On heavy soils the large amount of green matter plowed under tends to divide and lighten the soil by its mechanical effects, and in its fermentation or decay induces chemical reactions in the soil that decomposes the minerals of the soil. These effects added to other well-known effects of humus in the soil, have led to the very extensive practice of green manuring of late years and its advocates double in number each year. There is no State in the Union where green manuring should be more extensively practiced than in California, and our farmers are rapidly awakening to its importance.

GREAT AID TO AGRICULTURE.

A Canadian agricultural society is said to be doing valuable work by giving prizes for the best kept farms. It is suggested that if this scheme were adopted in place of exhibitions in some localities it would be a great aid to agriculture. It is also suggested that some of the money spent in fairs might be used by agricultural societies in the purchase of pure bred animals, for grading up native stock. Anything that aids a farmer to feel greater pride in his surroundings, whether the condition of his farm or the quality of his stock, is legitimate work for an agricultural society. A competition for the best farm might have a wonderful effect in the improvement of a rural neighborhood.

THE OLIVE TREE.

The tree is slow in reaching maturity, but after the fifteenth or sixteenth year it bears on indefinitely and seems never to lose its vitality. There are trees in the garden of Gethsemane estimated to be over a thousand years old, still in full sap and vigor. It is of all fruit trees the hardiest, for scarcely any amount of mutilation, any severity of frost, or even sharp scorching by fire, sufficies to destroy its life. "So long as there is a fragment remaining, though externally the tree looks as dry as a post, yet does it continue to bear its load of oily berries, and for twenty generations the owner gathers fruit from the faithful old patriarch. This tree also requires but little labor or care of any kind, and if long neglected, will revive again when the ground is dug or ploughed, and yield as before. Vineyards forsaken die out almost immediately, and mulberry orchards neglected run rapidly to ruin; but not so the olive. Though they may not have been attended to for half a century, yet they continue to be a source of income to their owners."

It is unwise to use a spavined mare for breeding purposes.

THE RUSSIAN THISTLE.

The Russian thistle or Russian cactus (Salsola kali var. tragus) is really neither a thistle nor a cactus. Saltwort is its true English name, but to the farmers, who are best acquainted with the plant, it is known as the Russian thistle.

The weed is an annual, growing to a height of 6 inches to 3 feet, branching profusely, and when not crowded forming a dense, bush-like plant 2 to 6 feet in diameter and one-half to two-thirds as high. When young, it is tender and juicy throughout, with small, narrow, downy, green leaves; but in late summer it sends out hard, stiff branches which bear, in place of leaves, sharp spines, one-fourth to one-half inch long. At the base of each cluster of spines is a papery flower about one-eighth inch in diameter.

WHAT A FARMER SHOULD KNOW.

Here are a few of the things which a thoroughly successful farmer must know:

1. Botany enough to enable him to understand the nature of his crops and how they grow.
2. Geology enough to know the different kinds of soil and their properties.
3. Entomology enough to know which insects are pests and which are friends.
4. Ornithology enough to know which of the birds are injurious and which are helpful.
5. Forestry enough to know how properly to preserve, extend and harvest his woodlands.
6. Horticulture enough to know how to manage his fruit and vegetable gardens.
7. Veterinary science enough to understand his horses and cattle and their ailments.

He must have ability and push enough to enable him to apply his knowledge of all these things in actual practice. In addition he must be a carpenter at times, he must know how to mend harness, file saws, sharpen axes, and care for machinery. He must possess public spirit and manliness enough to make him a valuable member of his community, common sense enough and business methods enough to enable him to guide wisely all the ends of a very complicated business. Yet some people who do not know any better, think any ignoramus can be a farmer. It takes a man to be a good farmer.

NITROGEN CULTURES FOR THE TREATMENT OF ALFALFA SEED.

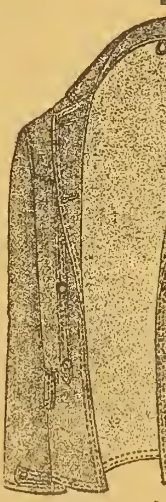
A number of inquiries regarding nitrogen cultures for the treatment of alfalfa seed have reached this office. A renewed interest in the subject of the inoculation of alfalfa seed with nitrogen-fixing bacteria has been manifested since the discovery by the United States Department of Agriculture of a method whereby the nitrogen cultures may be prepared in such form as to be sent out by mail. formerly soil from fields known to contain the bacteria was transported and spread on the fields to be treated. This method was laborious and expensive.

It may be in place just here to briefly discuss the action of this bacteria. Nitrogen-fixing bacteria must not be confused with nitrifying and de-nitrifying germs. The nitrifying germs attack humus or other vegetable matter in the soil and liberate nitrogen in a form which can be used by growing plants. This class of germs of which we write act very differently. They are able to assimilate and use for building up their own bodies the free nitrogen of the air. The plants grown on the farm can not use the free nitrogen of the air, although about four-fifths of the air is nitrogen. Some farm crops can, however, obtain this free nitrogen from the air with the assistance of a certain kind of bacteria. These bacteria live and multiply in the tissues of the plant roots, thus forming little knots or enlargements on the roots from the size of a pin head to that of a pea or larger. In return for the shelter afforded by the plant roots the bacteria provide nitrogen for the plant, and this nitrogen is not obtained from decaying vegetable matter but is taken directly from the abundant and cheap store found in the atmosphere. This kind of bacteria can live only in the roots of the class of plants known as legumes, such as alfalfa, red clover, vetch, peas, beans, etc.

Any farmer can secure nitrogen cultures, in the order of receipt of requests, by writing to (Director) A. C. True, Office of Experiment Stations, U. S. Department of Agriculture, Washington, D. C., stating the number of pounds of seed to be treated, the kind of seed to be treated and the date when the seed will be sown.

Fortune—"What's the matter, dear? You look excited."

Mrs. Fortune—"Excited! Why shouldn't I? The new chambermaid complained of a headache, so I sent her up stairs, and told her to take things easy. She did. She's gone off with all my jewelry.—Judge.



HOEGEES'

Deciduous Fruit Culture

SOUR SAP IN FRUIT TREES.

Sour sap may be brought about in various ways, but the immediate cause is the action of ferment in the sap. All ferments of this class are caused by some form or organism known as bacteria which gains access to the circulation, causing unhealthy conditions. The most frequent cause of this condition, is wet feet. If a tree has not good drainage, the circulation of the sap becomes deranged and the result is sour sap. A tree may stand in an excessively wet place for a long time during the cold winter months when it is dormant, and not be injured, but it will succumb in a much shorter time if this condition obtains during the warm spring time when the sap should begin to move rapidly. Trees with sour sap are readily recognized by offensive sweet odor they emit during the first stage or when the sap is just turning. The trees will make a faint struggle to send out blossoms and leaves sometimes, but if the ordor is present, it is too late to apply a remedy. Its doom is already sealed. The remedy should lie in a preventive at the time of planting.

Land that is liable to become wet and has not perfect drainage at all times, should never be planted to fruit grafted on peach root. Plant nursery stock grown on Myrobalan root, and if the land is liable to be excessively wet, do not plant peach trees at all. Plums on the stock mentioned, or pears should be planted there.

Gumming of the trees is sometimes confused with sour sap, but it is entirely different and the cause is not well understood. The remedy is however, simple, and in most cases is effective. When the bark of the tree looks dark and spots of gum or moist appearing places show, it is a sign that the circulation is not right, and in such cases, the trunk and main branches should be slitted with a sharp knife on at least three sides. This admits of the escape of the sap and gum which would otherwise force its way around under the bark of the trunk or branches and thereby girdle them. When treated this way, the heavy bark will at once expand and new and healthy bark will form in the lines of incision.

GRAFTING RESISTANT GRAPES.

Grape grafting is most successfully done late in the spring. When the first buds open on the vines, saw them off an inch below the ground, split with a chisel and insert a wedge-shaped scion with two buds on it. Cut your scions so that the lower bud comes on the outside and even with the top of the stump. Do not use any cloth or wax, but mound up with earth so as to cover all the scions at least an inch above their tops.

The scions should be kept in a cool place that is not too damp. When they are inserted in the stump in the spring, they should be in good condition, but not sappy. If they are a little drier than the stump, they will commence to take sap from it immediately. You had better put two scions in each stump and let both grow all summer if they will, in case your stumps are over an inch in diameter, and at the next pruning time cut one off. As the young tops gain strength, the dirt can be hoed away from the bases. As soon as they grow to be 10 inches or a foot high, they should be tied to the stakes or the wind will blow a great many out, or bind them so that it will be impossible to break out the graft. If any should get down unobserved, do not try to straighten them up at pruning time without first digging away around the roots so that stump and all can be pulled over so as to make the top straight. It is better to have a crooked stump under the ground than a crooked top or no top at all. At one year from grafting, the point of union is not strong and it does not take much of a strain to break them off there.

THE ANAHEIM DISEASE.

The Anaheim disease (which did not originate at Anaheim) is readily distinguished in several ways and should never be mistaken for mildew or vice versa, as is frequently the case.

The chief distinguishing feature is that the change in color of the leaf in the case of the disease takes place in the tissue between the midrib while in case of mildew, the discoloring shows up on the midrib, while the tissue between remains healthy.

Different varieties of grapes are differently affected, those bearing light fruit always having a light discoloration of the leaves, the tissues between the midribs turning light yellow at first and finally dying around the edges and center of the spaces and turning brown. The leaves nearest the base of the canes are soonest affected and die and drop first. The leaves do not drop from the vine in the usual way, the stems staying on the canes for some time after the body of the leaves have dropped. This applies to different varieties of grapes.

SPRAYING FOR THE PEACH MOTH.

The peach moth (Anarsia lineatella) has proven a very serious pest to many peach and apricot growers in the northern orchards. This pest passes the winter usually in the crotches of the young twigs in a dormant state, becoming active as the sap begins to flow. With its renewed life it starts for the surface and should be checked before it escapes. To this end the salt, sulphur and lime spray is recommended, and this should be applied as late in the season as possible, so as not to affect the new growth. By spraying late the worm can be caught when near the surface, the wash penetrating into their shallow burrows and killing them. If the spraying is done early in the season, however, the young worm is covered beneath such a mass of debris and excrement that the wash will not penetrate to it, and for this reason late spraying is recommended.

QUALITY IN STRAWBERRIES.

Quality counts in strawberry production quite as much as in other lines, sometimes vastly more. We came across an instance illustrating this in an exchange recently. The narrator resides at Reading, Mass., a well known center of strawberry production, where the growers take pride in putting only the best on the market. He writes: "When ordinary berries have been selling in Boston as low as ten cents a box, some of the Reading berries have been sold as high as twenty-five and thirty-five cents a box, consequently it has paid the farmers here to devote as much time as they can in developing the strawberry to a degree of perfection, going into the largest markets and practically selling at their own price." That's worth thinking over.—The Strawberry.

San Dimas Citrus Nurseries

How to Grow Oranges?

Easiest thing in the world—next to getting rich. All there is to do to get rich, you know, is to get lots of money and keep it.

To grow oranges—fine ones that bring big money—you must have Good Trees, Good Soil, Right Climatic Conditions, and a hundred and one other things.

But if the hundred and two or three other things are just right and the trees—the little nursery trees—are stunted or indifferent as to pedigree, failure, or but poor success will result.

Therefore start right

Get a copy of "How to Grow Oranges," which contains a fund of information. To be had for the asking.
Then buy the best trees to be had and save years of exasperation.
The best only are grown at the San Dimas Nurseries. Thrifty, stocky roots. Buds true to name and of strong bearing trees.

Write at once for "How to Grow Oranges, addressing

With the Citrus Growers

BY C. A. DAY, PASADENA, CAL.

HARVESTING THE ORANGE

In the reports of the condition of oranges delivered in the Eastern markets for the fore part of the month of January, we find in many instances the following: "Fruit pale, spotted, scarred and small sizes." Fruit of this character does not sell well and if shipped on order is frequently rejected and is diverted to the auction markets often to be sold for only enough to pay the expense of harvesting and shipping. In order to market the navel crop of oranges it is necessary to begin shipment with holiday fruit. These holiday shipments usually close about the 10th of December, the main shipment beginning with the new year. This year, with the good prices for holiday fruit the early coloring of the oranges, the shipments continued through the month of December. The continued forwarding to market of pale colored and sour fruit has had a depressing effect upon the markets and has not added to the reputation of California navel oranges. There is an Eastern demand at this time of the year for well colored sizable fruit and this demand should be supplied.

The fault lies with the growers and shippers who insist on forwarding immature fruit. In picking oranges at this time of the year care should be taken to select as to color and size.

In the matter of size, none smaller than 216's should be picked. One reason for this is that there is but little or no demand for smaller sized fruit in early winter. Another reason is that the smaller sized fruit, if left on the tree until later in the season will grow in size, giving more fruit and of desirable sizes. As the orange crop for this year runs to small sizes it will more than supply the demand for such sizes. Last year we had an over-abundance of large sizes, which were discounted. It will certainly be wisdom on the part of the growers to hold the small oranges on the trees and get the increase in size. As to color, the market demands well colored fruit and the deep orange-colored fruit only should be picked. Pale colored fruit shows one of two things, artificially colored fruit that is particularly green and colored by the sweeting process, or immature fruit picked from the tree before it has the required color. To secure the class of oranges we require it will be necessary to carefully go over the trees from time to time selecting the matured fruit with regard to color and size. It is probable the going over the trees once a month is the ideal method. This method of harvesting will relieve the heavily loaded trees and give the smaller sized fruit an opportunity to grow into desirable sizes. By this method the grower will be furnishing the quality and size of fruit which the market demands. Such fruit carefully picked, cleaned, graded, packed and delivered sound will sell to the best possible advantage. It will cost more to pick oranges by selecting only those fit for market in this way, than to turn in to the orchard a gang of careless pickers, with the result that half ripe and small-sized oranges will be picked. The carefully selected fruit will sell for more than enough to pay for the extra expense or selection.

From what I can learn more care is being exercised in picking oranges than formerly. This is probably due to the excessive decay of last year and to Mr. Powell's investigations. There are the two extremes of too long stems and a close cut with injury to the orange. With careful work in picking the percentage of decay will be materially decreased. There is but little puffing this year and what little there is may be charged to faulty culture. If there are any frozen oranges in California, past experience will teach the growers the futility of shipping such fruit as it is easily detected on account of its light weight.

If reports are true the present crop of navels is of good quality and less in quantity that that of last year and with the repeated short supply of other fruit in market the prospects for top prices are good. So far as I have observed there is a full set of seedling oranges but the size at the present time are small, but with favorable climatic conditions they may size up.

There is a good set of Valencias but in the Pasadena section they are small in size and for some reason unknown to the writer are coloring up.

We see instances of half grown fruit that is turning yellow.

INSPECTORS' REPORTS.

Several counties in this State have monthly meetings of horticultural commissions whereat the several inspectors are required to read their monthly reports, each report being discussed by those present, all interested visitors included.

A representative of the Cultivator recently attended such a meeting in the rooms of the Los Angeles commission, six inspectors reporting as follows: Frederick Maskew, Long Beach; C. A. Day, Pasadena; C. L. Northcraft, Pomona; C. B. Blain, Sierra Madre; Wm. Wood, Whittier; and C. E. Bemis, Covina. Among interesting facts elicited were; Wooly aphis may be carried to distant orchards in irrigating ditches; in fumigation more water and longer exposure (1 hour to all night) is necessary to effectually combat our most serious citrus fruit pests; deciduous fruit trees are being shipped in from Colorado, Utah, and points farther East: Sierra Madre orchardists can make more money by uprooting their lemon trees and growing winter vegetables; the late frosts have done some damage to citrus orchards and played havoc generally with nearly all vegetables, strawberries, etc.; that the Whittier pathological station expert has succeeded in making dry cultures of the bacterial walnut disease, thereby proving it may spread very easily; and a host of other valuable points pertaining to horticulture. The educative value of these meetings can not be over-estimated.

SAN BERNARDINO COUNTY HORTICULTURAL COMMISSION

The report of the financial operations of the San Bernardino county Horticultural Commission for the year 1905 has been completed by Commissioner S. A. Pease.

It shows that the total cost of the commission, which includes the work both of commissioners and inspectors, was $9,309.14. This is what it cost the tax payers of the county. The operations of the commission covered a much greater scone, a total of $41,360.99 having passed through its hands. This is occasioned by the fact that while the county furnishes the machinery for fumigation as well as all expenses of inspection and incidental duties, the cost of fumigating itself is paid by the owner of the orchard benefitted, and this in turn paid back into the treasury constituting a sort of revolving fund.

The plant for carrying on the war against scale pests was increased during the year by the purchase of $4,220.61 worth of apparatus, including two power sprayers and 99 tents, which are in good condition and are therefore an asset. With the cost of these included in the outlay, it amounted to $13,529.75.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

SAVE OUR TREES.

The story, credited probably to Ruskin, is not new, of the tree in the forest and the manner in which it appeals to different natures or to people of different environment. There is the capitalist who looks at it and says, "trees are getting scarce; that is a fine specimen. Lumber is worth more each day and I must cut as soon as it reaches maturity. I will figure how much it is worth." The lumberman looks it over critically and says to himself, "it will make so many cuts and so many boards and so much waste." The botanist "discovers" it some day and tells its name, its family and its genalogy. The artist sees it, and its branches are a joy to his soul. The light glints on its leaves, the strength of its mighty form appeals to his genius—and he charms tired humanity with a bit of old mother-nature transferred to canvas. Then on a day, comes the poet. He sees the big tree, so calm and so restful, standing with its brothers in the forest. He lies down under his shade and looks at the blue sky through the windows in his roof. He thrills to the song of the birds who live there and he imbibes inspiration from the monarch of the ages, whose life is so like unto the life of man. He is able afterward to sing a song which endures in the hearts of men and on the printed pages, for the space of time that humanity is alive.

Part of the standpoint of each of these men is the result of education, and only a part, for in each man there is some degree of the qualities of all. A child is an incipient poet or artist or plodder. He has potentialities and he has a right to be developed along the lines of least resistance. Nothing is so useful in development as knowledge. Trees and plants are like people, they show us much finer natures, if we are acquainted with them, than we ever dreamed they possessed. A child has all possibilities and a hint in the proper direction may make or mar his character and his work for life. Why then should we, of all people, not extend to the litle ones in our midst all the benefits of the refining and bettering of humanity which lies in the friendship of trees and plants? Introduce the child to the tree and the rest will come. If the tree and the bird are the personal friends of the child, when he is a child, it is likely he will not forget that friendship when he is a man, and the life of all nature will be more sacred to him. He will not wantonly destroy a tree and he will know the value of a little piece of earth and a few plants to his home and his family. The big trees of California forests, which constitute great value and the principal beauty in this State and which cannot be duplicated on this or any other continent, are in constant danger of annihilation by commercial-spirited individuals. Therewith appeals to all who love nature's beauties and to all fair minded citizens to organize and to take vigorous, united action for the preservation of our forests.

More than a dozen inquiries have come to us during the past few days regarding base of supply for tropical fruit trees, the hedge plant (Atriplex Breweri) etc. We advise those desirous of obtaining these plants to write to our advertisers of ornamental stock.

AGRICULTURE IN OUR SCHOOLS.

The city is a magnet that draws the population from the country. Fewer farmers are needed from decade to decade because each farm worker can produce proportionately more than formerly. The enlarged percentage of population in the city and the lessened proportion of people on the farm is a result of economic and industrial changes, not of mere sentiment, as some philanthropists assume. It is far easier for rural people to become city people than for city children to be educated to live and work in the country. The city needs a constant supply of strong people from the country, and God pity the day when the city can no longer bring in virile blood from the country.

We must take the situation as we find it. We do not want too many people in the country, because that would mean an over-production of rural products. We want only so many people in the country as will get sufficient renumeration for their work, so that the children may have the means for at least a high school education. Our city high schools lead from the farm; our agricultural high school educates a goodly number for the farm, and its capacity should be rapidly multiplied, because it makes a class of people who are really trained in the science and art of farming and farm home making. But, how are we going to get hold of the hundreds of thousands who do not pass beyond the country schools?How are we to teach the great mass of the country youth better farming and better home making? We must first modify the education of the teachers of the rural schools. If we could have one generation of rural school teachers, who, without lessening the effort for good instruction in the common branches, could teach of the farm and the farm home, the next generation of farm boys and girls would be better prepared to become teachers of the generation following them. Through our agricultural school, through our summer teachers' institutes and through other agencies, we must train a class of rural school teachers.

BEAUTIFY YOUR FARM.

While we are all doing our little bit in the city for the improvement and beauty of the town of our choice, our country brethren should not lose sight of the fact that a little energy and care along the same lines will bring forth abundant fruit, say a writer in The Ranch.

Well kept lawns, clean streets, and alleys, vacant lots kept well cleared of weeds—these things are all part of the work of keeping a city clean, healthful and pretty. They attract residents and draw capitalists. But while all these things are being cared for in the town, why should our country neighbors neglect them utterly? There is such a thing as "the farm beautiful" and the results are as correspondingly valuable and satisfactory as is the work of making "the city beautiful."

A drive through the adjacent farms shows well kept orchards; the fields show an abundant harvest; the cattle are sleek and well fed—but the surroundings of the farm house, in too many cases, are almost everything that they should not be. The lawn—if there is any—is ill kept; the steps are worn out; perhaps there are pickets broken and gone from the front fence; weeds have grown up along the roadside so as to almost shut off a view of the premises— the whole farm shows that there is no effort made to make it look attractive or more beautiful than the many places around it which are no better than it is.

Beauty will add to the value of any farm. It is an added asset which costs the smallest amount of money. Those who would make the country more attractive and add dollars to the value of their properties should pay more attention to these things.

SWEET PEAS AND BEES.

An interesting point in natural science is being discussed with regard to sweet peas. It is said that stocks of some varieties have shown an unusually large proportion of "rogues" this season, which is attributed to the prevalence of a humble bee, which in visiting the flowers pulls down the keel by its weight and exposes the pistil, thus effecting cross fertilization. Growers with a turn for natural science may be glad to have their attention turned to an interesting subject for investigation; others may perhaps welcome a good excuse in case they are troubled with complaints as to mixed stocks.

This cane sugar, more or less converted by the bees into invert sugar, is laid down in the comb; but according to the definition given above is not, strictly speaking, true honey—Prof. A. W. Ogden.

TAMARIX GALLICA.

This popular plant which is known by the common name of "Tamarisk" is suited to all soils and conditions. It will grow in water or the driest soil, as well as in salty ground and seems to thrive everywhere. In several countries it is used for binding shifting sand. Locally the fine, large sprays of pink blossoms are much in demand by the florists for decorating purposes.

FERRY'S SEEDS
Make sure a yield of quantity and quality. When your father planted Ferry's, they were the best on the market, but they have been improving ever since. We are experts in flower and vegetable seeds.
1906 Seed Annual, beautifully illustrated, free to all applicants.
D. M. FERRY & CO., Detroit, Mich.

THEODORE PAYNE
SEEDSMAN AND NURSERYMAN
HAS REMOVED TO
345 SOUTH MAIN STREET
HEADQUARTERS FOR SANTA BARBARA SALT-BUSH (ATRIPLEX BREWERI)

If You Knew You Could Double Your Crop and Enhance Its Quality by Securing Plump, Fertile and Sure-Growing Seed, You would Do It Immediately.
If you will favor us with an order for any of the following sure-growing vegetable seeds, which we are offering at prices within the reach of all, your hope will be realized:
ONIONS—Prize-Taker. Pkt, 5c; oz. 10c; 1-4 lb, 40; lb, $1.35.
LETTUCE—Curled Simpson. Pkt, 5c; oz. 10c; 1-4 lb, 25c; lb, 75c.
CABBAGE—Extra Early Eureka. Pkt, 5c; oz. 10c; 1-4 lb, 35c; lb, $1.25.
BEETS—Improved Blood Red. Pkt, 5c; oz, 10c; 1-4 lb, 20c; lb, 50c.
CARROTS—Ox Heart. Pkt, 5c; oz, 10c; 1-4 lb, 20c; lb, 50.
If you plant these seeds you will get results in bounteous crops which will prove a pleasure and a profit.
F. Gilman Taylor Seed Co.

THE ANAHEIM EVERGREEN NURSERIES
Tim Carroll, Prop.
Anaheim, Orange County, California
The Oldest Nursery in Southern California
Established 1868 by the Present Owner.
Palms, Pines, Acacias, Cypress, Camphors, Eucalyptus, Guavas, Budded Loquats and all kinds of Ornamental Trees. Be sure and visit the Nurseries. A cordial invitation to all. Nurseries, 200 yards west of Loara Station, S. P. R. R. Our fine Illustrated Catalogue free. Write for it.

In the Vegetable Garden

GREAT VALUE OF VEGETABLES.

There is not a single garden vegetable that has not a medicinal quality aside from its food value. The first thing to come in the spring is asparagus, valuable in all kidney complaints and a most delicious dish. Then we have rhubarb, which counteracts the effect of the usual heavy meat diet of winter and clears the system of some of the acids that produce dyspepsia, rheumatism and other painful maladies. Radishes are good for stomach troubles, dandelion greens make a good blood purifier, horse radish is a tonic and makes the appetite good. Onions cure colds and bring sweet sleep, and celery and lettuce soothe the irritated nerves. Carrots are good for scrofulous tendencies, cucumbers are wholesome and cooling, notwithstanding the bad reputation they have, and parsley is known as a palliative in cases of dropsy. The whole list of vegetables might be named and a positive medicinal value given to each of them. A well-filled garden, the products of which are used regularly in the family, furnishes a variety of medicinal agents which meet the requirements of a large number of people and fortify them against the germs of diseases, giving them immunity from attacks that would prostrate them if they were not defended by the use of a rational diet.

THE TREE TOMATO.

Everyone who has grown the tree tomato (Cyphomandra betacea), where the climate is sufficiently mild to allow of its perfect development, is loud in its praises. Only in our most favored spots is it free from the effects of frosts; but in such localities every one should have at least one tree of it. In less favored countries it is grown for its fruit in specially constructed glass houses, and proves a profitable investment.

When well grown the tree is literally weighted down with a crop of medium-sized, pear-shaped tomatoes of a redish orange color, rich in taste and firmer in flesh than the ordinary tomato, and for the latter reason is a much better keeper and would easily ship long distances. Many prefer the fruit to that of the herbaceous tomato vine.

.FERTILIZER FOR POTATOES..

Experiments with commercial fertilizers show that for potatoes, potash is the most important element and sulphate and muriate of potash were generally more satisfactory than kanit. The results also indicated that where commercial fertilizers alone are used a complete application, consisting of 1 1-8 cwt. of nitrate of soda, 7-8 cwt. of sulphate of ammonia, 3 cwt. of superphosphate. and 1 cwt. of muriate of potash per acre, furnishing 40 pounds each of nitrogen and phosphoric acid and 60 pounds of potash, is to be recommended. Barnyard manure gave better results this season than commercial fertilizers. The combined use of barnyard manure and commercial fertilizers is considered profitable for potatoes, and an application of 12 tons of barnyard manure, 1 1-8 cwt. of nitrate of soda, 7-8 cwt. of sulphate of ammonia, 3 cwt. of superphosphate, and 1 cwt. of muriate of potash is suggested for use.

THE CHAYOTE.

It is stated that within the past two or three years this vegetable has become recognized by the general public in Queensland, Australia, as an excellent table vegetable. It thrives remarkably well and is noted as one of the most prolific bearers among the Curcurbitaceae. It is grown in large quantities also for feeding dairy cattle, pigs, and horses. Four hundred fruits have been gathered from a single vine in one season. No disease of any kind has been known to attack the plant in Queensland as yet. It is prepared by cutting the fruit in half, boiling it, and serving with pepper, salt and melted butter.

CULTIVATION OF MUSHROOMS.

The author in a government bulletin, (B. M. Duggar) advocates the tissue method of spawn culture which is described essentially as follows: Test tubes or large mouth bottles are filled with fresh stable manure or with a compost and then sterilized. This material is then inoculated by selecting from a bed of vigorous growing mushrooms a variety which proved unusually prolific. With a sterilized scalpel and forceps, the stem is broken off and the outer skin peeled off. Small bits of the tissue of the mushroom are then taken and used to inoculate the manure in the sterilized bottles.

It has been found that within the course of a week, or sometimes within two days, these bits of tissue will send out a small growth of mycelium which spreads to all parts of the tube or bottle within three or four weeks. This material can then be used as pure culture virgin spawn for inoculating bricks. This method of producing spawn has been found to be commercially practicable, and three varieties of mushrooms named, respectively, Alaska (a white sort), Bohemia (a brown sort), and Columbia (an intermediate or cream-gray sort), have been developed which can be produced true to type.

DEGENERATION OF POTATOES.

A late German bulletin discusses at some length the degeneration of potato varieties as possibly due to continued propagation by means of the tubers, to unfavorable local conditions, and to poor selection of seed tubers. The literature on this subject as well as experiments along this line are reviewed.

The author concludes that in all probability the age of a potato variety is not a factor in its degeneration, but that unsuitable environment, especially a poorly adapted soil and insufficient care in the selection of seed tubers, are strong factors in reducing the vigor of a variety.

* * *

In another bulletin the conclusions drawn are based on the results of numerous experiments by different investigators.

The degeneration of varieties is considered as largely due to cultural and local conditions, while the superiority of new varieties over older sorts is regarded as indicating a greater adaptability to the particular region. Physiological degeneration of a variety is not believed to result from the asexual method of propagation through a series of years.

The fact that certain old varieties in particular localities retain their productiveness, in the opinion of the author would seem to contradict such a conclusion. It is stated that a study of the principal factors of growth, especially climatic conditions in each locality, would throw much needed light upon this subject.

PRUNING TOMATOES.

W. T. Macoun, in Country Gentleman, gives an account of results obtained from pruning tomato plants.

Two varieties of tomatoes were used in the experiment, Sparks Earliana and Matchless.

When the plants had developed 6 strong leaves in the hotbed the tops were nipped off and the plants given more room, being spaced 5.5 inches apart each way. "The object of pinching off the top of the plant was to cause new shoots to develop at the axils of the leaves, in order to have 6 branches bearing early tomatoes instead of one cluster usually found on the top of the plant." These plants were set out in the field June 6th alongside of other plants which were left unpruned. On June 22nd one-half of the pruned plants were pruned again, all laterals being taken out and the 6 main branches only being left. The remaining plants were left to grow at will.

The first ripe fruit on the unpruned plants was secured July 29th, on the plants pruned once August 13th, and on those pruned twice August 12. The heaviest yield of fruit was obtained from the plants pruned twice in the case of Sparks Earliana and pruned once in the case of Matchless. In both cases the pruned plants gave heavier yields than the unpruned plants. The results are thought to be very promising and market gardeners are advised to give this system of pruning a trial.

BERRY PLANTS

Brandywine Strawberries (Kellogg strain), Gray's Gardena Dewberries. First-class plants at low prices.
C. T. STANFIELD, R. F. D. 6, Los Angeles, Cal.

Strawberry Plants

"Saltzer Everbearing," $3.50 per 1000; also Divided Arizonas, $3.50 per 1000.
T. M. Williamson, R. F. D. No. 1, San Diego, Cal.

BRANDYWINE PLANTS

Brandywine Strawberry Plants for sale, Kellogg's strain. No better nor thriftier plants grown. Clean of all disease; at bottom prices.

FARMERS' INSTITUTES.

The following institutes will be held in Los Angeles County at the dates named:

Toluca, January 18th, Burbank, 22d, San Fernando, 24th, Alhambra, 25th, Gardena, 26th.

Prof. W. T. Clarke of the University of California will be present at all these institutes.

Beet Contracts for 1906—The contracts of the beet sugar companies for this year appear to have about all been closed in California, judging from reports received by the newspapers. The schedule of prices as agreed upon indicates an increase to farmers over the prices paid during the past season. The minimum price will be $3.50 per ton, which will be paid for 11 per cent. beets. For each additional percentage of sugar above 11 per cent. there will be paid 25 cents per ton additional up to and including 15 per cent., making 15 per cent. beets pay $4.50 per ton. Above 15 per cent. for each additional per cent. of sugar 30 cents per ton will be paid. On this schedule 16 per cent. beets will pay $4.80 per ton; 17 per cent., $5.10; 18 per cent., $5.40; 19 per cent., $5.70, etc. It is estimated on the percentage of the past years that this will be an average increase of 35 cents a ton on all beets raised for this factory. It will be noticed that this puts a premium especially on beets of high quality, although it makes a minimum of 11 per cent. instead of 10 as heretofore. These contracts, if they are correctly reported, ought to result in increasing the acreage of beets.

It has been noticed that farmers have been giving more attention to the subject of beet culture of late, prompted thereby by the disposition shown by the sugar factories to pay better prices. There are sections in California where too much alkali does not appear, where beets will bring a better return than any other crop. Farmers will do well to consider these conditions carefully for the sugar beet demand is growing.

* * *

Knockers at Work—The cold wave which passed over California, recently, has given the unscrupulous fruit buyers their golden opportunity to go before the growers and represent, as they have done in years past, that fruit has been injured seriously and the best thing the orchardist can do is to sell his crop now, using their agency as a medium to dispose of his stock.

The Cultivator's advice to citrus growers is to pay no attention to these representations. Fruit has not been hurt to any serious extent, as yet, and the prospect is, that the prices are going to remain where they have been for the past few months.

Careful investigation by honest, competent inspectors does not reveal any such condition of injury to fruit as was at first reported, of course some fruit has been nipped, but the great bulk has not suffered to any particular degree. The trees generally, appear to have been in good condition to resist attack by frost, and although the thermometer did go low enough to have done damage, the trees withstood the cold. It may be said in this connection that authorities hold that the thermometer gauge does not always indicate damage to trees and fruit, for while it may show cold enough to nip fruit, if the trees are healthy and vigorous they will stand a lower degree of cold than indicated by the thermometer.

Therefore let the orchardist not grow over anxious, nor dispose of his stock on unfounded, adverse rumors.

* * *

Deep Ploughing.—The Campbell system of dry farming, which so much is written about today, recommends as of the utmost importance to successful results deep and thorough stirring of the ground. The old method of skimming the soil simply does not restore the capillarity of the ground which has been arrested by the plow. Deep plowing and thorough harrowing does this, and here is the secret of Campbell's system. He turns the ground over with a deep plow, harrows it until it is in good condition to plant, leaving it in prime condition to receve additional moisture and retain what has already come into it.

It may well be stated as a general proposition that no soil returns its fullest capacity of good which it neglected in plowing and in harrowing. The corn sates in the middle West demonstrate this. A field which is skimmed and left lumpy will not grow a third as large crops of corn as one that is plowed deep even ploughed twice, and harrowed fine and cultivated often. We know this from practical experience, and the up-to-date farmer knows it and follows the rule of thorough soil preparation before planting.

Some how the idea got abroad in California in the earlier years that deep soil stirring is not necessary to successful farming, but it has been demonstrated that this theory is wrong, and that in a semi-arid country more attention is necessary in putting the ground in proper condition for crops than in the middle west, where the rains are usually abundant and the snow does much to return to the soil the elements which it needs.

We agree with the agricultural editor of the Los Angeles Times that this spring "as usual the soil will be skimmed with a gang plow." It ought to be disemboweled, so to speak, that the sub-soil which has become sodden from long absence of atmospheric influence upon it, may be given the opportunity to recuperate what it needs from the sun and air.

The Cultivator has been talking along this line for years and it is glad to say that increased interest is being manifested by farmers, although the time has not been reached, it seems when this interest is general. We quote here what the agricultural editor of the Times says in his department about deep ploughing.

"The fact that dry-grown crops fail in the arid West occasionally, no matter how thoroughly the plowing may be done, seems a bar to better cultivation among the majority of grain farmers, yet its value has been demonstrated by innumerable trials. For all soils that have underlying fertility should be stirred deeply, only those of inferior subsoil being profited by shallow plowing. The former includes the greater percentage of the grain lands of Southern California. It would be a novelty for some one to begin disking his grain land soon after harvesting, to be followed by deep plowing after the earlier rains."

One of the most useful subjects our farmers' institute conductors can bring up for discussion is this subject of soil cultivation for California crops. We need the most improved methods of farming applied to our soils as much as we do the latest methods of eradicating the pests which attack to our fruit trees.

* * *

Encouraging Outlook.—Just when the farmers were complaining of the absence of rain to complete ploughing for the spring crops and when the orchardists were irrigating night and day in anticipation of a dry season the entire State received a most generous rain which has turned fear to rejoicing and put the ground in fine condition for suspended agricultural pursuits.

Reports from all over the State are to the effect that the rain fall has been abundant for the time being, and that prospects are flattering for another year of prosperity in California. In some sections the rain was almost too heavy for the earth to care for it, all and rivers are swollen and small floods have resulted. But this condition is not general and we ought to be glad it is so.

All the weather prophets have classed 1906 as a year of much rain in this State, and some of them have told of floods which are to come later in the season, but we will not worry about that possibility, it is remote, being thankful that the outlook is bright for another great agricultural year which will bring easy times for the people.

Farmers should, however, make money while the times are auspicious, finish their ploughing and get their crops in as soon as conditions are ripe. By so doing the ground will be in the best of order if ploughed deep, and crops come on rapidly when the warmer days are in evidence.

* * *

Who is to Blame?—There seems to be a very large sized "coon" in the New York orange market, Telegrams sent from there indicate a collusion between certain interests to break down the market and to bring loss to California orchardists by flooding the market with poor and immature and frost bitten fruit. It has been hinted that the Citrus Union is at the bottom of the deal and that it is surreptitiously flooding the market with only one purpose—to break it and to bring disaster to its ancient enemy, the Exchange, and to its patrons, the citrus growers.

This is indignantly denied by the Union, whish says it doesn't have to resort to such tactics because it is doing well enough as things are going. It seems not to be known at present who is at fault, but the ugly rumors afloat point to agencies which put the blame on the "inner circle" of shippers which, it is supposed, belong to some organization which has the entree to the New York market. There is but one thing left for the orchardists of California to do if this matter goes on, and that is to organize a committee, independent of both the Union and Exchange, and investigate all the circumstances surrounding the transaction to the end that the blame may be put where it belongs and the guilty parties exposed. There is nothing to be gained by procrastination, while irreparable injury may be done to the citrus growers if this thing is allowed to go on.

The San Francisco papers report a lively demand for our oranges, but they say there is no demand for poor or different fruit. The Chicago packer tells the same story. One writer says:"It isn't a question of supplying the market with fruit, but it is a question of supplying it with good fruit." He also adds this forceful declaration: "If all graft and benefits were forever wiped out, most of this poor stuff would be kept at home where it belongs. It is more profitable there than it 'is here. Feed it to the hogs! Dump it back on the ground for fertilizer, but do not send it here, paying picking, packing, shipping and selling charges only to have the returns less than the actual value of the fruit on the coast, and everything else a dead loss. It is charged that if some one were not getting something beyond the legitimate profits of the business there would be less eagerness to send the stuff here."

It is in this possible graft where the "coon" is hiding, and he is the dangerous person who must be dragged to light and his scheme exposed. Shippers cannot permit their interests to be jeopardized by the indifference of either of the two organizations which now control the trade in California oranges, and the time to act is in the incipiency of the danger which threatens the citrus industry in this State.

So we say the matter should be probed and the guilty parties exposed, no matter what organization is behind them, if indeed there be one.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Some of the best peaches in the State are grown at Healdsburg.

In the vicinity of Sebastopol are the largest berry fields in the State.

A winter melon is the latest member of California's kaleidoscopic procession of fruits.

T. B. Fredendall bought the 13 acre orange grove of Percy Chinn last week. The consideration is said to have been $15,000.—San Dimas Eagle, January 4.

The orange crop in Marysville this season is large and of good quality, but the fruit is small. For some unexplained reason the oranges in many instances are not more than one-third the size they should be and usually are.

The Salinas Index says: Over 31,000 fruit trees, comprising Bellefleur apples, Newtown Pippins, and Winter Nellis pears, have been ordered for the Clark colony, in addition to ornamental trees in large numbers, for Greenfield.

The Hamilton-Burns Company, of Los Angeles, has purchased 200 acres of land at Nutwood station on the Southern Pacific near Anaheim, at a stated price of $100 an acre, and will set the entire tract to walnuts, oranges and alfalfa.

It is expected that the Mercantile Company which bought all the Association grapes from the Fresno owners are preparing to rush the goods east as fast as possible, and the S. P. is preparing to handle 1000 cars of the goods at once.

The Board of Supervisors of Tulare County will "stand pat" upon the county ordinance prohibiting the importation of rooted vines and cuttings into the county, and the Board of Horticultural Commissioners will see to it that the ordinance is enforced.

The shortage in the orange crop in Monrovia and parts of Duarte has not been increased by damage from frost. The desultory bloom on the orange trees is the best evidence that frost has not touched them. Lemon trees also are budding. In Duarte a little of the new foliage was injured in the lower groves, but the fruit escaped, so far as known.

This year's shipments of citrus fruits from Southern California have totalled to January 4340 cars, of which 3720 cars were oranges and 620 cars were lemons. Last year's season's figures were 3764 cars of oranges and 323 cars of lemons, a total of 4007 cars. The excess of the season 1905-6 over 1904-5 to date is 333 cars, of which 46 are oranges and 297 are lemons.

AGRICULTURE.

The Empire Asparagus Company started this week to plant 500 acres of land near Terminus, to asparagus.

The Placentia Orange Growers Association shipped three carloads of oranges last weeek, says the Fullerton News.

About 500 acres of land will be cultivated to sugar beets in the vicinity of Orosi and Sultana this season, for the Visalia sugar factory.

A sufficient sugar beet acreage has been promised about Orosi and Sultana to justify the establishment of a dumping station of the Pacific Sugar Company at that place.

Less hay than usual is being sown in the foothills this year around Salinas, and more orchards are being set out. In all probability not enough hay will be raised for local use.

Farmers' institutes will be held at Toluca January 18, Burbank the 22d, Fernando the 23d and Alhambra the 24th. Prof. W. T. Clark of Berkeley, will be present at each of them.

The Coachella valley where many farmers have located and are prospering from the wonderful productions of the richest soil in the state, are watching with trembling and fear the daily encroachment of the mysterious waters.

Senator Perkins has suggested to Secretary of Agriculture Wilson that he recommend to Congress the necessity of giving aid and encouragement to the hop growers of Southern California. Wilson promised to make a recommendation.

Reports come from Washington that the beet sugar interests are proposing to heap troubles on the head of Congressman Needham because he gave the casting vote in the Ways and Means committee in favor of the new Philippine tariff bill.

The alfalfa thresher has been through the neighborhood around Silsby lately, and all the farmers who had alfalfa threshed averaged more than 200 pounds of seed per acre, whch at 12½ cents per pound makes $25 per acre just for one crop.

In the vicinity of Santa Rosa and along Russian River there are hundreds of acres devoted to hops, the crop this season amountng to 24,000 bales. Here also are the splendid prune orchards which have brought Sonoma county into prominence.

Thermal and Coacehlla cantaloupe growers have agreed to employ jointly distributing agents for all western markets in instances where this can conveniently be done. In this manner each association will know how many cars are distributed each day and at what points. The secretary and manager of each association constitute permanent committee for joint distribution of cars.

LIVE STOCK.

That California professor who is working out a system for making hens lay the year round should get out a patent for perpetual motion.

A number of ranchmen and cattlemen at San Dimas, owning an excellent well and pumping plant, have incorporated as the Johnstone-Rutherford Well Company, with a capital stock of $20,000 fully subscribed.

Warren D. Gale, a young rancher who came to Claremont three years ago, and conceived the idea of building up a substantial business in the thoroughbred Angora goat industry, starting out on a small scale and adding to his herds as the opportunity offered to procure valuable animals.

How well he has succeded is shown by the fact that from his early start of a dozen goats, he now has nearly five hundred grazing on the plains and foothills of the ranch, and his sales of wool for the year will amount to several hundred dollars, while he has nearly three times as much demand for kids and milk goats as he can supply.—San Bernardino Index.

MISCELLANEOUS.

Santa Rosa has voted $200,000 for municipal improvements.

New Year's Day was the coldest in the history of Elsinore, says the Elsinore Press.

The Visalia Morning Courier is making a righteous war against gambling in that city.

A wireless telegraph station to cost $40,000 is to be established by the government at Point Loma.

The local gas company has made a cut in price of gas furnished to Oxnard from $1.50 per thousand to $1.25.

Sierra Madre is the latest Southern California town to be connected up with the Huntington trolley system.

It is estimated that in all parts of Los Angeles county there were erected during 1905, buildings aggregating in value $9,848,282.

The number and value of building permits at San Diego were much greater during the past year than ever before. The aggregate was $1,193,170.

Unless the flow into the Salton basin is checked, the little town of Mecca will be under one hundred feeet of water in the near future.—Ontario Record.

Alhambra is now making more rapid progress in population and public and private improvement, than any similar place in the county, so the Advocate declares.

Santa Ana merchants have been giving some unanimous testimony on the marked increase of business since the completion of the electric line into that thriving up-to-date city.

Secretary Taft has recommended to the President that he sanction the issue of a revocable license to the Union Oil Company of California to construct and maintain a pipe line across the canal zone.

A correspondent from Ventura says there is a boom in cement claims and rock in that county, and a prospect that before many months large sums of money will be invested in the cement industry.

The Bakersfield Californian reports that an oil boom has struck the extreme northeastern corner of Kern county in the Freeman Peak mining district, and claims covering some 5000 acres have beeen located.

The Huntington Beach Board of Trade has made a prize for the best kept yard and lawn for the coming year, from $25 to $50 for first prize, and made the other prizes $35 for second and $15 for third.

Santa Paula has seen several enterprises inaugurated during the old year says the Press, which will bring her good in years to come. Notable among these is the establishment of a new bank there, with solid citizens behind it.

A committee of citizens waited on the Santa Fe officials in Fresno a few days ago and presented a petition signed by 150 persons, asking that a station be established at the switch about a mile and three-quarters north of Dinuba.

Plans are being prepared under the order of the Board of Supervisors at Bakersfield for the construction of a modern ten-room high school building with a capacity of 400 pupils, and the plans will be formally adopted at the next meeting of the Board of Supervisors. The school building will cost $50,000.

More than 1,000,000,000 herrings were packed in tin cans as domestic sardines in 1905, the first time in the history of the Maine sardine industry that the figure has been reached. The value of the little fish in cans this year exceeds $5,000,000, making the industry one of the most important in the Pine Tree State.

Climate and Crops

U. S. Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, January 15.

The weather was slightly warmer than during the preceding week, but frosts were frequent at the beginning of the week. Generous rains fell in all sections, with heavy rain in the foothill and mountain districts. The warm rains in the mountains caused rapid melting of the snow and the two combined resulted in a rapid rise of rivers in the Sacramento valley, but no damage has yet been done by overflow.

The warm rains were specially valuable in the central and northern portions of the State, where farm work was very backward. Plowing and seeding have been resumed and it is probable the grain acreage will be nearly up to average. Early grain and grass were greatly benefited and are now making good growth. Feed is still scarce in most places and stock are in poor condition, but there will be rapid improvement if warm weather continues. The rainfall is still considerably less than at this date last year except in Southern California, but if the usual conditions prevail through the remainder of the season there will probably be average crops.

Orchards and vineyards are in excellent condition and were also benefited by the rain. It is reported that the recent frosts caused no great damage to citrus fruits in Southern California, but celery and other tender vegetation suffered considerably. Orange harvest is in progress in the south; the yield is very good, but the fruit is smaller than usual.

CURE FOR RATTLESNAKE BITE

Pound up alum, put into cold water, make the solution very strong with alum; bathe the wound constantly until the swelling is all gone, which will be in twenty or thirty minutes; if bitten after breakfast will be ready for dinner. I have done some wonderful snake cures with this solution.—Mrs. Sarah Timothy in S. F. Examiner.

LINERS

FROST PREVENTION—FOR SALE AT half price, 400 Froude Patent Oil Fire Pots in good condition, used only once, part of them not at all. No further use for them. Also Electric Alarm Thermometer and fixtures. C. H. LOCKWOOD, Burbank, Cal.

FOR SALE—120 ACRES NEAR WOODBINE, Iowa. Good ground and improvements. Price $80 per acre. Will exchange for California land. Write to owner, L. B. Lauridsen, Woodbine, Iowa.

WALNUT TREES FOR SALE.—I HAVE 8000 2-year Santa Barbara Soft Shells which I will dispose of at the very lowest price. A. J. HIXSON, Burbank, Cal.

WANTED—ONE THOROUGHBRED Grey Brahma Rooster. MRS. J. F. MOORE, R. F. D. No, 2, Norwalk, Cal.

STANDARD-BRED BUFF ORPINGTON Eggs, $2.00 and $3.00. Fertility guaranteed. N. Hayden, Altadena, Cal.

Live Stock and the Dairy

SPAYING HEIFERS.

"I am often asked at what age it is best to spay heifers." I think the same rule applies here as with castrating males, and that it, the younger the animal is when the operation is performed the better. Heifers spayed when quite young develop masculine characteristics and often at four years of age I have seen them look like steers. If the operation is not performed when they are calves the next best age is when they are yearlings. After that age I do not consider it an advantage to spay, so for as growth and development are concerned. The only advantage that comes from it then is to prevent breeding.

A well bred heifer calf spayed when young by a competent operator is as nice to handle, as easy to keep, matures as early and makes as fine beef as a steer of the same breeding and age. The only real difference is the lighter bone. It would have delighted many of the readers of this paper to have seen some of the heifers that were shipped out of Bellefourche, S. D., this last season. They were three quarter grade Shorthorn heifers which I spayed as heifers. They ran on the range here until three years old and passed, and when started for market made as nice a bunch of stuff as you often find. If they could only have gone into a good Iowa field for a ninety day finish on corn they would have made market toppers.

I am often asked what the loss from spaying is. I estimate 2 per cent. but I believe I can safely say that I have never seen that rate reached for many years. In my own practice I use every precaution to prevent blood poisoning by thoroughly disinfecting every instrument used and by having the animal put in the best of condition for the operation. Several years ago it was found that nearly all of the heifers spayed would come in heat. This was simply because the operation had not been properly performed. There are too many incompetent operators who can go through the form of the operation, and there is no means by which one can determine whether it has been improperly done until the heifers begin to come in heat and later drop calves."—Geo. M. Clay.

MILKING MACHINE

At Stockton a new milking machine has been invented which is now in use on several dairy farms, and the outcome of its operation is being watched with much interest by dairymen. The Fresno Republican recently in telling about this machine, says, "it will probabaly meet with no better success than its predecessors." The Republican will be surprised should this device turn out a happy solution of the milking problem. If it shall do this it will be hailed by all dairymen with delight. It will solve the labor difficulty against which the dairy business today meets with most of its difficulties. The Republican says, "to raise grass and ensilage, in the East, or alfalfa in the West, and feed them to cows, is simple, but to milk those cows requires men willing to do the work, and they are scarce. Labor difficulty is the only serious problem of the dairy business, and the only obstacle is its indefinite expansion, especially in favored regions like the San Joaquin valley. If a machine could do the work everything else would be simple. And if the cow herself were a machine, no doubt somebody could devise another machine to extract the milk from her. But lactation is quite as much a mental and emotional as it is a physical process. Everybody knows that cows "hold up their milk" from an unwelcome or incapable milker. As a matter of fact they do not hold up their milk, but they simply fail to secrete it. As the mouth waters at the sight of luscious food, so the cow's milk glands pour forth their secretion in response to the accustomed stimulus. When the milking begins, the udder is by no means a mere passive vessel, full of milk. It is an active, living organ, containing some milk, and ripe to produce more in the milking process. A machine can extract the milk, but it is difficult to conceive of a machine that would hyptnoize a cow into the mental and emotional state necessary to "give down" her milk. The cow has a soul after all, and until we can devise a machine with a bovine degree of soul, milking by machinery is liable to fail."

.GAIT OF THE DRAFT HORSE..

The normal gait of the draft horse is a walk. He was not made to trot or run. It is important, however, that he acquire when he is first broken the habit of walking lively and walking slowly when a slow gait is required.

The gait is largely a matter of inheritance, and the draft stallion or mare that can walk briskly should be in all cases preferred to one that moves off as though it had all the time there was in which to go a short distance.

Much, however, depends upon the trainer. Most farmers when they break colts put them alongside some steady-going old mare, a regular "loitermobile," which may be all right to start with, but as soon as the colt moves off himself, let him acquire a brisk walk, as though the time was too short for him to do the allotted work. While for plowing heavy sod a slow steady gait is inevitable, and for plowing corn for the first time preferable, in almost every kind of farm work a beter job will be done by a team that knows how to step briskly.

The training of a draft horse is a comparatively simple matter, and yet it is of very great imoprtance to so train horses that they will normally move briskly, and at the same time adopt a slow steady gait when the necessities of the work on hand require it.

IT'S A POOR RULE A COW CAN'T BREAK.

A teacher was giving her class a lesson in substraction. "Now, in order to substract," she said, "things have always to be of the same denomination. For instance, we could not take three apples from four pears, nor six horses from nine dogs." A hand went up in the back part of the room. "Teacher," shouted a small boy, "can't you take four quarts of milk from three cows."

The thing is altogether practicable to supply water to the arid lands of the West. They could be made to sustain a population that would add greatly to the wealth of the country.

24 YEARS WEAR NO REPAIRS

SEPARATOR FACTS

43 YEARS WEAR 75¢ REPAIRS

Just facts—that's all you want. Facts can't hurt you nor Tubular Cream Separators. Facts prove Tubulars outwear all other makes five to ten times over.

On August 2d, 1904, we started a No. 9 hand driven Dairy Tubular, rated capacity 900 lbs. per hour, on the hardest test a separator was ever put to—an endurance test to last until the wearing parts give way. This Tubular has now run 50 hours a week for 43 weeks—and is still running. Every week of this test is equal to a year's service in a ten cow dairy. No other separator made could stand such a test.

24 Years' Work—No Repairs	
Hours run	1,200
Pounds separated	1,080,000
Turns of crank	3,155,760
Turns of bowl	1,152,000,000
Oil used	8 quarts
Time oiling	About 4 min.
Time adjusting	None
Repairs	None

43 Years' Work—75c Repairs	
Hours run	2,150
Pounds separated	1,935,000
Turns of crank	5,652,070
Turns of bowl	1,864,000,000
Oil used	5⅜ quarts
Time oiling	About 7 min.
Time adjusting	10 min.
Repairs	75 cents

After 24 weeks, the balls in the frictionless bearing supporting the bowl showed wear. This was natural, for each had rolled over 32,000 miles. Renewing balls cost only 75 cents and ten minutes adjusting, yet made this Tubular as good as new. All Tubulars are equally durable. Catalogue P-260 tells about them. Write for it today.

¼ TO ½ BUTTER LOST THIS WAY

WHICH?

NO BUTTER LOST THIS WAY

Which way do you skim your milk? It is hard sometimes to realize just how great the loss of cream is with crocks and pans. Some people may not believe that a

U. S. CREAM SEPARATOR

skims enough closer than the old way to increase their butter yield one-fourth or more. But it does. Users say so. Here's an every-day example—

"ALTURAS, CAL., Sept. 1, 1905.

"The U. S. Separator beats them all for ease of handling and clean skimming. When we got the No. 7 we were making 40 lbs. of butter per week with pans. The first week that we run the Separator we made 60 lbs. and with less work.—KELLY BROS."

DE LAVAL DAIRY SUPPLY CO.

9 and 11 Drumm St., San Francisco 107 First St., Portland 112 2nd Ave. South, Seattle

Raising mules for the market is one of the most profitable things the Northern California stockman can engage in. The market shows conclusively that good-sized mules pay a good profit. Last week's St. Louis market report shows that the bulk of sale of mules 15 1-2 hands high were from $110 to $135 each, and those of 16 hands sold for $140 and $165, the toppers of the market bringing $210. Mares that are not adapted to mating with the very heavy draft stallions will bring good mules, if a large-sized jack is used.

SECURITY

Stock Food

is sold on the honest plan of satisfaction or no cost. This is a straightforward plain talk and means just what it says.

Use **Security Stock Food** (glutenized) for growing animals; for fattening animals; for work horses; for milch cows. The Food won't cost you a cent if you can't see that **Security Stock Food** has saved feed, made quicker growth; kept your animals in better condition, given more milk, and made you more money. Write us if not satisfied and we will refund price in full. You are the sole judge. No questions asked.

For five years this guarantee has been on every package sold. It also covers Security Poultry Food, Lice Killer, Gall Cure, Colic Cure, Worm Powder, Calf Food, Heave Remedy, Healer and Rheumatic Liniment. Security preparations are sold by dealers in almost every town in the United States, who will recommend them highly and "back up" our guarantee.

SECURITY IS THE ONLY GLUTENIZED STOCK FOOD.

VASELINE IN MILKING.

An Australian dairyman, who has a remarkable record for milk that keeps sweet, gives the following method of milking:

How do we do this? You may inquire. Not by any red tape, white suit covered pail or dry teat milking. We conduct too large an establishment to waste time or money in gingerbread extras.

When a dairyman tells me he practices dry-teat milking, I know that he either does not milk cows himself or does not state facts. It is physically impossible to milk any herd of cows and keep their teats dry. There are a few cows in every herd that can be milked with dry teats, but they are the exceptions.

I visited a dairy herd some time ago that advertised in a neat booklet that they milk with dry hands. The proprietor of this herd is a stickler in his methods, but all the same I saw his men wipe their hands on their overall legs repeatedly to keep them dry when milking short-teated cows.

We take a small amount of vaseline on the fingers of the right had, sit down to the cow, and with the left hand brush off her flanks and udder, then annoint the teats, and after the teats are lubricated, rub both teats and udder with the palm of the hand.

This fixes any dust or bacteria that might drop off during milking, and the ease of milking will astonish anyone who has not tried this method and the most surprised party will be the cow herself, if she chances to belong to a dry-teat advocate.

LONG DAIRY TESTS.

"A well-known dairy paper declares that weekly tests of cows are misleading, and calls on the breeders and the press to take steps to put a stop to them. It is true that a week's test is not a criterion of the cow's value in a dairy herd, but it is also true that it is a great deal better than no test at all. A year's test is made only with a greater outlay of time, labor and money than most men can afford. If made with a view of making a high record for the cow there is danger of injuring her. Many breeders can not take the trouble and risk of such a long test when they can by a shorter one ascertain to some extent the cow's capacity. All of them can keep a yearly record, but keeping a record of a cow's work and making a test are very different things. We favor more long tests if they can be made without injury to the cow which is doubtful. And we favor more short tests because they are very useful to determine the capacity of a cow for the time under test, which is clearly stated and no one is deceived. As to all tests it has been proved that the high feeding necessary to greatest yields does not pay; a cow may be feed too much for present and subsequent profit. Hence it is out of the question to make them in connection with everyday dairy work."

The Jersey Bulletin in commenting on the above says: "Any steps taken to stop weekly tests (or any other kind of tests) would meet with complete failure. It would be more "Frenzied Dairy Science."

CONSIDER THE BOY.

"Every father will do well to give his boy a piece of land to cultivate with the understanding that the returns shall be the boy's own, if he cultivates it well. Many a fine boy has left home and been ruined, simply because his hard-fisted father would not let him have something to call his own."

DEHORNING CATTLE.

Professor Spellman of the Agricultural Department declares that it is possible to dehorn a whole breed of cattle by introducing into the herd a single pure polled animal, although this would require more inbreeding than is desirable. The problem is much more easier when a number of breeders work in parallel lines so that strains are always available that are not so closely related. The only difficulty in applying the principles of Mendel's law in dehorning a breed of cattle arise from the fact that the hybrid animal is itself polled, although it is capable of transmitting both the polled character and the horned character to its offspring.

The general principle to be used as a working basis is the important fact that when a number of crosses are secured between the polled and horned animals and these crosses themselves are crossed, one-fourth of the progeny will be pure polled animals incapable of transmitting horns to their progeny and these pure polled animals are to be used as a basis upon which to build a pure polled breed.

It is entirely practicable for every breeder to secure enough of these pure polled animals as a basis upon which to gradually work out the horned animals, and increase the pure poll until they constitute his whole herd.

WHAT IS THE BEST BREED OF SHEEP?

The question of the best breeds of any of our domestic animals is one that never will be settled. Generally the best breed for anyone is the breed he likes best, for in that he will take the most pride, give it the best care, and hence it will do the best.

None of our domestic animals admit of so great a variety as the sheep and none is susceptible of improvement in any given direction more readily. It is remarkable how quickly they respond to skillful breeding. The weight of the fleece can be doubled with a few crosses of the Spanish Merino with the native light-shearing, open-wool breeds, and the weight of the carcass greatly increased by the use of the heavy mutton breeds with the smaller framed Merinos.

The "best breed" depends very much on locality and other conditions. On cheap, rather tough land not well adapted to cultivation no breed will do better or give better returns than the Merinos. They are hardy, far less liable to disease and shear much more wool than the open-wool breeds. So many times I have known men to change from Merinos to some of the mutton breeds always to regret it in the end.

I have known men to introduce a coarse ram into their flocks of good Merinos and after a few years be glad to get back to a flock that had no infusion of coarse blood.

The first cross is the only one that gives anything like satisfaction. After that detioration seems to set in at a rapid pace. The ticks are at home with the coarse wools. It seems impossible to get rid of them and to keep entirely clear of them. I have offered my shearers a $1 a piece for all the ticks they found on my Merinos, and never yet had to pay out any dollars in that direction, but some twelve years ago when I began to raise a Shropshire ram and began to raise mutton lambs I got plenty of ticks and in spite of the most thorough treatment was unable to keep entirely clear of them while breeding in this direction.

A few years ago a friend of mine paid a great price for a small flock of one of the mutton breeds. My neighbor and I bought ram lambs of him at different times and not one of them lived to be three years old and two of them died at the age of eighteen months. The flock became so diseased that my friend sold out and quit the business entirely, and he said to me "The next flock of sheep I own will be one of the Merino family."

Another friend of mine, who has kept a large flock of coarse wools for a number of years, said to me, "I am drifting back to the Merinos. So many of my sheep die young. I lose a number every year without any apparent cause. At four years they seem like old sheep.

Where conditions are favorable and one wants to keep a large flock, there is no breed that pays so well as the Merinos; but where one only wants to keep a few, and mutton lambs are to be a specialty, the coarse wools are all right. I have in mind now a man who always keeps twenty ewes. He has his lambs come in February and sells them in June or July. Makes them weigh from sixty to seventy-five pounds each, and gets a good remunerative price for them.—E. P. Snyder.

Notes of Poultry Show

The first show of the Breeders Society of Southern California ended in a long needed and glorious rain which left most inglorious looking birds and exhibits. The tents were delightful till the rain became heavier, when they leaked. Every effort was made to protect the birds with good success, and it is to be hoped that all the valuable biddies reached home in the pink of condition.

Some which were in coops decorated with red calico certainly did, for the dripping from the cheap red prints stained some of the whites to a handsome pink and the announcement was made that "Pink Dottes" and "Pink Rocks" were the newest.

However, the rain was not sufficient during the show to seriously interfere and good attendance prevailed to the end.

Financially it was a success and the treasury looks good. It contains between $1000 and $1500 above all expense. Backers of the "guarantee fund" are not worrying.

Mrs. Rhoda E. Durfee of Santa Ana made a fine showing of fine White Rocks. Mrs. Durfee is one of the conscientious breeders of strong constitutioned birds which are at the same time prize winners. Mrs. Durfee's entire time and personal effort are given to her poultry.

The Judges, Messers. Tyler, Butler, Hogue and Thomas gave general satisfaction and all said that they felt that most conscientious work was done.

Ed. Hart came down from Clements, up near Sacramento, with a great showing of Bronze turkeys. His first premium tom also won the Poultry Breeder's cup for finest single bird of any breed in the show. It is a beauty. Mr. Hart is a pioneer turkey breeder, having followed the business for 27 years.

Geo. H Randall of Santa Ana exhibited some beautiful W. C. Black Polish also Buff Leghorns. Mr. Randall has extended yards at Santa Ana where his White Leghorns are the standby. His love of the fancy and pure blood impel's him to breed more than the one variety and he won a number of premiums on his entries. We hope to speak of his yards some day.

Mrs. F. T. Hungerford did things with her Indian Runner ducks. 1st old drake; 1st and 2nd old duck, also same on young duck and young drake and 1st on pen. On W. Wyandottes, on four entries, she took 2nd and 3rd pen; also three firsts and a second on W. Minorcas.

Mr. Brubaker of Hemet Poultry Yards made his first exhibit and won some ribbons. He handles Brown Leghorns, W. Wyandottes, W. Leghorns and Houdans.

W. M. Humphreys did great work with his exhibit. He won the Times trophy for finest exhibit of any breed, three silver cups also twenty out of a possible twenty-three regular premiums. Mr. Humphreys is a consientious and careful breeder of the Rocks and his winnings are only an indication of that care.

Mrs. T. R. Griffith won favor and premiums with her Blues (and andalusians). She has an ideal which she has maintained till the Griffith strain is becoming recognized.

Mrs. E. L. Cowan of Santa Ana was in the winning class with her R. I. Reds. And Mrs. Cowan was on hand to give information regarding her birds and yards.

The way the crowds rolled in, even though the rain was a surprise to all, especially the management. California has a liking for blooded stock, and it believes in supporting these shows of such stock.

The Blue Ridge Blues were in fine feather and were winners. Mr. Brown says his stock is better than ever as producers and certainly they are in fine feather.

The Mission View Poultry Ranch had one of the longest rows of coops and its decorations were most attractive and dainty. The Mission idea was carried out, even to the bells, and the delicate effect of the crepe paper festoons won almost as many favorable remarks as her White Wyandottes won premiums. Mrs. Hubbard won the White Wyandotte Club Cup.

H. M. Stiles of San Diego entered his White Rocks and carried home some ribbons. Mr. Stiles is secretary of the San Diego Association and one of the enthusiastic breeders of the lower country.

And there were others, yes lots of them. But it can all be appreciated only by those who saw it—and the members who feel good over the big cash balance.

MONEY IN TURKEYS.

Here is a story of poultry profits that will be hard to equal; A year ago Christmas T. J. Elliott of Winters attended a turkey raffle at which he won two hen turkeys. He then bought a gobbler and took the three home to his wife as a Christmas present. Mrs. Elliott turned the turkeys into the orchard and took good care of them the ensuing twelve months. Tuesday she presented her husband $100, even, as the net result of turkeys she had sold from the increase of the original three. Having plenty of room and an alfalfa field for the birds to run, the keeping of them cost nothing, but the incident shows something of the possibilities of a too much neglected industry.—Sacramento Bee.

S. C. Rhode Island Reds

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

PROMOTION OF THE CALIFORNIA POULTRY INTEREST.

Before we can properly consider how best to promote the poultry industry in California, we must make a survey of its present condition. The annual product of poultry and eggs for California, according to the last census, is upwards of 96,000,000, at the same itme the importation of eggs amounts to 17,537, 820 pounds, valued at between $2,000,000 and $3,000,000. Here we have one striking fact which shows that there is room for expansion to supply our home markets, to say nothing of exportation.: But the annual amount of eggs and poultry produced does not show on the face of it whether or not it has been a profitable enterprise for the producer. Are our poultrymen prosperous? There are in this State a number of persons engaged in poultry husbandry, who have been thoroughly successful, whether it be from the standpoint of the business man or from the farmer's point of view. Much credit is due to these people, as in most cases they have no example to follow, but have had to educate themselves. It is owing to their energy, industry and perseverance that we are enabled to enjoy the highly creditable and instructive poultry shows annually held in different parts of California. But a very few days' travel and brief investigation would disclose the fact that there are a large number of men who are attempting to raise poultry for profit in anything but a rational manner. Some of these men desire help, some are ignorant of the fact that assistance can be had, and again there are those who do not care to receive any aid at all.

* * *

The poor method and practices which one meets with are due to some extent to lack of sufficient co-operation of science and practice. There has been very little scientific attention paid to the hen as compared with the study which has been carried on with the cow, horse, or hog and considering the great importance of the poultry industry it is not right that this should be so. The value of the poultry and egg product for the United States, exceeds $300,000,000 annually, which is about three fifths of the value of the dairy products and not much below the valuation of the cotton crop. Does the poultry industry receive proportionately the scientific attention from the State Experiment Stations of the United States?

In California the relative position of poultry products, in 1900, is shown in the following statement:

Wheat, 20,179,044; hay and forage, $19,436,398; orchard produce, $14,526,786; animals sold, $13,305,165; dairy products, $12,128,471; barley, $10,645,723; tropical fruits, $7,219,082; poultry and eggs, $6,356,746; grapes, 5,622.825.

* * *

For investigations, relating to viticulture, the last legislature appropriated $10,000 while only $4,000 was similarly apportioned for experiments with poultry. It is true that some of the Eastern Agricultural Experiment Stations are devoting time and attention to the improvement of methods and the betterment of the poultry interests in their respective localities. But our conditions are so different from those met with by our Eastern brothers that we in California can not follow the roads travelled by them but must blaze a trail for ourselves. There has been considerable advance and progress made along this line as shown by the papers read and discussed at the meetings of various county poultry associations, and by the excellent poultry journals published in our State. But there still is room for improvement in many, by far too many, instances. It would be far better to describe what a typical poultry farm for California should be than to describe a typical California poultry farm.

* * *

It would be impossible, within the time allotted to me, to thoroughly discuss this phase of the question—suffice to say that the plan generally practiced, that is, the colony plan, does not, nor will it ever, conduce to systematic and highly progressive poultry culture. Such an end can ouly be attained by the intensive plan and statistics fully bear out this statement.

* * *

The legislature of 1902-3 realizing the necessity for proper experimentation looking towards the improvement of conditions among poultrymen appropriated a small sum for the establishment of a poultry experiment station at Petaluma. At this station the question of breeding, feeding, and treatment of diseases are taken up and two very valuable bulletins on fowl cholera and fowl tuberculosis have been issued as the result of some of the work of the California Poultry Experiment Station.

Among the lines of experiments under way is a practical illustration of the intensive system of poultry husbandry. But owing to the smallness of the appropriation, and also because of the uncertainty of its renewal, the ideal system sould not be carried out. We intend to establish such a plant, in the near future, on the University Farm and prove to those interested the advisability and economy of conducting the poultry business along such lines.

In carrying out scientific investigations the workers must be actuated by two motives—they must not only look toward helping the poultrymen, but bear in mind that it is their duty to be of as much assistance as possible to the consumer. It would be far more to the advantage of the poultrymen to have a more constant production of eggs at a more moderate price than a few eggs at an exorbitant rate at one time and a surplus at low prices at other seasons. It certainly would not be just to teach the producer how to get rich at the expense of the consumer. It is far more equitable to try to so regulate hatching and raising young stock so that the price of eggs may not be, as at present, almost prohibitive for many who require eggs as part of their diet.

The fact that eggs are sold by the dozen and not by weight is an obstacle to progressive work among a large number of producers. There is no incentive to the production of large eggs. It has been stated by some that the selling of eggs by weight would cause trouble in the

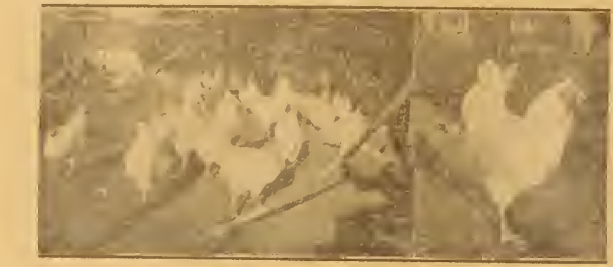
retail trade in making change. To a certain extent this would be so, but a step in the right direction would be to make a minimum standard, i. e., require all eggs to weigh at least two ounces, or twenty-four ounces per dozen. Had such a law been in operation during the current season there would have been many dozens of eggs in Berkeley sold at 60 cents, subject to discount.



Pedigreed White Rocks

These are a few of the problems which are necessary to be solved in order to promote the poultry business and at the Station in Petaluma and in the laboratory at Berkeley we are doing our best to accomplish this end. Much of the successful outcome of the experiments will help the poultrymen and thus promote the industry, the greatest good must be expected from organization and co-operation among the poultrymen for better and more systematic work, both as regards feeding, breeding and general management. Until those interested do organize and cooperate it will be almost impossible to put into operation a food inspection law for the guidance and protection of the feeder. Were we exercising such a law at present there would not be on sale the large number of proprietary foods selling at high prices, far beyond their food value or for sale for the feeding of the horse, cow or swine, for the reason that the advice and conclusions of agricultural experiment stations, resulting from careful scientific studies, show that the feeder can obtain the best results without the use of proprietary or condimental foods.

It would appear that, when similar extended investigations for poultry shall have been carried out, there will not be the showing as at present, by the manufacture of the foods in question. Not only is a food inspection law necessary with reference to proprietary foods, but also in connection with the sale of the ordinary cattle and poultry foods, such as the alfalfa meal, clover meal, bran, etc. It can be truly said that alfalfa is a most valuable food for poultry and therefore alfalfa meal when made from the first quality alfalfa hay, is a highly desirable product. But on the other hand, when we find material labeled such that one would infer that its origin was the best alfalfa hay, showing, upon chemical examination, less than 13 per cent. protein, it is far from being what a poultryman requires and at same time costs far more than the nutritive value warrants. It certainly would be to the decided interest and benefit of both consumer and producer, if the pernicious practice said to be in vogue by some dealers of placing store eggs in the same case with fresh laid eggs and selling the whole as fresh eggs might be prohibited. A food inspection law, properly exercised, would soon prevent such impositions. These are just two instances emphazing the urgency of the passage of the law already referred to.

* * *

During the last year a large number of requests for advice have been received at the station from poultrymen who have had difficulties with their flocks, arising from either improper feeding, or from a lack of knowledge necessary for the successful raising of young chicks. These appeals have been so numerous that they confirm the opinion of the writer in that one of the means of promoting the poul-

try interests of this state would be to have a competent officer of the University who would, in person, answer these calls for aid and instruct the party along the necessary lines. These visits would entail no traveling expenses on the University other than the railroad fare, which doubtless would be nominal as we have every reason to believe that the railroads in California would only too gladly cooperate in any such scheme. The party requesting the aid of such an officer would be asked to furnish his accommodation while in the locality. Similar plans, with reference to dairying have been successfully carried out in Denmark. people being only too glad to take advantage of State aid and the results of visits have exceeded the expectations of the most sanguine. Why should not California do as much for her poultrymen as Denmark does for her buttermakers?

It has already been said in this paper that the purpose of scientfic promotion of the poultry interest is to help both the producer and the consumer, and while it would appear that the main lines of work is along the education of the producer; still there are some prejudices on the part of the consumer which prove the necessity of his further enlightenment in certain directions. One of these is the objection to brown-shelled eggs and therefore it would seem timely to enter a plea for the Plymouth Rock and all fowls laying brown-shelled eggs. If there were any difference in size, in weight, or in nutriment between the brown-shelled and the white shelled eggs there might be some reason why the price in the California market should be a few cents less per dozen for the brown-shelled eggs.

It has been said by some that the brown-shelled eggs are richer than the white-shelled eggs. This statement, however, is not borne out by a searching chemical analysis and the physical examination proves that the main point of superiority, although extremely slight, are possessed by the white-shelled eggs. The minute differences that are found between the two groups are exceeded by variations between the varieties within the same group.

We can therefore state as a conclusion both from a chemical and physical point of view that there are practically no differences, so far as the food value is concerned, between the white-shelled eggs and the brown-shelled eggs.

In conclusion, let me impress upon each of my listeners that he can individually add his share to the promotion of the poultry industry as a whole. What we need most of all is to accumulate full and accurate statistics upon which to base permanent and reliable conclusions. If a large number of the poultrymen would undertake to keep accurate and careful data in regard to the different methods employed in housing, feeding and general management it would be of inestimable value to those who are making scientific investigations. Science and practice must go hand in hand, and by a thorough cooperation between the poultrymen and the agricultural department, and between the poultrymen in the different parts of the State we might hope for a speedy solution of many of the problems now confronting us.—M. E. Jaffa, University of California.

OFFICE OF
Must Hatch Incubator Co.
(INCORPORATED)
A. E. Bourke, Pres. Phone Black 1211

PETALUMA, CAL., JAN. 1, 1906.

TO WHOM IT MAY CONCERN;

As the chicken raising season is at hand, we beg leave to call your attention to a few of our specialties.

Do you need an Incubator? Our machines are fully guaranteed and have proven themselves unsurpassed wherever used.

Do you need Brooders? We manufacture just what you want; fully guaranteed, made of the finest material and of the best possible workmanship, and, above all, a practical machine which saves the purchaser money, time and labor.

Do you need Poultry Supplies of any kind? We manufacture a line of Supplies the use of which makes Poultry Raising not only profitable, but a pleasure. Among our specialties are:

Our Water Fountains; our Self Feeder for Chicks, our Feed Troughs, large and small; our Lamp Fillers.

Our convenient Must Hatch Nest Boxes; our safe and sure Must Hatch Insecticide, our sanitary Must Hatch Disinfectant, our sure death Must Hatch Lice Exterminator, our Poultry Compound, a fine Spring and Fall Tonic.

In connection with the above list, all of our own manufacture, we can also furnish the following, which are indispensable to the Poultrymen:

The No. 128 Clover Cutter, the Enterprise Bone Mill, the Ohio Feed Cutter, the Banner Root Cutter, the Enterprise Feed Chopper, the Ideal Duplex Feed Mill, and the Farmer's Boiler.

Do you wish to make your own Incubator or Brooder? We can furnish you all the necessary parts for making an Incubator or Brooder, also plans for the best and most practical Poultry Houses.

Did you ever purchase Just Hatched Chicks? We have a Hatchery of 50,000 chicks per month capacity in operation the year round and have, for the past few years. been successfully shipping, in our specially constructed carriers, just hatched Chicks, to distances as great as 2,000 miles. If you need them, book your order early, as our future delivery list is rapidly filling up.

We can also supply White Leghorn hatching egg in quantities desired. If you have not already received our catalogue, write for Catalogue B, and you will find therein a more detailed description with prices, etc., of the above.

Hoping to hear from you in the near future, we are,

Yours Very Respectfully,
MUST HATCH INCUBATOR CO.

The Remarkable Growth of a Big California Industry

From Little Beginnings the Poultry Supply Business of the Coulson Poultry and Stock Food Co. Has Grown to Enormous Proportions.

It was the pleasure of the writer a few days ago to stand on the street of the little city of Petaluma, California, and see the business transacted in the center where the poultry industry has secured its greatest foothold in the United States. The streets were filled with teams of farmers bringing to market the produce of the surrounding ranches, most of which was the fruit of the industry of the prolific White Leghorn hen. Other wagons were equallly as busy taking on their loads of poultry supplies and grains to be hauled to the ranches for the purpose of producing more of the eggs which San Francisco takes, with the best average market of any section of the world.

Standing in front of the store of the Coulson Poultry & Stock Food Co., were several wagons, a couple of which had four horse teams attached, and these were all busy taking on loads of the famous Coulson's poultry foods. We asked Mr. Coulson how many days during the month such a busy scene as that presented itself in front of his store, and he replied that each morning saw great loads start for the large poultry ranches in the surrounding country.

It seemed almost startling, to think of these great loads going out with only poultry foods, until the extent of the business about Petaluma is realized. The poultry business rises to the magnitude of a first-class business venture in Petaluma. Some of these great ranches have as high as 6,000 and even 7,000 laying hens. It is true that there are many "back yard ranches," but the big poultry business predominates. This has been brought about by several conditions and circumstances prevailing at Petaluma. First, the soil conditions and climate are favorable to the best health of the birds. The transportation to the city of San Francisco, one of the world's best markets, is exceedingly low, in fact we are told that the rate is ten cents per crate, with empties returned without charge.

This low transportation, with other conditions mentioned, has given to these poultry growers such advantages that the business has continued to grow, until the business such as Mr. Coulson represents has grown with it until it has great proportions. A faint idea of its magnitude is given by the photograph on this page, wherein the loaded wagons will be observed ready to start, also by the other picture of the partial view of the interior of the manufacturing department. This view is in the basement and the grain, as will be seen at the left of the picture, is received down the chute from the truck and from there it is taken to the millls and mixers which may be seen farther to the right of the picture and in the far background. Thousands of sacks are handled daily, and many tons of meat meal, bone meal and other valuable foods are mixed with the feeds and grains to make up a perfect balanced ration. As to the various ingredients used in these foods, Mr. Coulson tells us that they consist of mill feeds, millet seed, cracked rice, steel cut oats, charred bone, charcoal, meat meal, dried blood, fresh ground bone and various other seeds and foods rich in protein.

These extensive mills and mixing appliances have enabled the most economical handling possible of these foods, and have made possible the manufacture of such large quantities that the sales department of the concern has of necessity been a great factor in keeping the mills busy. This department is quite extensive, and instead of waiting for the customer to come to the store, Mr. Coulson and his assistants have taken their foods to the various ranches, and there demonstrated their actual worth as an egg producing and chick growing food. These agents sometimes travel in automobiles, while others prefer teams.

Regarding this feature of the business, we quote the following, taken from a Petaluma paper of recent date:

"A. R. Coulson and his salesman, J. H. Williams, are just back from a week's trip to western Marin county, having made a big mileage behind Mr. Coulson's new team of spanking grays. They report business brisk and disposed of over fifty tons of Coulson's chicken food during their travels, besides having an excellent time, so they believe the week well spent.

"They visited many poultry farms and Mr. Coulson states that none of the poultry farms out that way have any less than four thousand fowls. Smaller farms are seldom seen. He states that many of the dairy ranches out in that territory are being turned into poultry farms on an elaborate scale.

"At the McDonald ranch of eight acres at Marshall's, there are now five thousand laying hens besides many young fowls. At this ranch he disposed of a fifteen-ton carload of feed, and this is the only lot of the many tons sold by him that will be shipped by train. All of the remainder will be sent out by team and will make work for local teamsters who will do the hauling. So Mr. Coulson's trip was of benefit to others besides himself. There is nothing selfish about Mr. Coulson.

"At the Sartori ranch another carload of feed was sold, and so on throughout the long trip. Messrs. Coulson and Williams returned home on Thursday evening, and on Friday sent three four-horse teams out to Marin county with the first consignment of feed. Next week he will keep the teams busy hauling the remainder."

Regarding these local sales, Mr. Coulson gave us the memorandum of the number made during that particular week, of which the following is a partial list:

A. D. Reynolds, Tomales, 15 tons; Jno. McDonald, Marshalls, 12 tons; M. Sartori, Tomales, 10 tons; Geo. W. Peterson, Petaluma, 3 tons; C. Cerina, Petaluma, 3 tons; Chas. Pozzi, Tomales, 3 tons; W. W. Freeman, Fallon, 3 tons; Wm. Bassett, Tomales, 3 tons; C. Richardson, Tomales, 3 tons; and a number of others who took 1 to 2 tons each.

All told, it is a big business built up from small beginnings, all by putting out goods which have won favor, then pushing with such energy that it had to go. No small factor in Mr. Coulson's success is the free use of printers' ink. There must be no "still hunt" in pushing a new product, no matter how meritorious. People must be informed, then they will take hold.

That's why Coulson's foods sell at the rate of a carload a day.

"Why don't you cultivate the art of oratory?"

"My friend," answered Senator Sorghum, "oratory soothes the gallery to slumber and reads well in the newspaper, but the kind of talk that counts is that which you pour into a man's ear with your hand grasping his coat lapel."—Washington Star.

Queries and Replies

GARDENA DEWBERRIES.

Ed. Cultivator: I want to get some Gardena Dewberry plants. I understand a Mr. Gray of Gardena was the originator of them. Will you kindly send me his address? I see that Rideout of Whittier advertises the Improved Gardena Dewberry. Do you know personally whether his variety is any better than the original.—D. R., Mountain View.

Mr. W. M. Gray is still at Gardena, but does not handle berry plants now. The Improved Gardena Dewberry is an improvement on the original and most of the stock offered for sale is of the improved strain, and not of the old type. We take pleasure however in recommending Mr. Rideout's stock. We believe there is none better.

PAMPAS GRASS.

What are the favorite conditions for Pampas grass? I saw it growing on apparently dry soil near Santa Barbara and it seems to flourish at regular and set intervals along Echo Park lake.—Subscriber, Glendale.

Pampas grass likes a fair amount of moisture, and while young must have it. The idea that it inhabits swamps is erroneous; in its native country (South America) it grows along the banks of mountain streams and not upon the plains. In commerce only the female plant is grown as the male plume is not nearly so handsome. There is a very desirable variety that bears pink plumes and one with variegated foliage, both of which are grown locally. Pampas grass is not a tropical plant, but quite hardy.

CANNING RIPE OLIVES.

Editor Cultivator: Will you answer the following question in your paper? Can ripe olives be prepared and canned at home? If so, how is it done? How are olives pickled?

—H. V. H., Porterville.

The last issue of the Cultivator contains directions for pickling olives. When you make your last brine, place your olives in a wire mesh pail and dip them in the brine while it is boiling. Do not leave the olives in the brine any longer than is necessary to have the boiling liquid come in contact with all of the olives. Place them in the glass jars immediately and pour the boiling brine over them and seal at once. The whole object in view is to kill the germs that cause fermentation which spoils the olives.

INDIGESTION.

A. M. C., a subscriber from Goleta, writes to know what is the matter with his cow. He describes a condition of indigestion. The cough is but a symptom of the stomach trouble. Recent numbers of the Cultivator give remedies for indigestion in the cow and horse. As a preventative to sour stomach powdered charcoal in ounce doses once a day, in feed, will usually effect a cure.

WARBLES.

Editor Cultivator: Will you please tell me through your valuable paper what to do with a cow whose back is full of warbles? and what ought a cow to have, that is in a thin, poor condition, in spite of being well fed.—Mrs. L. F., Sawtelle.

These tumors are produced by the Hypoderma bovis or gadfly. It is advisable to enlarge the opening, which already exists and press out the grub, or turpentine rubbed on the tumor often brings them out.

The second question is difficult to answer. If the cow is well fed, that is on wholesome food, she ought not to be in poor condition. If she continues so the best thing to do is to have her examined by a veterinarian.

PRUNING WICKSON PLUM TREES.

Editor Cultivator: I would like to ask you regarding pruning Wickson plum trees to produce better crops.

I have 200 Wickson trees six years old that have so far produced very little fruit, except in individual cases. Those adjoining a variety orchard containing other kinds of plums have done well the past two years, but odd trees here and there in farther part of orchard have done equally well, so I do not lay it to lack of fertilization of blossoms.

Have been told my pruning is too severe and to do little this season so as to turn wood making tendency to fruiting.

At planting I tapped 16 to 18 inches, and left new growth after pruning each year for five years respectively as follows: eighteen to twenty inches, two feet, one foot, one foot and nine inches.

The trees now have three to five feet of new growth. Trees that have produced heavily for two or three years have had the same pruning as the others.

Your advice will be greatly appreciated.—Rancher, Pasadena.

You do not state if the barren trees blossom freely, but suppose they do not as you bring up the question of light pruning to cheek vigorous wood growth and turn it to fruiting wood. The idea of light pruning for your vigorous growing trees is all right. The feature of certain trees not requiring cross pollination to make them bear has no bearing on the other trees if they do not bloom properly. If they do bloom abundantly enough, the fact that odd trees in isolated places do not require cross pollination does not prove that this will not benefit those which do not bear. The Wickson plum is a very slender grower and a stocky growth is essential in case of heavy bearings, hence it is necessary to do some severe pruning. At the same time we would recommend light pruning of part of the present year's growth. To do this systematically it will be necessary to follow the system used in pruning trelles grape vines. From the description given of the trees, there must be a number of branches of new growth coming from where the last cuts were made. Cut one of these, preferably the strongest shoot, back to 10 inches from the last year's cut and just tip part of the remaining branches and leave the balance untouched. This will give your trees a chance to fruit over practically the entire surface of last summer's growth and at the same time you will not lose control of the form of the tops of the trees. Should more fruit set than your trees can care for, cut back some of the long branches and thin the fruit that remains, to suit yourself. The 10 inch stub which you leave will send up several or at least one good branch which may be used to continue the formation of the tree. Should the long bearing branches appear to make your tree too high or ungainly, cut them back to suit, or remove them entirely. Should this method of pruning prove to give you a satisfactory crop, your new growth from the 10 inch stub will afford you material for repetition of the process.

Should the trees refuse to bear after this treatment, it might pay you to graft a few of them over to some of the native American varieties which we find have a ready sale, the cross pollination scheme would be worked to a good advantage. We would recommend Wayland as sent out by Mr. H. H. Gird of Bonsall, San Diego County. The experiment station at Pomona has a tree of this variety. It never fails and produces a rich, sweet, brilliant red plum that ripens late in October and early in November.

Should you wish one of the good Japanese varieties that will bloom with Wickson and cross pollinate it, graft over a few trees to Sultan. This is an improvement on the Blood or Satsuma plum, being more tender, of better flavor and answering every purpose and a little more, than the Satsuma fulfills.

Remember that one season's trial in anything, whether results are good or bad, does not prove or disprove a theory.

CLIPPING WINGS

Editor Cultivator: Will clipping of wing on hens or roosters affect them deleteriously?—A. M. V., Auburn.

Answer.—No, not if the wings are cut long enough so as not to make them sore.

LIKES THE CULTIVATOR.

R. W. P., writing from Los Gatos, under date of January 3, says: "Permit me to say to the management of the Cultivator, that I like the paper. It is free from unpleasant advertisements which abound in so many journals. It is reliable all through. It is chock full of useful information. I often wonder how so much readable matter is gotten together week after week. Two departments attract me speciallly—the poultry and garden. Then, too, the household is always good. Success to the reliable Cultivator.

ALSO PLEASED.

C. C. C., of Fullerton, under date of January 10, says in a letter to the Cultivator, "I have been pleased from time to time at the splendid improvement made on the Cultivator, and wish for you the success you deserve."

We prize the above very much, for the author is one of the strongest all-around men in Southern California.

A PIG'S TALE.

Within a pen that was not big
A thrifty farmer kept a pig.
That piggy drank, the neighbors say,
A bucketful of milk each day.

A bucketful—all that was in it—
He drank one day in just a minute,
The man then grabbed him by the tail
And dropped him snug within the pail.

The pail of milk was in the pig
And yet the contents were not big
Enough to fully fill the pail
(The truth is strange but must prevail).

Although the piglet was not big,
And though the pailful filled the pig,
The pigful did not fill the pail
And that's the end of piggy's tale.
—T. C. McConnell, in Philadelphia Press.

Young Atherly's Luck

The morning sun lay warm and clear after the rain of the night before, and young Atherly, as his horse loped easily along the wide range, sang aloud for very joy of light heartedness. Out here, away from cities and crowds how good life seemed.

The train was in, and Atherly hurried around the corner, then halted suddenly, dazzled by the vision which confronted him. On the lower steps of the car near the middle of the train stood a girl, her fair hair blowing in the wind, her hands full of pink roses, For a second neither moved. Then, as a voice from within called "Marion" the girl with a quick flush turned up the steps, and Atherly, stricken with the consciousness of his dusty "chaps" huge spurs and smbrero, slipped back. He had quite forgotten his letter. The engine gave a preliminary snort, the conductor yelled "all aboard!" but Atherly still stood motionless, his eyes fixed on the car wherein she had disappeared. As the slow length of the train began to move the girl slipped back to the platform for a moment, and on the ground, almost at Atherley's feet fell a pink rose. To spring forward, seize the flower, then swing aboard the last car as it passed, was to Atherley but the work of another moment. Before he had fairly realzed that it was he on the train and speeding Eastward as fast as steam could carry him.

Practical thoughts forced a way, and his first act was to take account of his stock.

"Jim will take the horse back," he reasoned. It's all right. Luckily I have just about enough for my ticket to New York." Somehow he had decided that she lived in New York. "And as for meals. Well, who knows what may turn up?" with cheerful optimism.

At the next stop he sneaked forward to the smoking car and sat down to think things over. She was certainly a mighty pretty girl! Atherley feeling for the rose hidden is his breast pocket, concluded that he would probably not regret his action.

"But I've got to get busy on the food question."

There were three or four other men on the car, the younger ones chatting together, and another, rather older, reading in a corner. All eyed him curiously, and Atherley had an inspiration, If he worked them right, amused them, told them queer experiences, they might supply him with food and drink, and as for cigars, well he must husband those he had carefully. In pursuance of this idea he moved nearer, and soon held the group enthralled with his breezy frankness.

"So you really just jumped on the train and came," asked an older man at length, when Billy had grown aweary of his talk and moved away, "and for no other reason than you wanted to see the world?' Atherley laughed rather shamefacedly.

"That's what I told those fellows. But I don't mind telling you the truth. It was—it was on account of a girl," he said, haltingly. The older man's lips twitched.

"A girl! How so?"

"I saw her on the car step," confessed Atherley. "And—and I liked her," he ended lamely, not even to himself did he care to mention the rose. "I wonder if you have seen her? he added eagerly. "She had on some kind of a blue skirt, with a white waist, and carried some roses. They called her "Marion."

The older man started.

"Marion!" he exclaimed, "why, that's my daughter," unthinkingly. Then he stopped, rather annoyed. A young ranchman, no matter how charming and gentlemanly, was hardly a person to be presented to the carefully guarded Marion. But Atherley was too absorbed to notice his hesitation.

"You daughter!" he cried. "Really your daughter, oh, I say, what luck! That will save me an awful lot of time and trouble. I expected the deuce of a job in locating her. Though I knew that I should do it in the end." he added confidently. "Do you mind telling me your name?"

"My name?" divided between indignation and mirth. "I am James Arbuthnot," he declared rather pompously. But Atherley was clearly unimpressed.

"Better and better," he cried; "I always was a lucky chap," joyously. The elder man leaned back and stared at him.

"My dear young man," began he, in his most formal manner, " I think we must understand each other. I certainly fail to see where the luck comes in." Atherley, staring in his turn, became suddenly enlightened.

"Of course. You mean that you don't know me," he cried. "Oh, that's all right," easily. "I've heard dad speak of you hundreds of times. I'm Billy Atherley and I've just been out looking up some properties in the West."

The older man's brow cleared somehow.

"Not William H. Atherley's son?"

Atherley nodded.

"The same. So now won't you introduce me to your daughter?" wistfully. It would save such a lot of time."

Arbuthnot, his gray eyes twinkling, looked at the young fellow quizzically.

"If you are much like your father, and I think you are, you would be hardly apt to wait long for my services," he remarked jocosely. "Come along, then. All I ask of you is please not to get married before we reach New York." The tone strove to be stern but young Atherley laughed happily.

"I make no promises," he declared, with gay defiance. "Oh, here hold on a moment,' as a sudden recollection of his unmailed leter recurred to him. Pulling out the envelope he tore it into fragments, letting the pieces float out of the open window.

"It was to say that I wasn't coming home," he explained. "I will telegraph from Chicago. Now. if you are ready."— A. M. D. Ogden.

TREATMENT OF LAGRIPPE.

We have received some requests of late to outline a treatment of this common malady, and while we cannot go into all the details of how to treat it, a few general principle may be given which will be of great advantage to those who give the disease sufficient attention in its early stages.

Influenza or La Grippe as it is generally designated, affect every part of the body. Sometimes its most marked symptoms are in the respiratory tract, or the digestive organs, and at other times its effects are felt in the nervous system. It is nearly always accompanied with irritation of the respiratory tract, and the importance of early treatment of this disease cannot be overestimated, as when it is left to run its course it nearly always produces chronic changes which leave permanent and harmful results in the system. When the disease is first contracted the whole system is more or less prostrated and a certain amount of fever is present. The patient should at once take a hot bath. The effect of the heat will be to enable the system to rally from the depression which has come over it.

This bath should be taken in a warm room, and the patient should get out of the bath when thoroughly warmed and be wrapped in a hot blanket, with sufficient covering to make him perspire freely for a short time. From this he should get directly into a warm bed, being careful that the surface of the body is in no way chilled by making this change. Absolute and prolonged rest in bed until after all the fever had disappeared and the principal symptoms have been ameliorated, is very essential. The patient should take only a mild liquid diet, drinking plenty of hot water, so as to increase the elimination of the skin and kidneys. If the bowels are not sufficiently free they should be moved by means of large warm enemas. If the catarrhal symptoms are marked they should receive attention. If the throat shows signs of soreness a gargle of camphor water every twenty minutes will usually cure the condition. The nose should be sprayed with a solution containing from three to five grains of menthol to the ounce. If there is a marked soreness of the throat or chest, fomentations over the chest, followed with camphorated oil rubs, will do a great deal of good.—Health.

NEITHER A HOTEL NOR A TENT.

"It is better to wear out than to rust out," says an old saw. It is folly to do either. To rust out is to be an idle observer only as the procession of possibilities rolls past. To wear out is to disregard nature's law and the appeals of common sense, and persistently overtax our strength and exhaust our vital force. You do not have to live in a hotel, neither is it necessary that you should come to the opposite extreme and live under a tree. Be natural. Work at something if it is only a fad. Toiling, as many young men do, in an office for the means of paying the butcher and the baker, there is every temptation to fall into the grind that makes middle-aged men old and old men imbecile and decrepit. Don't do it. Find a way to get exercise out of doors. Don't get lazy under the name of being tired, or bored because disgusted. Keep it up for yourself, and not entirely for other people.

VILLAGE AND RURAL IMPROVEMENT.

Changed conditions have made it almost an imperative business necessity that something be done, and that quickly, to make village and rural life more attractive. For years social economists have voiced their fears that the end of the twentieth century would see all our population living in towns— that men would go to their farms in the morning as to an office, returning to town in the evening. Grave things have been predicted for America's future when this should come to pass.

The usual futility of speculating upon the far distant future is proved in this case. Statisticians tell us that the city-ward tide is about at a standstill, while a marked change in public sentiment towards country living is apparent. Formerly, when a man in a small town acquired a competence by good business habits, he grew restless for larger worlds to conquer, and would remove to a larger town or city. He knew that shrewdness is recognized the world over, and did not fear the competition of the city. He knew, too, that if he did not go, his sons and daughters would, just as fast as they could. He did not blame them. Educated at good schools, with tastes beyond the means of the village to gratify, why should they stay? The consequence has been that the best, most enterprising blood of village life has gone to build up the cities.

The persons who have thus changed their places of residence have gained by removal music, art, libraries, a social intercourse that satifies, and the self-respect which comes from living where life moves in an orderly way. The grass and trees are kept trimmed to a decorous neatness. The parks are gay, the people who throng them are gay, too; their clothes fit and are worn with the air which marks so distinctly the urban from the suburban, and our former villager is very complacent over his escape from the dreary, ill-kept village, where not one dollar could be raised towards improvements for the general good; and property owners would neither keep fences up nor weeds down.

What then, you ask, has brought about the change in sentiment towards country living? There are numerous reasons which partly account for it; chief of which are foreign travel, illustrated books of travel, cheap maga-

zines, summer visitors, and electric railways, while the bicycle and automobile have done their share in the good work. The annual outpouring of Americans to Europe has been productive of great good in that the returned travelers bring home a wholesome discontent with the dreary villages and bad roads of their country. When we contemplate a trip to England, is it not thoughts of the quaint, well-kept villages of song and story that constitute one of the allurements of the journey? Think you our village and rural life is of a type to attract the people of Europe to visit us? On the contrary, the visitor to our shores has never failed to comment most unpleasantly upon the lack of beauty and cheerfulness in these respects.

NATURE STUDY.

The common country school is still an unsolved problem. We do not need to picture the surroundings of the most of them, but when we know that environment has so much influence in the forming of character and habits of after life it is greatly to be regretted that early school life should not be surrounded with all the appliances necessary to infuse the mind with a love of the beautiful and a knowledge of the useful. The great majority of us now are, and are to be, dependent upon agriculture and its handmaid, horticulture. It follows then, that nature-study, including plant life, fruits and flowers, should be a systematic part of school life. Nature has done her part for us. We have ample grounds, a fertile soil and a climate adapted to a great variety of productions that enables us to rank with any other people educationally. The city schools are working under different conditions, but the kindergarten has been found to be the basis of much of their superior excellence. Some of the teachers of the city schools will claim that there is no room for more studies, that the pupils are now overworked, and no doubt this is true in some schools. The drill is all mental and intellectual, the physical entirely neglected. We are willing to admit that a broad intellect is more capable of grappling with the necessities of active life than a dwarfen one, but nature-study as indicated has a tendency to develop all the facilities, to stimulate habits of thought and of observation, and to round out an otherwise incomplete life.

A BOY WANTED.

Wanted—a boy that is manly,
A boy that is kind and polite,
A boy you can always depend on
To do what he knows to be right.
A boy that is truthful and honest
And faithful and willing to work.
But we have not a place that we care to disgrace
With a boy that is ready to shirk.

Wanted—a boy you can tie to,
A boy that is trusty and true,
A boy that is good to old people
And kind to the little ones too,
A boy that is nice to the home folks
And pleasant to sister and brother,
A boy who will try when things go awry
To be helpful to father and mother.

These are the boys who are wanted
In the workshop, the home and the store;
The world needs such boys in its business,
For them there are places galore.
These are the boys we depend on—
Our hope for the future, and then
Grave problems of state and the world's work await
Such boys when they grow to be men.—Lizzie Clarke Hardy.

Cookery Recipes

PUMPKIN PIE.

Stew pumpkin cut into small pieces in a half pint of water, and when soft mash with potato masher very fine; let the water dry away, watching closely to prevent burning or scorching. For each pie take one well-beaten egg, half cup of sugar, two tablespoons pumpkin, a half pint of rich milk (a little cream will improve it), a little salt; stir well together and season with cinnamon or nutmeg; bake with an under crust only in hot oven. Some people steam pumpkin instead of stewing it.

* * *

TO SERVE WITH MEATS.

Roast beef—grated horseradish.

Roast mutton—Currant jelly.

Boiled mutton—caper sauce.

Roast pork—apple sauce.

Roast lamb—mint sauce.

Venison or wild duck—black currant jelly.

Roast goose—apple sauce.

Roast turkey—oyster sauce.

Roast chicken—bread sauce.

Compote of pigeon—mushroom sauce.

Boiled fresh mackerel—sauce of stewed gooseberries.

Boiled bluefish—with cream sauce.

Boiled shad—rice.

Fresh salmon—green peas with cream sauce.

THE USEFUL ONION.

Onions are a kind of all-around good medicine.

A whole onion eaten at bedtime will by the next morning break the severest cold.

Onions make a good plaster to remove inflamation and hoarseness.

If an onion is smashed so as to secure all the juice in it it will make a most remarkable smelling substance that will quiet the most nervous person.

The strength of it inhaled for a few moments will dull the sense of smell, and weaken the nerves until sleep is produced from sheer exhaustion.

It all comes from one property possessed by the onion, and that is a form of opium.

The following is a summary of the various uses of fruit in relieving diseased conditions of the body. The list is worth keeping. Under the category of laxatives, oranges, figs, tamarinds, prunes, mulberries, dates, nectarines, and plums may be included. Pomegranates, cranberries, blackberries, sumac berries, dewberries, raspberries, barberries, quinces, pears, wild cheries, and medlars are astringent. Grapes, peaches, strawberries, whortleberries, prickly pears, black currants, and melon seeds are diuretics. Gooseberries, red and white currants, pumpkins and melons are refrigerants. Lemons, limes and apples are stomach sedatives.

THE ORIGINAL "RUBBERNECK"

Giraffes are the most difficult of all animals to take by surprise. No matter from what direction you may approach, the giraffe is sure to discover you. It has been called the original "rubberneck." It is not generally known that nature, because of the height of its eyes from the ground, has supplied it with a talent peculiarly it own for making observations.

There is so much bad in the best of us,
And so much good in the worst of us
That it hardly becomes any of us
To talk about the rest of us.
—Credit Lost.

Edges That Last

Probably you have bought edged tools made of steel that was crumbly, or too soft to hold an edge, or so hard as to be brittle. You may have bought them for good tools, too. There is, however, a sure way to get tools with edges that last. It is simply to ask for the Keen Kutter Brand when buying. Keen Kutter Tools have been standard of America for 36 years, and are in every case the best that brains, money and skill can produce. They are made of the finest grades of steel and by the most expert tool makers. As a complete line of tools is sold under this brand, in buying any kind of tool all you need remember is the name

KEEN KUTTER

The draw knife shown here is an example of the excellence of Keen Kutter Tools. It has a nicety of balance and "hang," which has never been successfully imitated, and it is made of the best steel ever put into a draw knife. In all the years that we have sold this tool we have never heard of one defective in any way.

Yet the Keen Kutter Draw Knife is no better than all other Keen Kutter Tools.

The Keen Kutter Line was awarded the Grand Prize at the St. Louis Fair, being the only complete line of tools ever to receive a reward at a great exposition.

Following are some of the various kinds of Keen Kutter Tools: Axes, Adzes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Tool Cabinets, Scythes, Hay Knives, Grass Hooks, Brush Hooks, Corn Knives, Eye Hoes, Trowels, Pruning Shears, Tinners' Snips, Scissors, Shears, Hair Clippers, Horse Shears, Razors, etc., and Knives of all kinds.

E.C. SIMMONS KEEN KUTTER TRADE ST. LOUIS MO. MARK

If your dealer does not keep Keen Kntter Tools, write us and learn where to get them.

Every Keen Kutter Tool is sold under this Mark and Motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."

Trade Mark Registered.

SIMMONS HARDWARE CO., St. Louis, New York.

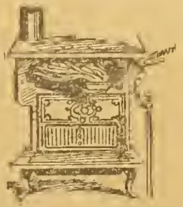
For the Farmers Telephone Line

To make the Farm Line successful and a paying investment for the farmer, none but good instruments should be used. There are many makes offered for this purpose, but few that can stand up to the work year in and year out.

Stromberg - Carlson TELEPHONES

are good instruments. This fact is proven by their years of continuous service and their constantly growing popularity. They cost a trifle more in the beginning, but repair bills soon make cheaper telephones expensive in comparison. Cheap instruments lose their talking qualities and are an aggravation and a nuisance. We have replaced hundreds of them, where lines were about to be abandoned, with our "Strong 'Phone" — which always retains its strong talking qualities, and they made such lines entirely satisfactory again. Write for FREE book 71-M, "How the Telephone Helps the Farmer." It tells why our telephones are best to buy for farm lines, shows just how they are built, and why they give such lasting satisfaction.

Stromberg-Carlson Tel. Mfg. Co.,
Rochester N. Y.
Chicago, Ill.



BURN AIR AND SAVE FUEL

You can do it with the

HAGUE IMPROVED DOMESTIC OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for th least money, write for information to

Hague Domestic Oil Burner Co., 810 So. Spring St., Los Angeles, Cal.

HERMAN W. HELLMAN BUILDING, LOS ANGELES, CAL.

Wanted to Get Even.

"I'd like that tooth, please," said the small boy after the dentist had extracted the torment.

"Certainly, my little man, but why do you want it?" queried the dentist, handing it over.

"Well, sir," responded the gratified boy, "I'm going to take it home and I'm going to stuff it full of sugar. Then I'm going to put it on a plate and," with a triumphant grin, "watch it ache."—New York World.

A NEW DAIRY SUPPLY FIRM.

The O. J. Weber Company, located at 557 S. Los Angeles street, Los Angeles, is now ready to supply dairy and stockmen with every requisite needed in their line, from a creamery outfit to a test tube. While the firm is a new one, it is so in name and goods only. Mr. Weber has for years been the manager for Wickson & Co., of their Los Angeles branch. He has been very closely indentified with the dairy interests of the southern half of the State we believe the dairymen of this section will give him a very generous patronage as a compliment to his geniality and ability. For many years he has been the secretary of the Creamery Board of Trade as well as occupying the same position in the dairymens' organization, both of these unions have been and are today very strong and their strength is largely due to the work of the secretary.

The Weber Company have located in the heart of the milk distributing business of Los Angeles, and will carry in stock or act as agent for manufacturers of every conceivable appliance needed in the production of milk or butter. Mr. Weber will be pleased to meet old customers as well as new ones and show them his new stock at his new location, 557 S. Los Angeles street, which is within a stones throw of the great Huntington building.

San Luis Obispo County Lands. Best and Cheapest in the State. Rainfall abundant. Colony Lots, Farms, Orchards, Stock Ranches, Town Lots, Business Openings, Mines. Offices opposite R. R. Depots. Oceano and Arroyo Grande, Cal. Call or write for price list.—Beckett Realty Co.

San Francisco Markets.

San Francisco, Jan. 17, 1906.

Butter.

No important changes concerning either prices for the various grades of butter or the tone of the market were noted yesterday, and general business was restricted mainly to the filling of routine needs.

CITRUS MARKETS

NEW YORK MARKET.

New York, Jan. 16.—The market continues depressed, and although but 15 cars were sold at auction today prices ruled lower than at yesterday's sale. Taking into consideration the excellent quality of the fruit offered, the prices realized today are the lowest of the season, and with 55 cars remaining on track after today's sale and about 10 cars due, the prospects are not favorable for the realization of better prices for several days.

HORTICULTURAL SANITATION

(Continued from First Page)

and state and even from foreign countries, when it is quite possible that better stock could have been purchased at less cost from their local nurseries. They know nothing of the existing conditions of these places, yet they deem it expendient to procure these plants without authorities. They must surely realize what grave chances they are running of intorducing some very dangerous pests or diseases, and should, instead of having a proper inspection, and also fumigation, if there is the least possible cause for suspicion.

How the grower can look upon such treatment as working an injustice to him, and why he should seek to evade such conditions, thus thwarting the work of his protector, for, surely, in our campaign against our fruit tree evils, the quarantine work is the most important, and had greater care and diligence been used years ago, what a cost would have been saved to the grower. Today instead of relaxing in any way our watchfulness, every one connected with the industry should feel it his duty to strengthen the commissions which stand as barriers between the horticultural industries of California and the insect and fungus invaders.

Surely, in no field of activity, do precise methods and clean culture, bring better results to the individual than in horticultural pursuits. If you should ask me how the ideal conditions are to be brought about, I would say, by a concerted universal campaign or careful methods, by which no phase of the industry would be left susceptible to an attack, by either insect or disease, by cleaning up and keeping clean every nook and corner where an insect could pass the winter in comfort, by fumigating every box, sack, basket, or tray used about the orchard, packing-house or dryer.

One hopeful sign is that many of the growers are now washing their boxes with powerful disinfectants wheneve they come into contact with such diseases or fruits as Bitter Rot of Apples, apple or pear scab, etc.

Packing-houses and dryers should be fumigated at the close of each season both for insects and diseases. Prunings from trees should never be dragged through the orchard, but should be destroyed on the spot or hauled to the place where they are to be burned. Why wait for the commissioner to cut out the weeds and thistles? Why allow the country road to remain a stock breeding place for all kinds of noxious weeds? If the roadmaster does not attend to it, clean them out yourself. In short, be not one of those who, instead of having their own interest at heart, instead of having the good of the industry at heart, seem to have only the narrow interest of getting rid of their rubbish, in the quickest and easiest way, regardless of these interests. The great actuating principle with us should be, advance and improve; study and seek continually to get a better and wider knowledge of our business, that we may not only be able to make it a sure and sound financial investment, but, also, a fascinating occupation, and in this way and in this way only, will be enabled to gain and occupy the foremost rank in the horticultural world.

Looking to the future of this great State, we should not count it greatest in cities, in manufacturing or commercial enterprises, or even in its mineral productions, for, as great as all these resources are, they are in no way equal to the capabilities of soil production, but it takes seeing and thinking active and energetic work to make the latter more than equal the former in productive wealth.

A RELIABLE FIRM.

The Johnson & Musser Seed Co., of Los Angeles, have issued their 1906 catalogue and following their custom of previous years, have made it an improvement upon its predecessors. This house is headquarters for field, garden, flower and tree seeds, bulbs, implements, lawn mowers, hose and market gardeners and general ranch supplies in the above lines. Their watchword has always been "Reliable Seeds" and by keeping it ever in mind they have built up an enviable reputation for reliability.

IMMUNITY FROM ROUP.

Many poultry raisers in California are today getting admirable results from the use of a most excellent remedy known as Kileroup. It gives healthy, vigorous fowls with plumage of beautiful luster. It is good for swell-head, canker, chicken-pox and is so effective that we can show many testimonials from many satisfied customers who are our best advertisers. They all say, "I can conscientiously rccommend Kileroup."

A sample can and circulars will be mailed on receipt of 25 cents.

KILEROUP Co.,
442 E. 20th St.,
Los Angeles, California.

NINE OUT OF TEN.

Lordsburg, Cal., Jan. 15, 1906.

California Cultivator: I endorse copy for advertisement. Last year I could not supply the demand for eggs and from three papers that I advertised in I will guarantee that nine out of every ten letters received, mentioned the Cultivator. This year I am better able to take care of the trade.

Yours truly,
T. E. MILLS.

IT'S PENNY WISE

WOMAN'S BREAST AND MAN'S LIP

Most Common Places for Cancer

[San Francisco Examiner]

The papers recently made reference to people cured of cancers without knife or pain by Dr. & Mrs. Dr. Chamley & Co. Since then their cures of many prominent people have occasioned much comment.

These people say their cures were most marvelous, many of them having been given up to die. They first obtained the Doctors' book, the best ever published, teaching that any lump in woman's breast is cancer. It lead, they say, to the greatest blessing of their lives. This instructive book is sent free to those describing their cases.

All the leading newspapers and medical journals of the world have noted the Doctors' wonderful cures. They charge nothing until cured and offer $1000 if they fail. It is said they have cured more cancers than any other physicians living. No X Ray or other swindle. A Pacific Island plant extract makes the cure in the privacy of the patient's own home. Address, 25 Third Street, San Francisco, Cal.

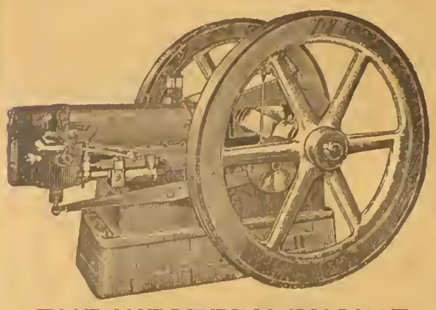
THE WESTERN GAS ENGINE

"From Factory Direct to User"



Designed and built by Western experts for Western use with Western fuel. In construction the Western embodies many original, yet practical ideas, which place it in advance of any other make on the market today. The simplest, strongest and best engine for

Irrigation, Power and Electric Plants.
Any Size from 5 to 500 H. P.

Burns cheapest fuel—gasoline, distillate or crude oil—with a saving of 20 to 40 per cent over any other style. **Send for Illustrated Catalogue** fully describing every detail of construction; tells **how** and **why** the Western excels all others; it gives the facts—the proof. Learn what Western engines are doing for others. Send your name today—ask for latest issue, A6.

Stockton Reversible Gang Plow

EFFECTIVE DURABLE LIGHT OF DRAFT

This is our regular Plow and Land Shifter and Rear Lever. Land Shifter simple and durable. It is in easy reach of operator and there is no danger of wheel running over foot.

Houser & Haines Mfg. Co.
Stockton, Cal.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pump-head using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

Malthoid Roofing

is made by the original makers of P & B Ready Roofing which they began making in 1884. The same company has been studying the roofing question ever since, and perfection has been reached at last, in Malthoid which is the

Result of 22 years' experience

It is the best ready-to-lay roofing on the market, both in the material that goes into making it and the knowing how to make a roofing which will make a roof weather and water-proof; that will stand heat and cold; resist fire; and make the building it covers warmer in winter and cooler in summer. Any one can lay it. It is the only roofing that meets all cases.

How about your hog house, for example? It pays to have a good warm hog house. Why not cover it over—roof and sides—with MALTHOID? It will be absolutely dry; no wind or snow can go through it. The loss of one hog will cost you more than the cost of the MALTHOID to cover it. How about the poultry house, too? Will it be warm enough in zero weather? No building is too good to be covered with MALTHOID; it is so cheap it can be used on any shed.

Agricultural Education in California

Why the Friends of Agricultural Progress Believe That Agriculture Should and Will Be Taught in the Public Schools,

by A. C. True, Director of U. S. Office of Experiment Stations

The movement for the introduction of instruction in agriculture into secondary and primary schools is passing rapidly from the stage of agitation to that of action and realization. The agitation of this subject in this country began in the days when Washington, a great farmer, as well as a great general and statesman, was the foremost man in the new Republic. It has ebbed and flowed many times since then without leaving any lasting impression on our educational system until within the last decade it has gathered such volume and assumed such substantial form that the permanent accomplishment of its object seems assured.

When we inquire why this is so the reasons are many, but they may be grouped under two or three main heads. In general, the claims af agriculture to a place in our public school system are based both on the economic, social and educational needs of agriculture and agricultural people as related to our present civilization, and on the pedagogic requirements of a school system which shall be adapted to the masses of people in a democratic and industrial state, and to the symmetrical culture of the mind and body of the human child. In a word, intelligent farmers and learned pedagogues approaching the subject from their respective standpoints now meet on a common platform, and, each party using the arguments appropriate to his calling, agree that agriculture is a fit and useful subject to be taught in public schools. Hence the friends of agricultural progress in this country have good reasons to believe that ere long agriculture will be generally taught in our schools and for a permanent part of the public school curriculum.

An old argument, which has not altogether lost its force, is that agriculture is a great and fundamental industry. In the United States alone, leaving out the forests, about 850,000,000 acres are devoted to agriculture; there are nearly 6,000,000 farms on which 10,00,000 men work for the direct support of a rural population of 40,000,000 souls. The value of these farms and their equipment is over $20,000,000,000, and the value of their products in 1905 is $6,415,000,000. "The manufacturing industries that depend upon farm products for raw materials employed 2,145,000 persons in 1900, and used a capital of $4,132,000,000."

But the highness and fundamental character of agriculture may be used chiefly to draw attention to the economic, social and educational needs of the agricultural people as a large section of the community using the public schools. Economically speaking, the farmer or horticulturist of today and of the future must be a more intelligent and better informed man than his predecessor in order to compete on advantageous terms with men in other callings and to secure sure and adequate returns for his labor and capital.

Moreover the American farmer needs to learn somewhere that in the age on which we are now entering the co-operative spirit will be more and more essential to the best economic conditions of agriculture, as of other industries. The farmer in this country has thus far been the bulwark of an individualistic organization of industry and of society in general. But we are beginning to see that excessive individualism in industry is resulting in an overweening aristocratic or plutocratic or oligarchic control of industries, and that in some way we must evolve the true co-operative organization of our industries if we are to preserve the democratic character of our social and legal institutions. The farmer boy, studying agriculture with his comrades in the public schools, will more rapidly grasp the idea that community interests are advantageous in agriculture, and we shall thus produce generations of farmers who will work together for the right advancement of their industry.

The unintelligent farmer in every age and land has sunk to the level of a stolid and unprogressive peasantry, and in this way, in spite of the efforts of great statesmen and philanthrophists, the general level of prosperity among farmers has been kept very low.

But in addition to the economic needs of agriculture there are the social needs of agricultural people. In obedience to the general influence of our developing civilization and the peculiar tendencies of farming under irrigation our Western farmers are inevitably being drawn into closer social ties and the currents of their lives are intermingling with those of the communities in which they live in ways which as yet they are loth to recognize and the general results of which they are as a rule innocent or too ignorant to discern.

Meanwhile the other forces of society are more and more banding themselves together to control the ballot box, legislation, social institutions, and the general conduct of affairs. Unless the farmers can be educated that as a mass they will have the co-operative spirit, have some real and vital understanding of community of interest, and know how to mingle to their own advantage with men of other vocation, their lives will forever run in the narrow and monotonous channel and the control of even their own affairs will largely pass into the hands of other men.

But if our agricultural people have great economic and social needs, they also have what may be termed educational needs which are even more important and fundamental. For after all it is the untrained mind of the farmer which holds him down to the dull routine, keeps him in isolation, and condemns him to comparative poverty. And by education, I do not of course mean merely the imparting of information. It is rather the development of the mind, the broadening and clarifying of the mental outlook, the giving of the right turn to the mental processes, the strengthening of the will and of the power to use appropriate means of accomplishing useful ends. The education which the farmer needs is that which will give him some real appreciation of the progressiveness and scientific spirit of the age in which he lives, will arouse a keen interest in the facts and principles of science as related to his own vocation, will show him that in agriculture is an ample opportunity for lifelong studies which may refresh and delight the mind, as well as minister to material success, and in general will lift agricultural practice out of drudgery into the domain of intelligent and hopeful labor.

So the farmer comes with his economic, social and educational needs to the teacher and asks what the schools can do to make him a more successful business man, a better citizen and neighbor, a more intelligent and happy man. And he expects an answer based on an intelligent and sympathetic appreciation of his needs, as well as an up-to-date understanding of the functions of a public school system organized in accordance with reference to the requirements of the masses of youth in a democratic state and ideals of education which however firmly they may be rooted in the general experience of mankind in the past are nevertheless growing and expanding in the light and air of the twentieth century after Christ.

The educator who receives the farmer in this spirit, can, I believe, give an encouraging reply to his appeal. The American public school system was at first developed chiefly in the efforts to overcome illiteracy among the masses. Even when the high schools were established their courses were almost exclusively literary.

As millions of children came to be in the elementary schools and hundreds of thousands in the high schools it became apparent that the old literary curricula and the general atmosphere of school life on the old basis created a distaste for the manual occupations in which the vast majority of all the students in public schools must engage during their after life.

And thus the problem has presented itself to our educators of so changing the public schools as to bring their work into vital relations with the real life and activities of the masses of our

(Continued on Page 95)

Irrigation in Central California—Headwaters of the San Joaquin River.

Deciduous Fruit Culture

GRAFTING AND BUDDING WALNUTS.

Old trees are more economically worked over by grafting than budding as far as is now known. The process is to cut the branches off as is usual with any sort of tree that is to be grafted, leaving the stumps of the branches so distributed as to retain the symmetry of the tree. This can be done at the time of inserting the grafts, which should be in the spring before the new growth starts. The reheading should be so done as to use the smaller branches as much as possible, cutting them off above the main branches or forks. The reason for this is, that small stumps will heal over quicker than large ones. We like the saw graft better than the cleft, as the latter squeezes the scion too much after it is inserted, and young walnut wood being of a soft nature much damage is liable to be done in very large limbs unless the pressure is eased by inserting wedges in the center of the stump. The saw graft enables you to fit the scion into place snugly without undue pressure, and also leave a solid stump. The incision is made by cutting across the corner of the stump, making the long cut down the side and going in on the sawed end just deep enough to admit the full width of the scion. This is then trimmed off with a sharp knife by placing the blade lengthwise with the sawed incision in the bark. Two cuts will fix it, and make the widest part of the notch at the top. If the scion is trimmed to the same angle, it can be fitted snugly by pushing down from the top. If you have much work to do, it would pay to have a machine made which will cut out the notches in the sawed-off branches and trim the ends ofyour scions. Then you would have perfect fit all the time.

The scions should be either two or three years old wood and about four inches long, with at least three buds each. One year old wood is nearly all pith and very soft and very hard to handle. After the scions are all in, apply a coating wax, which is kept warm over a small coal oil stove in a box or old nail keg. After the points of union are all well waxed, take old cotton cloth and tear it in pieces so that they will cover the wax, then paint over the cloth with wax again, waxing down the edges well. The wax is most easily and better applied with a small paint or varnish brush. If this part of the job is well done, there will be no need of going over the work again with wax. When the cloth is not used, the wax will invariably crack along the lines of union, which will tend to reduce the percentage of success. Two inside barks of scion and stock must invariably be matched or the work will be lost, as it is impossible to secure a growth that will make a union unless this is done. When seedlings in the nursery are to be grafted it is very difficult to do this if the scion is placed in the incision so that the barks will be parallel, because the bark at the base of seedling walnuts is considerably thicker than on the top, proper. It is better to incline the scion either in or out a little, which will insure a union at two place which will enable the scion to start when the union will soon extend along the entire length.

When budding seedlings in the nursery or suckers on old trees is to be done, band budding is usually practiced. This is done by cutting out a piece of the bark around the small branch and placing a piece of the same size and containing a bud in its place. When an ordinary budding knife is used, the bark containing the bud should be first taken from the scions of the variety used, lay it over the branch to be budded and mark the size of the bud. The better way, however, is to have a double bladed knife made; this should be made of good steel and the blades should be heavy enough to be rigid, and about two and a half inches apart. With this appliance the ringing of both stock and scion is a simple operation and can be rapidly and accurately done even with the eyes shut. It is necessary that the bark on the scion and stock both should slip easily. This requires that the work must be done during the growing season which is midsummer. The buds should be wrapped with waxed cloth.

Owing to the prevalence of the blight on walnut trees, we think it desirable to disinfect the waxed bands before using. This can be done by dipping them in a solution of bluestone water, and rinsing them thoroughly in pure water before using. The bands should be used dry, of course.

SCALE ON APRICOTS.

Editor Cultivator: Would you kindly advise me as to what would be the best spray for my apricot and walnut trees? They are infested with willow scale and moss—apricot trees also have some black scale. When would be the best time to apply spray?—Subscriber, Arroyo Grande.

Having noted the universal success with the lime, sulphur and salt wash, we may be a little prejudiced in its favor, but there are certain things about it which none of the other bug washes have. It is not only an insecticide, but a fungicide as well. The general effect on the trees is so good that there are two formulas prescribed, one a strong solution when scale is to be fought and a weaker one when it is desired to "brace up" the trees or make clean fruit. It has eventually become customary to add about four pounds of bluestone, which virtually makes a combination Bordeaux and insecticide wash. Trees sprayed during the winter and some months before they bloom are about a week later in blooming. When washes which give a dark color to the trees are used, the blooming period is hastened. After taking all these things into consideration, we have recommended the lime, salt and sulphur wash for scale on the different deciduous trees. While it is more expensive than some other washes, it has a good effect on the trees and no damage can be done through its use, unless used too late in the season. It can be used up to the time when the buds begin to open.

TRANSPLANTING STRAWBERRIES

Editor Cultivator: In the next issue of The Cultivator, if convenient, kindly inform me which is the best way to transfer strawberry plants—to shake all the dirt out of the roots, or to keep as much around them as possible—the plants being close at hand?—I. M. P., Lakeside.

No soil is necessary, as the strawberries are very easy to transplant. Many growers prune the roots to two inches long, and it is best to pull off all the older leaves.

Experiments are being made in Los Angeles which it is hoped will result in establishing a better method for shipping strawberies. A plan now being tried consists of putting the berries in crates which are rendered air tight by the use of heavy paper. It is believed this will result in greatly improving the present conditions. California growers and shippers of strawberries are very anxious to be able to have their berries reach eastern markets in first class condition, as they claim that a very profitable business would result.

BY PROF. A. J. COOK

AMERICAN HONEY IN EUROPE.

I wish another word on this subject of our developing a market for American honey in Europe. I have now made quite a thorough examination and find almost no honey in the city of Berlin, though I do find not a little American fruit—much dried and some fresh—especially apples and pears. Honey is as easy to ship as the former, much safer to transport than the latter. The honey that I find here is sold in a form that would find no buyers at all in our American markets. It is simply sold in great pieces often of very dark comb, in open dishes, such as we in America used to see thirty or forty years ago, and the price for this is one mark—25 cents per pound. Of course the poor cannot afford to purchase this, and the rich would not be tempted to take it unless honey was specially toothsome. The appearance would surely tempt no one. Our beautiful sections are a real ornament to any table.

It may be that a high tariff would preclude sale of our honey here in Germany. We know, however, that our late president, and the present one, both strongly favored reciprocity, that tariff might not too seriously depress trade. If necessary, we can bring our influence that will secure such legislation as will permit the entre of our honey into the European markets, especially as it could easily be demonstrated that such action would be a blessing to both people and an injury to none.

I see the type made me say in a recent Cultivator what is incorrect as to price. I meant to say: We can afford to sell extracted honey for six cents and comb for ten cents." This could be sold for more than twice this amount in the European markets, with no injury to their home production. It would also help the European bee keeper, as it would spur him up to better work. I am perfectly certain that here is a field worth cultivating, and I sincerly hope our two great organizations will take energetic action in the matter. Transportation by sea is cheap, and safe, and rates could be secured by effort, that would leave a good margin with the producer.

* * *

BEE HIVES IN GERMANY.

It would cause great wonderment were we to see any farmer in a civilized country plowing with the unmodified forked tree, such as our way-back ancestors used to stir the soil. Nor would we see it in Germany, for our German brothers are fully abreast of the times in the matter of plows. Not so, bee hives. In the fine Agricultural Museum in Berlin, is a large exhibit of bee hives, straw and wooden. This exhibit, like all in the building, is supposed to be large and qute complete. Prof. Plate, the able head of the Agriculture Department of the government, told me that the exhibit was a very complete one. It is a matter of great surprise to me that the enterprising Germans, who in most lines of agricultural progress are away to the fore front in both implements and methods of work, in the matter of bee hives are way behind the times. I think most American bee keepers greatly appreciate the valuable services of Rev. L. L. Langstroth who gave us the movable frame bee hive, yet one must look in upon the bee yards of Germany to fully appreciate what he really did for us. The German hives are all tightly closed above. Thus the only way to get into a hive in the case of the oldest unimproved kind is to do as we do with our box hives, turn it up side down and work from the open bottom. These are by far the most common hives in Germany. No respectable or at least no enterprising American bee keeper would use such a hive. Indeed such hives are a menace to the safety of the industry, for in these day of foul brood attack the bee keeper must be able freely, at will to inspect every nook and corner of his hives, that he may see whether or no the insiduous disease lurks in his apiary. In some of the states, I think they legislate against such hives as too dangerous to be tolerated. Many of the oval topped straw hives of Germany are very pretty to look at, and would charm the poet, but they are no longer desirable and our German brothers should not be slow to find this out and act on the knowledge. The improved ? hives of Germany open on the side, or end. and while the combs are in frames, which often hang on a rabet as they do in our own hives, yet they must all be drawn out from the end door, which work must be so awkward and tedious, that I fear manipulation must be avoided in many cases, even when the condition of the bees makes it very desirable to give to the hive a most thorough inspection.. In many hives there are no frames, only the top bar, so that the combs are fastened to the sides of the hives. In this case removal of the combs demands that all be cut loose from the hive at both sides. It is said that the great D'Zierzon became very expert in this cutting, and manipulation. We cannot imagine such hives in the apiaries of our wide awake American bee keepers; indeed in these days of bacterial diseases, such hives are seriously objectionable. It would certainly pay Germany a rich interest on the investment to secure a well equipped model American apiary, and set it up where the German bee keepers could duly inspect the hives and see how superior. is the top-opening hives to the ones now in use. America can teach, not only Germany, but all Europe a whole lot of very interesting and valuable truths regarding hives and the management of bees.

* * *

THE EUROPEAN SPARROW.

I am surprised to find this little finch much less common in Europe it native home, than it is in America. The birds here are very fat and plump, but not very common, or better, not very numerous. Charles Darwin called attention during his lifetime to the fact that introduced species of both animals and plants, are likely, in a favorable environment, to outstrip the related native species. It is a well known truth that our most destructive insect pests are those that have been introduced from the outside It would be interesting to know what handicap keeps this pugnacious little European sparrow from flourishing as it does in its new home in America. I shall talk with Prof Plate and others, in the hopes that I may get light in the matter.

By the way, this little bird has nearly overspread our country.

I think Southern California, and perhaps Arizona alone remain free from its presence. We may fear, yea, expect, that it will soon invade our precincts. It will be interesting to note what its relations to the little red breasted Linnet, when it comes to our Southern California towns and cities. The habits of the two birds are very much alike, and if the sparrow can outdo the Linnet as a mischief maker it may surely claim a record.

* * *

ROAD REPAIRS.

I notice, here in Germany, as in England, that the little mounds of crushed stone are kept close by roads and at very frequent intervals, that there may be no excuse for delay or neglect when a "chuck hole" begins to form. The excellence of the roads everywhere in Europe, is enough to give the country renown, and claim admiration. No country makes a mistake in using any and all hints to make its roads first-class. Good roads always pay big interest on their cost. Let the frequent heaps of gravel dot our American roadsides.

GRAPES draw large quantities of POTASH from the soil. This must be replaced in the fertilizer, else the vine cannot thrive.

Interesting pictures of grape vines, grown with and without POTASH, are shown in "Plant Food," one of a number of valuable books for the farmer, which we send free for the asking. Send name and address.

Address, GERMAN KALI WORKS, 93 Nassau St., New York.
Meyer Wilson & Co., San Francisco, Cal., are sole agents for the Pacific Coast.

The Two Best Spray Nozzles

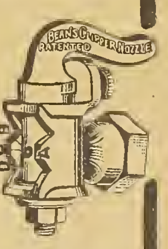
The Bean Cyclone Long Distance Spray Nozzles

ARE EASILY CLEANED by simply jabbing against a limb which throws the cap back onto a steel needle. The pressure instantly returns the cap to position.

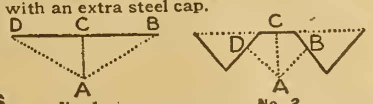
MAKE A BEAUTIFUL SPRAY with **great penetrating force** because there is no abrupt bend in the nozzle to retard it.

ARE LIGHTEST on the end of the rod; **SIMPLEST** and **MOST DURABLE** because one cap will last as long as 5 or 6 of the ordinary kind.

HAVE NO SPRINGS or cumbersome parts to catch in the limbs. Packed one in a box with an extra steel cap.



Bean Clipper Nozzles



throw a broad, fan shaped spray with practically no waste or drippage. In Drawing No. 1 notice it is nearly twice as far from the discharge hole A to the edges of the nozzles at B and D as from A to C. This adds so much friction to the outside **edges of the spray** that they fall short and **are wasted.**

In Drawing No. 2 it is an equal distance from the discharge hole A to all of the points B, C and D. Hence all are treated alike and a **perfect spray results.**

BEAN CLIPPER and BEAN CYCLONE NOZZLES can be secured of your hardware dealer or will be sent postpaid on receipt of $1.00. We also manufacture Vermorel and Side Cyclone Nozzles. Catalogue No. 16 describing Hand Pumps or No. 18 describing Power Sprayers sent free upon request

BEAN SPRAY PUMP CO., 161 West Santa Clara Street, San Jose, Cal.

TREES

CALIMYRNA FIG

There are a great many sorts of Smyrna Figs. We catalogue six kinds, but these do not comprise our entire collection. There is only one variety, however, which five years production on a commercial scale warrants us in recommending it for drying purposes, and this particular variety we have designated as above to give it the distinction it deserves. When you buy your trees from us, you know you are purchasing stock originating from pedigreed trees, which have been producing the highest grade of fruit for a period of years. When you purchase a thousand peach trees, you usually designate what you want. You certainly would not permit your nurseryman to send you a lot of varieties, without labeling them, if you could help it. Well, it is the same with the Smyrna fig, some are early, others late, some are purple, others green. Can you afford for the sake of saving a few cents to take chances on buying trees, which cannot be relied on. We were the first ones to demonstrate the value of this fig, and with our seal we guarantee the genuineness of our trees. Prices lower than ever before.

FRUIT TREES

Are grown on a deep, alluvial river bottom, virgin soil, consequently the root system is as perfect as good soil can make them. Our assortment of apples, pears, peaches, prunes, apricots is more complete than ever.

ORANGES AND LEMONS

Our stock is grown in Exeter, the famous thermal belt of Tulare County. The soil is a rich, deep, black loam, just the kind which develops the highest grade of fruit, as well as the most perfect type of tree. Our assortment consists of all standard varieties of Oranges, Lemons, Pomelos, Citrons, Limes, etc. Carrying out the lines already established in the other branches, we do not confine ourselves to one or two standards and no more, for although it costs money to keep up a stock of many varieties, we want to be on top in this, as well as in everything we specialize in the nursery business.

GRAPE VINES

If you do not know it, you ought to know that we are the largest growers of vines on the Pacific Coast. We are not only growers of raisin, wine and table grapes, but we are also making a specialty of vines grafted on Phylloxera resistant roots. Our great and enterprising neighbor, Mexico, is having its vineyards devastated by this pest, and we have already sold two orders to prominent vineyardists there, who know what our stock is, consisting of eighty thousand grafted vines. How did we get such orders? Because we had pleaseo our customers before, so they had no hesitation in patronizing us again.

ORNAMENTAL STOCK

Our stock of Texas Umbrella trees branched in all sizes, guaranteed absolutely true to name, is better than ever. We are extensive growers of Poplars, Mulberries, Maples, and all deciduous ornamental trees suited to our conditions.

In evergreens, we have Acacias, Eucalyptus, Palms, Roses, Greenhouse plants, in fact everything you want for your garden.

OUR NURSERIES

Eleven hundred acres in four distinct places. Expensive to run a business so widely distributed. We konw it. Why do we not concentrate all in one place? Because we want to be in the position to grow the best of everything, and to do this, must select the soil to suit the tree, shrub or vine. No use to grow a tree where you know beforehand the conditions are not favorable for its perfect development. That is what twenty-one years of experience does. It places us in the position to grow the very best stock. In making a plea for your trade, we do so, not because we have the cheapest stock, but on the ground that when you favor us with your business, you will get the best which money, brains and experience combined can grow.

CATALOGUE

We will mail our large profusely illustrated Catalogue, English or Spanish, to any address on receipt of 5c postage. Price-list mailed on application.

PAID-UP CAPITAL, $200,000.00.

General Agriculture

SUPPLEMENTING STABLE MANURE.

The maintenance and fertility in farm lands is not possible with the use of only the manures produced on the farm. It has even been found that by the use of manure produced on the farm, and applied at the rate of fifteen tons per acre yearly, the grain yield averaged only twenty-one bushels of wheat, thirty-five bushels of barley, and fifty-four bushels of oats as a result of twelve years continual dressing.

The average farm crop uses plant food in about the proportions of 10 parts of nitrogen to 10 parts of potash and 5 parts of phosphoric acid. As farmyard manure contains for each 10 pounds of nitrogen, about 10 pounds of potash and 5 pounds of phosphoric acid, it would seem that it is a fairly balanced manure for general crops. In fact, this would be the case, but for the fact that much of the nitrogen in general farming is derived from the air through use of legumes, in rotation or otherwise. We must first consider what is meant by a "well balanced" manure or fertilizer. It deals with the law discovered by the eminent agricultural chemist, Justice Von Liebig, that the food of plants consists of three substances, nitrogen, potash, and phosphoric acid; and, that all plants must have these three substances in certain definite proportions, stated above. No excess of any one, or any two for that matter, can enable a crop to grow when there is a shortage of the other one.

Thus plants use certain quantities of each of the elements of plant food; if there is sufficient nitrogen and phosphoric acid for a full crop, but only enough potash for a half crop, a half crop only will grow. Not only this, the excess of nitrogen and phosphoric acid is likely to be lost through drainage, dissipation in the case of nitrogen or change into soluble and unavailable forms in the case of phosphoric acid. Consequently, it is certainly lack of prudence on the part of the farmer to use plant food elements in great excess as compared with another one. These points must be kept in mind in order to understand why even with a liberal use of farmyard manure crop yields will fall off, unless together with the manure be used potash and phosphoric acid.

In a four year rotation of corn, wheat, clover and hay, in order to supply the plant food removed, and in the proper proportion, there will be needed in addition to every 10 tons of farmyard manure used, 41 pounds of potash, and 9 pounds of phosphoric acid, represented by 85 pounds of muriate of potash, or sulphate, or 350 pounds of kainit. In the case of phosphoric acid, about 100 pounds of acid phosphate or bone meal should be added. This, in a few words, explains why farmyard manure is not "well balanced." There is onther reason why fertilizer nitrogen must be conserved as far as possible. It costs twice as much as either potash or phosphoric acid. If all the nitrogen contained in the four year rotation of crops had to be purchased in market, it would cost something like $54.00, or $13.50 per acre, each year, a cost practically prohibitive. Thus not only should we watch the balancing of our manures for fertilizers to prevent clover sickness, but also to save our heavy cost in nitrogen.The figures given above are exact. As a matter of fact, in practice, all plant food applied cannot realize in crops. There is always some loss—another reason why we should watch the proportioning of our plant food more closely.—Geo. Wright.

WHITE MELIOT.

(Melilotus alba.)

As a whole this section of the country grows a large quantity of Sweet Clover, or Melilotus, as we call it. In the first place it was sown on waste places to redeem the land. As a land restorer or enricher it has no equal here. Then the cattlemen began to see and learn its value for pasture. There is no grass or clover here that fattens cattle so fast as Sweet Clover does. A cattle raiser informed me the other day that people had told him that it wasn't Sweet Clover, but Johnson grass, that fattened his cattle. "But," said he, "I noted that my cattle didn't gain so rapidly after the Sweet Clover had gone."

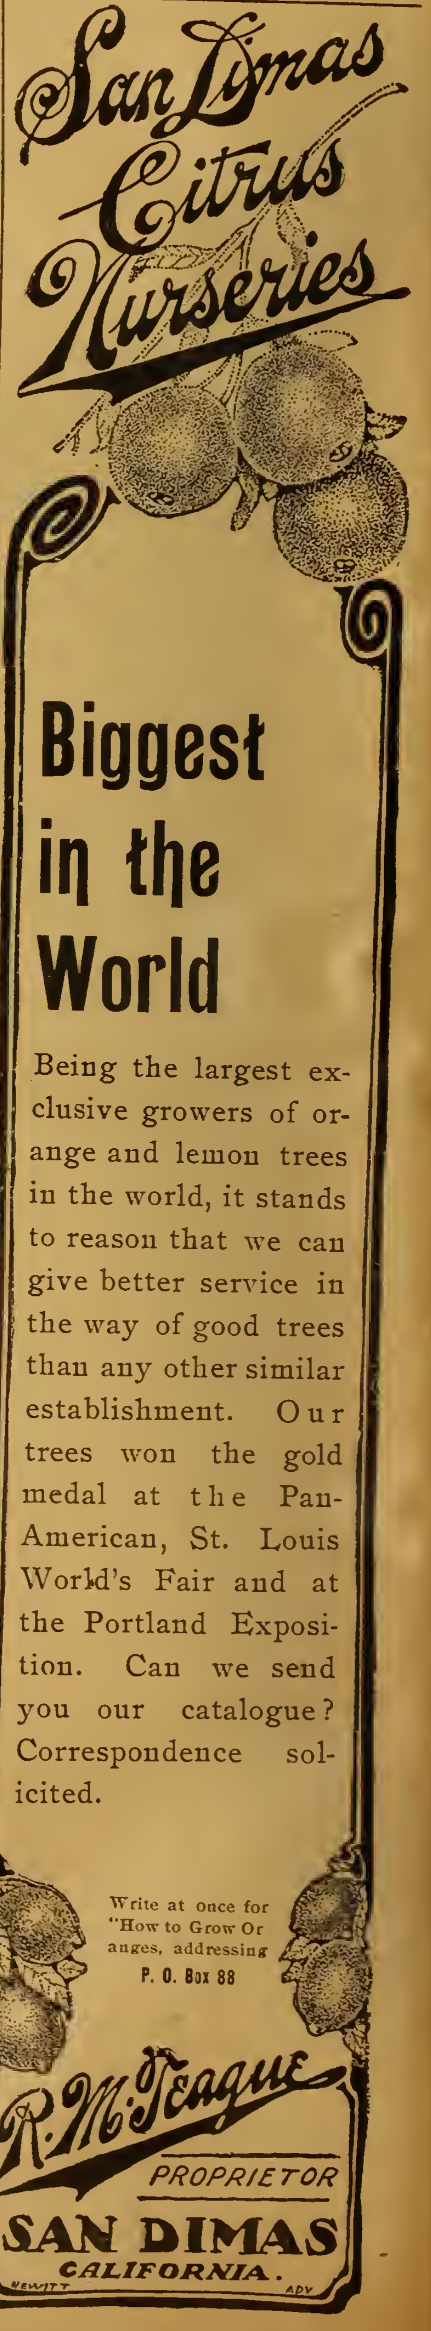
It makes good feed when cut at the proper time, and the stock relish it very much, leaving their other hay to seek out every spear of Sweet Clover, and eating even the coarse stalks.

But right here, in my best judgment, is where the good qualities of Sweet Clover have been overlooked. Sometimes, if not quite often, when stock have not been raised on Sweet Clover they have to learn to like it; but after once learning they never cease to make use of an opportunity to help themselves to the once distasteful stuff. I have known of horses that when first brought to this section wouldn't eat Sweet Clover at all; yet in a short time they had learned to like it so well that, if turned out to graze, you would see them leave all other grasses and seek out a green plot of Sweet Clover, there to feed on their choice of the field.

I can not speak for other sections of our country, for no doubt soil, climate, etc., make a great difference, but here in our lime land Sweet Clover is fully appreciated and much valued as a feed, pasture, and land enricher.—A. B. Brown, Sybil, Ala., in Gleanings in Bee Culture.

CLIMATES FOR TOBACCO.

Climatic conditions have a great influence on the quality and aroma of tobacco, and it is said that the plant is more sensitive to meteorlogical conditions than the instruments used for taking records. In a hot climate the leaf will be gummy and aromatic; in cooler climates the tendency is to thinner leaf, with less aroma. Where, however, the rainfall is heavy in a hot climate with the poor conditions of soil, the leaf is thin, as in Sumatra. Dry weather, from the topping stages of the plant, is favorable to the development of the oxydizing enzyme, which bears such an important part in the curing and fermentation of the leaf. If dry weather during the ripening of the leaf is accompanied with dews at night, the tobacco will be gummy, and cure well. Dry, hot weather causes the leaf to be thick, and tobacco grown in a humid atmosphere, or under cover, will be thin. Very wet, cold weather in the later stages of growth will cause the leaf to be bitter, and cure badly. The deduction therefore is, that tobacco will thrive best in warm climates, with sufficient rainfall to keep the plant growing to the ripening stage. The hot, or cooler climate, together with soil conditions, determines the type of tobacco best suited to each locality.



San Dimas Citrus Nurseries

Biggest in the World

Being the largest exclusive growers of orange and lemon trees in the world, it stands to reason that we can give better service in the way of good trees than any other similar establishment. Our trees won the gold medal at the Pan-American, St. Louis World's Fair and at the Portland Exposition. Can we send you our catalogue? Correspondence solicited.

TRIMMING THE TREES.

Although it is too early for a general pruning of the citrus orchard where it may not have been previously trained up in the way it should go, yet it is a good time to cut off all slender growth that may have been nipped by the frost both on account of looks and for the good of the tree itself. Every twig should be cut off to where the wood shows perfectly sound. It is also as good a time as any while going over the orchard to look into the interior of the trees and remove all dead growth. Many of the smaller twigs that performed a useful function in the growth of the tree have been entirely superseded by a newer and thriftier growth, the result of which is many of the small twigs inside are dead. They are doing no good now in the tree and are harbors for spider webs, dead leaves, dust and other forms of rubbish. They also impede a free circulation of air, which, when dry and hot in the late summer, is unfavorable to the spread of black scale and other forms of parasitical insects. These dead twigs are no indication of an unhealthy condition of the tree, but are natural tq a more advanced stage of tree growth. Their removal will also facilitate spraying, should such an undesirable contingency arise. Time spent now at this leisure time of the year will be very profitably spent, and may even tend to an increased crop of fruit which will have a better chance of early maturity.

WORK IN THE CITRUS ORCHARD.

The rains that have come in liberal quantity of late will relieve the grower of much anxiety, expense and work. The rain has come with a good promise of more and the orange grower can afford to sit down and wait.

Nothing needs to be done in the orchard by way of cultivating or plowing until February, for in the prospect of more rain shortly, cultivation at the present time seems like throwing labor away. Wherever the gropnd is any ways sidling or at right angles to the method used in irrigation it will be a wise precaution to run water furrows to take off any surplus rain that may fall, to prevent washes that may interfere with the grade in irrigation. These should be run often enough so that each furrow will be ample to carry off any surplus that may fall. Those who have been running the subsoiler will have less occasion for this than others who have not. The deep subsoiling presents a much larger surface for seepage than otherwise. Orange picking from now until the end of the season will take up more or less attention as the season advances. The cessation of work in the orchard will give time for this and for any other alterations and improvements that may be desired.

While we have been going on of late years planting out citrus fruits with but little care seemingly as to what it was so long as it was a tree, a change is coming over people's ideas, as it is seen more and more that in the near future only first-class fruit in every particular is likely to bring renumerative prices. Closely akin to the same subject is that of delivering the fruit in first-class condition to the packer and thence on to the consumer. The packing houses are taking up this side of it and cautioning their patrons to be careful in the handling of the fruit, in picking and hauling. This necessity has arisen from the fact of so much damaged fruit having been found on arrival at its Eastern destination. There has, however, been a direct cause that was not suspected at the time and it is probably a near relative to splitting.

It has long been known that the navel orange has always had a tendency to decay at the navel end. Two oranges growing on the same stem side by side, one of them apparently fully ripe and highly colored and the other only partially ripe, present an enigma to the novice why they do not both ripen together? They usually do but in the case under consideration an examination of the fruit would show the highly colored specimen to have a black spot about the base of the navel. This trouble has been greater this year than usual and appears to develop quite rapidly and cause decay in a short time. It will cause the fruit to decay in the packing house for the short time that it stays there. It has been found that the large percentage of decayed on board the cars has been due to this disease. It does not seem to be caused by any fungus but rather by an undue and unequal pressure at a time when the orange is at the most active time of growth, causing a mechanical injury.

When these oranges get in a car of oranges closely packed it will then affect the other oranges in close proximity, and in this way the trouble is increased. In decay there are always present fungus growths which pervade the car affecting all of it by depositing spores on and in the boxes of sound fruit that increases very largely when favoring conditions of heat and moisture are present. Experts can usually tell in packing the affected fruit and throw it among the culls.

Splitting and this rot probably arise from the same cause which is an unequal expansion in the growing fruit which causes this trouble and loss. As to the remedy, none has so far been suggested.

HINTS ON MIXING ARTIFICIAL FERTILIZERS,

Besides a general understanding of the functions of manure, and a knowledge of their differences in action, there is still a necessity for some information as to their handling before sowing.

Nitrate of soda should never be sown at the same time as the seed is sown. On account of its immediate solubility, and the fact that it already is in a form in which plants use it, the nitrogen is liable to quickly leach out of the ground, and be removed in drainage waters. Under these circumstances, nitrate of soda has come to be generally used as a spring top-dressing, at which time there is an abundant root growth, and the nitrogen is made use of rapidly by the growing crop.

Sulphate of ammonia should never be mixed with lime or any manure containing lime, such as Thomas' phosphate or wood ashes. Lime drives off the ammonia, and the quality of the fertilizer is thereby lowered by ignorant handling.

Superphosphates should not have lime in anv form added to them for any purpose, nor should superphosphates and Thomas' phosphates be mixed on account of the lime present in the latter. Bonedust and superphosphate may be mixed without danger. Gypsum may be added to most fertilizers without any way lessening their action, in fact, the addition of gypsum may add materially to the productive power of many fertilizers.

Slowly soluble manures are best sown some time previous to the crop. Lime should always be sown in the early winter, and be harrowed in rather than ploughed in.

Never sow either seed or phosphatic fertilizers within at least a month of sowing lime.

The Southern California Fruit Exchange is doing good work in this market as far as shown on the surface. At any rate no ugly charges and rumors have been circulated regarding it. There may be things going on quite as reprehensible and quite as likely to cause critisim and result in loss to shippers as there are in other directions, but when considering the influences at work in this market or any other it is only possible to point to those which are known and which have resulted in known injury.

There is a splendid market here for all the good fruit California can send. New York wants oranges, plenty of them, but wants them good. It does not want green, immature, wilted and otherwise poor stock. Moreover, it will not buy them, and if they come here every one must expect to lose by them. It isn't a question of supplying the market with fruit. It is a question of supplying the market with good fruit.—New York correspondent Los Angeles Sunday Times.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

CLIMBING KAISERIN AUGUSTA VICTORIA.

This is the grandest acquisition to the climbing rose family yet produced, and is unquestionably the very best climbing white rose in existence.

We have yet to hear of a single complaint or disappointment regarding it. It originated in Wilmington, Del., and the original plant in a four-inch pot was sold for the sum of $500. A very strong, thrifty grower, free from disease, unusually pretty foliage, and the flowers produced on stout, long stems. Although a Hybrid Tea, it is one of the best bloomers we know of for the entire year and will produce more flowers than many of the Teas or Noisettes. Be it remembered, at the same time, that it is perfectly hardy even for cold sections. The flowers are identical in every way with its parent "Kaisern Augusta Victoria" which is well known by all as the best white ever-blooming bush rose grown. The flowers are exquisitely grand—all of them—perfect in shape, size, substance, fragrance, lasting qualities and fullness of flower; bloom will stay on the plant remaining in perfect condition longer than any rose we know of. In this State during trying hot and dry weather so many of our best roses go to pieces at once when full blown, but not so with "Kaiserin;" it opens up full and broad, petals reflexing and rolling back until it assumes the appearance of a perfect blossom of the Camellia. Words fail to do this grand rose justice; to be appreciated it must be growing and blooming at your home.

BEAUTY SPOTS ON THE FARM.

There are odd corners and waste places on almost every farm, unfit for general cultivation which could be converted at small cost into most delightful and picturesque spots. Of course, all rubbish, such as brush and loose stones should be cleaned off and stones utilized either on this spot or a similar position, in making a rockery mound. Then sow the seeds of some hardy grass—blue grass will do, or any other you like.

Now see that you get plants, shrubs and vines that are suited to the location and the amount of care these spots will get. If the space will allow, by all means have a few shade trees. Some of our wild plants might be used in those places most liable to be neglected; we have plenty of native plants equal to many in cultivation and they will generally stand greater neglect. Place these in out-of-the-way nooks, where they will surprise those who will pass by the place.

Vines can very often be used most efficiently in the beautifying of wild spots. Their twining or pendulous habit of growth renders them free from the stiff appearance which the other plants and trees too often possess when improperly used. For rather extensive places, the more vigorous growing vines should be used to climb over old trees, fences, stonepiles, or unsightly out buildings. The English Ivy is excellent for such purposes, as are the Boston Ivy and Virginia Creeper, though both the latter are deciduous. A variety of shrubs should be used and planted in clumps, with the taller and larger ones in the rear—the lowest down in front. A little thought and work will soon make a great change in the waste places of the farm, and render every foot of soil either useful or beautiful.

HOW TO IRRIGATE A GARDEN.

Two things rule in the garden use of water; quantity and method of application—and they rule jointly; neither can displace the other without reducing desirable effects. The quantity of water must be adequate for deep penetration: the method must be that which carries the water to the roots with the least loss by evaporation and the least puddling of the soil following such application . Obviously the secret of garden irrigation is the use of as much water as the soil can hold without actual saturation and recourse to watering at as long intervals as is possible without its drying out. The daily hosing may be cleanly and refreshing in a dusty locality, and worth the trouble from that point of view, but it is not a satisfactory irrigation to secure thrifty growth of plants. One good soaking a week or a fortnight, according to the hold which the soil has on water and the thirst of the air to remove it, is incomparably better than the frivolous flirting of the hose which most amateurs are apt to indulge in. For this reason the ditch along the bed or border from plant to plant and the freshly made basin around isolated trees and shrubs, with a small stream of water running in the ditch, and the basins filled from the ditch or from the open hose are ways of garden irrigation which should be employed as widely as posible except for the lawn. The true method for the lawn is to allow the hose or revolving sprinkler to stand in one place until the ground is thoroughly soft and wet to a foot or more in depth.—E. J. Wickson in Sunset Magazine.

TREES ON THE FARM.

Why do some farmers live on a place for years without any attempt at beautifying it? Is it necessary that everything you grow should be eaten or sent to market? Many fathers wonder why their boys will not stay on the farm (the girls, too, for that matter), wonder why the good housewife is discontented, looks old beyond her years and seldom smiles. They do not seem to realize that this inexcusable neglect finally becomes a disease which afflicts all the household, and occasionally the neighborhood.

It is this class of ancient settlers who for twenty years have been trying to sell their worn-out fields and go elsewhere because their boys have left the ugly old farm and gone to the penitentiary. Some of the settlers in our own State need a little touching up on these lines of general interest. There is a great opening for improvement work in many of our rural districts. We have too many treeless farms and cheerless dooryards. The appearance of every farm should be inviting, not inhospitable.

The most beautiful forms and effect of landscape decoration produced in growing evergreen trees can best be obtained on the broad acres of the farm, where their symmetrical of a city lot. They should not be set where, on natural development, desirable points of view will be obstructed. Neither should they be planted so that their branches touch each other at any stage of growth, except where a windbreak on the farm is contemplated.

The Oldest Nursery in Southern California
Established 1868 by the Present Owner.

Palms, Pines, Acacias, Cypress, Camphors, Eucalyptus, Guavas, Budded Loqnats and all kinds of Ornamental Trees. Be sure and visit the Nurseries. A cordial invitation to all. Nurseries, 200 yards west of Loara Station, S. P. R. R. Our fine Illustrated Catalogue free. Write for it.

In the Vegetable Garden

POTATO SOILS.

Potatoes grow on a wide range of soils, but those in which either sand or clay largely predominate are not desirable. Potatoes prefer a cool, moist, mellow soil, and it must be well drained either naturally or artificially. These conditions can usually be secured in a sandy or gravely loam if rightly managed. There should be enough coarse material in the soil to insure friability and enough silt or clay to insure water holding capacity. An abundant supply of humus is desirable in soils of any grade. It helps to make the stiff soils more permeable and friable and the loose soils more retentive of moisture. In both it is an important source of plant-food, while its presence favors the bringing of the minerals of the soil into available condition.

The physical texture of light soils is favorable for potatoes and if suitably fertilized they will produce larger crops than heavy soils. The potatoes grown on light or medium soils are also usually of superior quality to those grown on heavy soils.

A field having a mellow loamy soil on one part and changing to rather a heavy clay loam on another was planted to potatoes. The whole field was well fertilized and tilled, the different soils being treated alike. It chanced that the first potatoes to be harvested were taken from the area having the lighter soil. These potatoes were furnished to customers who pronounced them of excellent quality and at once placed orders for their winter's supply. These orders were filled with potatoes taken from the area having the heavy soil and proved to be of very inferior quality, to the annoyance and disgust of both seller and buyer.

THE POPULAR TOMATO.

The tomato is one of the few garden vegetables of American origin holding rank as a commercial crop which has come into general cultivation within the last century. This plant because of its relation to the nightshade family, was for a long time held in disrepute by gardeners and people generally.

For at least a century after the tomato was more or less familiar to botanists and gardeners it was very sparingly cultivated, and when grown at all was used chiefly as an ornamental plant. Its cultivation was, therefore, markedly delayed, and it was not until after the strong prejudice that the tomato was poisonous was broken down that its cultivation began to attract attention and its use became general.

The cultivation of the tomato in England and the United States came much later than it did in the countries bordering on the Mediteranean. Climatic conditions undoubtedly had much to do with this. Because of the warm climate and otherwise congenial conditions existing in the Mediterranean countries the tomato flourished there. In England, however, because of the comparatively short season and small amount of heat during the growing period, the cultivation of this plant gained slowly. Even now the cultivation of the tomato in Great Britain is chiefly confined to house and protected walls. In the United States after the plant was once introduced and its poisonous effects were discredited, its cultivation grew rapidly, and now we find it among the most generally cultivated of our garden vegetables.

ONION SEED.

Seed should purchased from reliable firms, even though it may cost more, for it always pays to get good fresh seed. Cheap onion seed is liable to be poor and may mean mixed variety, lack of uniformity in crop, or the production of scullions. Farmers and gardeners frequently buy their seed in the small packets which are sold at the local country stores. This is not a good practice, as such seed is liable to be quite old. Onion seed is slow to germinate and the little plants are delicate and slender-rooted at first. The fresher and more vigorous the seed, the better the germination and the stronger the plants. The germinative vitality of onion seed decreases quite rapidly with age.

THE FARMER'S VEGETABLE GARDEN.

The purpose of the farm garden is to supply the farmer's family with a succession of vegetables throughout the year. It should add diversity to his table and be primarily of use rather than profit. Earliness, productiveness and shipping quality, which are so important in the case of the market gardener, are of less importance with the farmer than suitability to his personal tastes. The farmer should grow the vegetable he likes and should provide these in abundance.

The garden should be located near the house. To be at their best, most vegetables should be used very soon after they are gathered. The garden will be appreciated most if it is not far from the kitchen, not only because the vegetables may be used fresher, but also because the products of the garden will enter more largely into the daily bill of fare, if they are within easy reach.

GARDEN TILLAGE

By the proper cultivation of the garden we accomplish three things: (1) The weeds are kept out so that they do not shade or take away valuable plant food and moisture from the plants which we desire to protect. (2) The surface soil is brought into the best condition to resist drouth; that is, into the best condition for availing itself to the utmost of the stores of water in the subsoil and to prevent evaporation of this water from the surface soil. (3) The stores of insoluble plant food are made soluble by the chemical action and fermentation, which are increased by loosening the soil, thereby letting in the air.

SALT FOR ASPARAGUS.

The application of common salt as a manure was long considered one of the essentials in asparagus growing. With few exceptions the books on gardening written by practical men some years ago recommended the liberal use of salt. The greatest benefit was claimed to be on old plantings.

As to the value of salt for asparagus, opinions differ, not so much in the matter of its value as a direct fertilizer, but in regard to its indirect value. The present trend of opinion seems to be that it is of little if any value, even directly, and by no means necessary.

CAULIFLOWER SEED.

No more important element enters into the success of the cauliflower crop than the quality of the seed and to the seed alone is often due the difference between success and failures, profit and loss. The best seed that can be secured is the cheapest at any reasonable price, and it should always be obtained from a well known reputable seedsman.

The standing of the seedsman is the only guarantee the trucker has that the seed is true to name and selected from the best strain. Aside from the remarks above, the variety does not count for so much as does the care exercised in selecting the seed of that variety. The cauliflower is very prone to deteriorate and unless the most scrupulous care is taken in selecting the seed, the variety will degenerate rapidly.

Cauliflower seed is grown to some extent in America, but most of the seed comes from Denmark, Germany, and Holland and the best from the the first named country (Denmark). An ounce of seed will generally give about fifteen hundred plants suitable for the field. If an ounce of seed will give about fifteen hundred plants and if they are set in the field, 2x3 feet, 7260 plants will be required or between four and five ounces for an acre.

The seed should be purchased some time before required for planting and tested.

Better Orange Prices—The New York market shows normal strength again. The bad shipment of oranges spoken of last week has been taken care of and the probability is that no more chances will be taken by interested persons to send forward defective fruit,, so severe was the criticism on the shipment that broke the market two weeks ago. Word come that the demand for oranges is increasing steadily.

The orange is fast taking the place of the apple, which up to within a few years has been the universal fruit. And the more growers and others interested can make them the universal fruit the better it will be for them.

In the market and from push carts, in New York, apples cost quite as much as oranges. Later when the height of the orange season begins, it will be cheaper to buy oranges than apples. There is a good deal 'of argument throughout the East as to which is the better fruit, but he or she who has eaten a fully-ripe California navel and followed it with one of the apples procurable in the city stalls will no longer have a doubt as to the better fruit to buy. His answer will be complete and emphatic, and it will be for the orange.

This is going to be a great year for oranges. Florida fruit is out of the way and the market is clear for the Califorina shipments. All that seems necessary for the California shipper to do is to keep fruit up to the standard, otherwise it will not sell and the shipper will be the loser. A well known commission man who handles only the best of fruit, in all grades, states the matter thus:

"There are some, perhaps, who do not know or care what the fruit is so long as it is an orange, but, happily for all interests concerned, that contingent of consumers daily becoming less numerous. There is now a much larger constituency than ever before which understand what a good orange is and appreciate it when they get it. Of course, this in the product of educative influences which have come about through constant shipments of better and better fruit. When however, some one makes the mistake of shipping poor fruit it creates a bad impression and afterward it takes several days for the market to recover from its injurious influences."

There has never been a time when the outlook was better for the citrus grower than it is at the present time, for the reason that the demand is greater. It has seldom, if ever, been excelled at this season of the year. It is remarkable for the season and when it is considered that the Florida crop has been almost wholly consumed there is reason to congratulate themselves that California is coming forward under such favorable circumstances. It will have the market to itself at the best season of the year, when there is no other fruit that will compare with it and when there will be no other fruit that can offer effective competition.

If the selling interest is made to understand that indifferent fruit can not be hurled on the commisisoners with any success, hereafter, the market will remain firm to the end for the indications of wider distribution are manifested to a greater degree than ever before known. So taking conditions all through there ought to be a widely increased sale for everything that is worthy of sale and there ought to be more and better oranges than ever before to supply this new possibility of sale. If there is they will be taken. If there is not some other variety of fruit will be given preference.

* * *

Growing Oranges in the North—We have been surprised to note the fact that some of the best oranges grown in California, so far as flavor is concerned, are produced north of the Tehachapi. There, too, the citrus crop matures about two weeks earlier than it does in Southern California. In support of ,this statement we have as authority the Tulare Register which notes that a citrus grower, "Mr. Parker Whitney, who has an especially favored locality in Placer country well sheltered from chilling winds, this season has made the first shipment of new fruit in the state, in the middle of October. followed by shipments from Tulare citrus section.

Shipments this year from Northern California continued right up to New Years by which time the crop from Southern California began to be harvested. In this connection we might say there is something peculiar about the Northern California citrus crop that the eastern man finds it difficult to understand and that is that from three hundred to six hundred miles north of Los Angeles, oranges ripen from a month to six weeks earlier than in the south. In the east there is a decline in temperature of about one degree for every degree of longitude so that the north is very much colder than the south. In California this is not so. Our temperature is influenced by the ocean currents and there is little, if any, difference between the northern and southern climate, outside of the mountain section. The greater interior valleys are enclosed on the one side by the Sierra Nevada range and on the other by the coast range, the latter shutting them out from the ocean breezes, and rendering the contrast of temperature in those sections directly opposed to the ocean. In the great orange section of Southern California the valley is swept by cool ocean breezes in the afternoon and there is a sharp contrast between day and night, which has the effect of checking the growth of the fruit and retarding its ripening time.. This is not the case in Northern California and hence the fact of the 'earlier maturity of the orange crop. The Eastern market looks on the Northern California orange as especially of fine flavor and the fact that scale does not infest the to the extent it does in Southern California makes the subject of citrus culture one of much interest to Easterners seeking a location in California with a view to entering the fruit industry.

* * *

Value of Good Roads.—At the possible expense of being called "a good roads crank" the Cultivator desires to call attention to the necessity for some thorough road work in the country at this time. A trip by wagon will impress the observer with the point that in many sections it appears the roads have not been worked for two years. They are full of holes, uneven and abominable. Farmers can not use them to advantage and a buggy is practically out of the question.

It would appear that residents in these districts ought to do something to put the highways in repair. The Supervisors will not help a district which will not help itself and the longer the roads are neglected the worse becomes the situation.

While this topic is in hand attention is called to a recent bulletin from the department of agriculture, in which it is stated that a general improvement of roads in the farming districts would mean an annual saving of $600,000,000 to the owners of the farms. This astounding figure is at least worthy of study by the farmers of California.

The department, under the direction of Secretary Wilson, has been devoting a good deal of study to the question of good country roads, and some of the conclusions which it has reached are of interest. It is estimated that it costs the farmers $960,000,000 a year to move their products to the railway stations. The distances to be traversed vary greatly in different sections. The minimum average is four miles, in New Jersey. In Arizona the average is sixty miles, in Utah thirty-eight miles and in Wyoming forty miles. It is supposed to cost about 25 cents per ton to transport farm products a mile, and it is estimated that two-thirds of the present costs might be saved if good roads were universal.

This immense gain, says the department bulletin, is not to be had at a low rate. There are 2,000,000 miles of roads to be developed, and they would cost from $3000 to $5000 a mile. The average may be in the neighborhood of $3000 a mile, which for the $2,000,000 miles of road means $6,000,000,000. In New Jersey stretches of Telford roads have cost as much as $10,000 a mile, but the cost has been a good deal reduced lately by the use of better machinery and more economical methods. But a road that costs $4000 a mile in New Jersey costs $5000 in Massachusetts, on account of the differences in topographical conditions. In Tennessee some roads have been made with convict labor as low as $225 per mile, but New York paid $4500 per mile for a road with the same sort of labor, which would have cost $9500 with free labor. So it will be observed that there is a wide margin of cost in different sections. In general road making is costlier in the North, owing to the greater severity of frosts and freezes.

In Connecticut the system of state help adopted some years ago has proved very successful. Under it the state provides the engineers and the appliances and pays 66 per cent of the cost, the other 33 being levied against property located in the road district.

In California we have no state law but the legislature of 1905 appropriated $32,000 for the construction of 75 miles of specified country roads. It should have been $100,000, or even more, and the country roads should be the ones to first demand the attention of the authorities. The farmers must help themselves and they can get the legislature to help them if they show a united front in demanding that our State authorities appropriate sufficient funds each year to extend road making over the State.

* * *

Prof. Clarke's Deductions.—The apple growers of Los Angeles and San Bernardino Counties, in session last Saturday were instructed and singularly interested in the address by Prof. Clarke of the University of California, who spoke on "Parasites for Codling Moth."

Widely discussing the moth and its injuries to the apple Prof. Clarke stated that the parasites of the Codling Moth (Ephialtes carbonarious) had done well in breeding jars but as yet had not made demonstrations of their efficacy on orchards. Some time must elapse before this will be satisfactorily made to appear.

Prof. Clarke talked of the use of Paris green for spray showing from a chemical standpoint the cause of its burning trees. He discouraged its use and advocated the use of arsenate of lead in the form of "disperene" which he held may be used without regard to the trees. Two applications are necessary. The first just before closing of the calyx cup of the flower and hte second in twenty-one days thereafter.

An action has been brought in the superior court by the County of Santa Clara vs. the State of California to recover $24,445 alleged to be due the county for the support of aged persons in indigent circumstances.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The carload shipments for last week were two of lemons and four of hay.—Escondido Times.

Six carloads of oranges were the total shipments from Orange during the week ending Jan. 16.

The peach crop proved to be one of the best ever grown in this country, much to the surprise of many orchardists.

The Alta district raisin association is in a fair way to dissolve. Disagreement between members is the cause.

The Cloverdale Citrus Fair pavilion is to be very greatly enlarged this year to accommodate the exhibition this fall.

W. G. McPherson of Orange was in the valley this week after grape cuttings to replace his vineyard that had been recently destroyed by disease.—Escondido Times.

Another concern incorporated here is the Rosario Vineyard Co., capital $50,000, with the following directors: W. T. Wells, C. Hubert, Los Angeles, and W. P. Lewis, New Mexico.

A Kings County correspondent writes: "The orange crop promises fair. Indications point to good prices, which, growers believe, will overcome the loss caused by the splits. The lemon crop is about medium; prices good."

The Ontario Citrus Fruit Association paid out last week $4,543.33 on the Christmas pool for navel oranges. This is at the rate of $1.68 per 100 pounds, and with the final dividend will net the growers nearly 2 cents per pound for all grades.

Among the recent California fruit incorporations are the Edmonds Peycke Co. of Los Angeles, with a capital stock of $10,000, to deal in fruits. The directors are: E .P. Peycke, Los Angeles; F. E. and H. P. Peycke, Chicago; G. W. Pomy and W. D. Stewart.

We have recently had the pleasure of sampling some very fine apples from Escondido. These apples were grown on the mountains to the north of that thriving burg, and are very like the Julian apple, which has a reputation second to none on the coast on in the East either.—Anaheim Gazette.

The Ontario Record is authority for the statement that during the past week the Upland Citrus Asociation sent $8,000 out to its members. On Christmas pool oranges they paid them on all grades an average of $1.90 per 100 pounds, and on the second November pool an average of $2.00 per 100 pounds.

The Mecca Experimental Station is 200 feet below the sea level and comprises fifteen acres. Several varieties of date palm, grapes and figs are being experimented with, also eucalyptus of which the "red gum" is the best adapted to that climate. A great many more fruit trees will be introduced in the coming spring.

For the fiscal year ending September 1, 1905, 617 lemon trees returned Mr. Fletcher $5.099.21 above packing and marketing charges, or the neat sum of $8.26 per tree. Each acre contains 96 trees, hence $792.96 is the return per acre. The total cost of production was $110 per acre, leaving a net earning per acre of $682.96.—Whittier News.

The Simi Land Company, says the Healdsburg Enterprise, are making large preparations in the way of renewing their vineyards to resistant cuttings and setting out additional acreage. This spring 20 acres will be set out and a nursery of 150,000 resistant cuttings is being prepared for the year following. The company now have close on to four hundred acres in vines.

In the past few seasons Valencia late oranges from the Fullerton-Placcentia belt have sold at fancy prices, some bringing over $10 a box. In the past year L. E. Myers has budded in this section about 10,000 Mediterranean sweet, lemon, Australian and Washington navel trees to late Valencias. The budded trees will begin bearing in two or three years, and fruit men say that by that time there may be as great demand for some other variety.

The Chicago Packer urges its readers among the growers and shippers to begin now to arrange for the consigning or selling of their 1906 crops. It doesn't make any difference, says the Packer, whether the shipping season be early or late, April, May, June, July, August or September, now is the time to begin to get in touch with the trade. Decide during the next two months to whom you will ship and then when the time comes shipments will go out without a hitch.

C. M. Brown, manager of the Redlands Golden Orange Association, states: "In all of his 21 years of experience in the orange business in California he has never seen sizes so small and the evidence to him is conclusive on every hand that there is a remarkable short yield of navels this season. In referring to a recent estimate from another source of 38,000 cars for California Mr. Brown says that such figures could have originated from only one of two sources—the blind or the ignorant. Shipments, Mr. Brown thinks, have without reason been rushed forward entirely too heavy. While about 500 cars more have gone forward than last year, as a matter of fact he thinks that figures should stand from 300 to 400 less."

Some months ago a parasite which kills the purple scale, a deadly foe of orange trees in California, was found in China. Many of its eggs were sent to San Francisco by an agent of the State Horticultural Department of California, but unfortunately the eggs did not hatch. This failure suggested an attempt to bring the parasites to California alive in shape to do business, so a number of orange trees were shipped to China from this State, and upon their arrival they were transported many hundred miles into the interior, to the province that is the home of the enemy of the purple scale. There the parasite made its home in the imported trees, which were then taken back to the sea coast, and after a time placed on a steamer for San Francisco.

They reached that city in good condition after their long journey by sea and land, and are now being watched with constant care. If the parasites on them live and thrive the problem of relief for the Southern California orange groves has been solved. If not a second shipment of trees to China will be made.

AGRICULTURE.

Colorado now has 85,000 acres under beet sugar cultivation, and the value of the production in that State last year amounted to more than $7,000,000.

Receipts of hay in San Francisco for the past week amount to 2,450 tons, or somewhat less than for the previous month.

Thursday, January 25, is the day for the distribution of 11,000 acres of land in Tulare County to members of the California Home Extension Association. Within a week after the drawing it is expected that not less than 1,200 people will have made the trip north and settled in and around the proposed town of Alpaugh.—Tulare Register.

The Hemet News state that F. T. Knewing, the London representative of the Hemet Land Company had arrived with a party of fourteen prospective settlers in the Hemet Valley. This is the third such party that Mr. Knewing has brought out with him. Mr. Knewing further states that a number of others will follow in a short time, who were not quite ready to leave England at the time of his departure.

One day last week forty-eight carloads of vegetables were sent east from Los Angeles. The shipment was worth $15,000. There are in Southern California 3400 acres devoted to the production of the celery crop, The shipments of this vegetable in the month of December brought back to the section the sum $160,000. Shippers send out of Southern California annually something like 500 carloads of cabbage and 300 carloads of cauliflower.

Owing to the rain in Monterey county, work is going on actively to prepare for beet planting. The storm left 1.21 inches of rain making 3.46 for the season. Previous to the rain about 1200 acres of beets had already been planted, but the rain has now put the ground in such condition that what is planted will grow quickly, and planting will now go on fast. This puts an end to the fear that the sugar season will be late this year. The American Beet Sugar Company expects from 16,000 to 18,000 acres of beets this season.

Governor Pardee has written a circular letter to the directors of the State Agricultural Society in which he tells them bluntly that the State Fair must be brought up to a higher standard if any further help is expected from the State treasury. He says that the State Fair is financially flat on its back, that funds are exhausted, and that the indebtedness incurred in fitting up Agricultural Park near Sacramento greatly exceeded the estimates made by the governor and the board, and generally indicates his dissatisfaction with the way in which the State Far has been run. The Governor is right.

LIVE STOCK.

During the year ending October 1, 1905, Tulare County produced 1,735,888 pounds of butter.

The San Jacinto Creamery and ice plant, costing several thousand dollars, burned down this week.

The Imperial Standard says: Joseph Hanson has sold over $800 worth of hogs since Thanksgiving.

The Dinuba Creamery Association filed articles of incorporation Thursday in the office of the county clerk.

Grass and grain are springing up in Napa County with wonderful growth. Stock is already being turned out to pasture.

A man in Chicago boasts of a cow that barks like a dog. It is different from the ordinary Chicago cow which gives milk like a pump.

At Compton, Los Angeles County, is reported to be the largest cheese factory in the world. The output of the institution goes all over the country.

Along the San Gabriel river, stockmen have lost cattle by the recent flood. The water rising so fast at night, that they could not move them to a place of safety.

The dairymen of Alameda County, at least in parts of it, anticipate considerable raise in the price of butter within the next ten days. Milk cows have not been doing well as to volume giving lately.

Inasmuch as all kinds of live stock show higher average prices for this year and there has been so much increase in total volume of receipts, the year's valuation will show an increase of around $$20,000,000 compared with 1904.

Crop prospects in Modoc County, so far as can be determined thus early in the season, are promising. There is plenty of snow, which insures a good range for stock, and gives the farmers ground to hope that crops will be excellent.

The rain which came recently was most welcome to the farmers, and especially to the stock men, as feed was becoming very scarce on the hills. In fact we learn that some of the stock had to be killed on account of the poor condition.—Tulare Press.

Here is an item which shows that the stock business has not gone all to smash throughout the country at large, though at times badly demoralized:

The year's' receipts of horses at Chicago will total close to 127,000 head, which shows that the automobiles have not yet put the horse-raisers out of business. There were 18,448 horses received in March, which smashed the previous record. Hog prices were about 25 cents higher than last year.

MISCELLANEOUS.

Sunnyvale starts the new year with a new bank, a new band, and a new department store.

C. C. Wright, author of the Wright irrigation law and a very able lawyer, died last week in Los Angeles.

The Ontario School district will vote on a proposition to bond the district for $60,000 to build school houses.

Last Thursday afternoon the new Odd Fellows' building in Lemoore, dedicated less than one year ago, was gutted by fire.

The American Produce Co. and L. Coatena & Co., two large fruit and produce houses of San Francisco, have consolidated.

The Courier says Petaluma business men have organized a progressive or commercial club to exploit the advantages of Petaluma as a place for settlers.

The Sonoma County Farmers' Mutual Fire Insurance Co. showed $600,462 insurance in force at the beginning of the year and $354,569 written during the year.

The merchants of Visalia became alarmed at the deluge of rain falling in that town last week and many of the stores had their stocks removed from the basements.

The official count of the votes cast at the bond election held at Santa Ana January 10 shows that instead of carrying the street bond issue of $25,000 lacked 30 votes.

California has five insurance companies among a total of ten doing business in California, with $7,000,000 of insurance in force at an average cost of 20 cents per $100.

Amelia Charlotte Johnson, a native of Sweden, last week at San Jose filed her declaration to become a citizen. She is the first woman in the history of Santa Clara county to apply for citizenship.

A new political party has been organized at Bakersfield called Public Ownership Party. Its slogan is to be "Public ownership and operation of railroads and all other necessary public utilities."

The University of California besides furnishing the youths of the State an education free from charge, is now to go a step further and secure positions for those who graduate from the institution.

Geo. W. Hamrick, an old and well-known resident of Butte County, was found dead this morning on the mountain road near Magalia, that county. He had evidently fallen from his freight wagon.

There is a persistent rumor in university circles about the bay that President Benjamin Ide Wheeler of the University of California is to be Dr. Harper's' successor as head of Chicago University.

Valley Center, Sonoma County, has some of the richest lead and zinc mines in the State. A strong company has been formed and the immediate development of this rich ore will commence at once.

Live Stock and the Dairy

CALF RAISING.

In the dairy herd the calf is removed from the cow's presence after having its toilet made by the rough tongue of the mother and when it has received its first nourishment. This is certainly to be preferred to leaving the cow and calf together for several days. Some of our men have been tender hearted and would take the calf away at once and attend to its needs, as they thought it harder for the cow if she washed and nursed it as her natural love was aroused. However, this may be, it is customary to allow the calf to nurse a few times, though it is easier to handle if the calf is removed and the cow milked a few times by hand and the calf fed three times a day with the new milk. The feeding of the first milk is important, as nature intended it to cleanse and open the intestines of the newly born calf. Indeed without the first milk of the dam to feed it is difficult to raise the young of any kind, where they survive after the death of the dam; they are puny and slow to start growth. The first days after calving the cow should not be milked dry as there is then danger of a chill and milk fever if the udder is permitted to be emptied. When the rush of milk sets in more must be milked out, and by the third day nearly all should be drawn, and as soon as the cow goes back in the herd milk clean.

Gentleness and patience are required in feeding the calf. The calf is left over night without milk, then a shallow pan is used instead of the deep pail. The calf soon drinks when it cannot choke itself as in a deep pail. In the old fashioned way of using a deep pail the calf drew the milk up its nose, greatly to its alarm, and then proceded to blow it out in spray into the feeder's face, who often, in his disgust, laid a far from gentle hand on the calf's head as he again plunged its nose deep in the milk.

* * *

In a registered herd the calf has its ear tag put in before it is removed from the cow box stall. If there are grade cows as well as pure bloods in the herd, it is well to snip off the point of the other ear of all calves dropped by grade cows, then neither by mistake nor malice can the herd be mixed as to grades. In a large herd there will always be some calves dropped when they are not perfect. When they are first separated from the cow examine the heifer as to udder and teats, some will have only two or three teats and others will show the teats grown together. These as well as weak animals should be put in the veal lot, for it never pays to raise weak animals when it costs no more to raise strong ones,

The young calf when removed from its dam must have a warm clean bed in a dry place out of the wind and where it will escape the chill of early morning. After the fifth day the dam's milk has become fit for human use and the calf can be fed from the mixed milk of the herds. It should be fed warm twice a day. After ten days put in skim milk by degrees so that in three weeks it will be receiving all skimmed milk. To restore the fat removed from the skim milk, add oil cake meal jelly. This is made by cooking oil cake meal in a small quantity of water and adding at the rate of four tablespoonfuls to each gallon of the skim milk. The oil meal can be cooked and kept for several days, add a little salt to it in the cooking.

The secret in successfully feeding skim milk to calves is always to remember that it is not poor nor weak food, but has all the nutriment of the new milk except the fat, and in a growing animal this is used to keep the system open or active rather than to make fat. If the skim milk is fed warm it does not seem to matter if it is a little turned. Do not give too much! that is the error that we have had to contend against in our feeding.

The men think skim milk mighty poor feed and load the little calves that have had a gallon of new milk a day with two of skim milk. In a little while the calves have the scours, and usually die. A dose of castor oil, some milk, eggs, and whiskey, an eggnog with salt instead of sugar, (then the calves not the men will get it.) Clean the calves, using a disinfectant as lysol to wash off any filth, put them into a clean house in a clean corral, separating the sick ones from those not as yet attacked.

In the warm skim milk, with the oil cake, use as much Hansen rennet tablet as the given amount of milk would require for cheese, about one quarter of a tablet to each 25 pounds of milk. Feed the milk well warmed every four hours, giving only half rations, some of the calves will have to be drenched, but it pays to do so for I have had them recover which were very far gone. The rennet can be dissolved in a bottle of water and added just as it is needed as it acts promptly in curdling the milk.

Cleanliness in all the vessels and in the skim milk itself is of great importance in calf feeding; they are as sensitive as children. It was said at the University Farmers' Institute at Berkeley last month, that the calves were nearly always infected with tuberculosis from the milk, that indeed if this condition could be eliminated by weeding out tuberculous cows from the herds of the State, the disease would be controlled as far as dairy cattle go.

* * *

A little manger with a mixture of three parts bran, one of oil cake meal, seasoned with salt should be within reach of the calves at all times. When skimmed milk was scarce after the calves are three weeks old it can be stretched with hay tea. This is made by infusing alfalfa or clover hay in water. A clean barrel or wash boiler is filled full of hay and then water is poured on. In the barrel the top is covered and the steam hose put in to bring it to a boil. If the wash kettle is used to put on the stove, let boil five minutes, then set aside, covered, to draw out the strength, use this instead of the milk. Beginning gradually and it can be made to take the place of the skim milk; add the oil cake and do not over-feed. One word of caution to add here is that hay infusions are as good a culture for bacteria as boullion, so that a teaspoonful of fresh lime water to each feed does no harm. I raised calves on hay tea for two winters before the silos were rebuilt, for then the milk supply used to drop down heavily, One time for two months, when oil cake went up in price, I used second grade flour for the gruel with the hay tea, the calves seemed to be as healthy but did not look as slick as when they had the oil meal.

If any difficulties arose I always found carelessness, the pans or pails were not sterile, the gruel was sour, or the calves overfed or the mixture was cold. The average man kills the calves by over-feeding, when a calf's sides are level it has had enough; never feed until it has a bay window on each side.

If the calves are to be dehorned by caustic potash it should be done when they are a week old. This is a job requiring care, as the alkali will burn wherever it falls. The hair is carefully clipped from the little nodule that is to be a horn by and by. The caustic is rubbed on, and the calf is held until the caustic dries, otherwise it will rub it over its head where it is not wanted. A little carbolized vaseline rubbed on the spots every day will help heal the burns.

The calf should soon learn to be tied and where there are any number to be fed a house with small stanchions proves a valuable labor saving and controlling device. The man feeding begins to fill a pail with milk, the calves in the house come up and the one that is first puts his head in the stanchion to reach the milk, is promptly shut in, so he goes along the line and the work is done. The feeder sees the size of the calf and then proportions the feed. The calves lay down patiently and nap after they have finished. As soon as they have forgotten the taste of the milk they are released, and fail to suck each others ears out of shape.

Fresh water at all times should be within reach, and it is surprising how much a calf will drink. As the calves grow older they can be fed only twice a day, though if the grass is not young it pays to continue feeding them until they cease to come to the house at ration time.—Mrs. Minna E. Sherman.

HOG RAISING.

A line of livestock work that is closely allied to dairying is hog raising. The value of swine in our State is about $4,000,000. Of these animals about one-third are raised on dairies. Alfalfa makes a good feed for sows as well as for cows, and there is no better feed for pigs than the dairy by-products. Yet we do not raise enough pork to supply our people. Every year about 10,000,000 pounds of pork products are brought into San Francisco alone. Perhaps not all of this remains in the State, but it doesn't make any difference whether we consume all the products that is brought into the State or whether it is shipped to the Far East. If it is shipped, then we are to blame for not securing that export trade ourselves.—E. W. Majors.

PIGGIE'S DECISION.

Little Piggie, cold and weary,
On a night both dark and dreary,
Crept into a stable that was
Filled with warm, sweet hay;
There he lay through all the night
Till again came broad daylight;
Then he wagged his tail and said:
"I like this place—I'll stay."
—Tim Turnips.

Sharples
TUBULAR
CREAM SEPARATORS

WHICH DO YOU WANT?

Tubular or Bucket Bowl?
Simple Bowl or Complicated?
Izzers or Hasbeens?
Waist Low Can or Head High Can?
Self Oiling or Oil Yourself?
Wash 3 Minutes or Wash Thirty?
All the Butter or Most All?
Best Butter or Medium Butter?

Tubulars are different, very different. Just one Tubular—the Sharples. All others make bucket bowls—can't make Tubulars because they are patented. Ask for catalog Q-260.

PERFORMANCES OF NETTIE UNDERWOOD.

Editor Cultivator: Accounts of Nettie's performances at the pail have been published in the Cultivator at different times in the past five or six years, when she has some new demonstration of her dairy ability, and she is well known to many of California's Jersey admirers; but her latest year's test, besides being an official record, is her greatest performance. Nettie dropped her ninth calf December 10th, and started on this official test December 15th, 1904, being at that time ten years and five months of age. The official test shows that for the 365 days ending December 14th, 1905, Nettie gave 10992 pounds of milk which produced 568 pounds of butter fat, equivalent to 668 pounds of butter, 85 per cent. fat. The average daily milk production was 30 pounds. Average daily butter production 1.83 pound. Her highest day's milk yield was 36 pounds, 2 ounces; about two and one-half months after calving. Her lowest day's milk yield was 21 pounds 14 ounces. Her remarkable persistency as a milker will be noted.

She was fed 10 pounds of grain per day during test and all the alfalfa hay she wanted morning and night. Ran on very poor pasture every afternoon from January to May. She had no extra care but ran with the herd at all times. She was not held from breeding to make a large record but was bred May 13th and has carried a calf during the last seven months of her test. She is due to come fresh February 18th. She weighed after finishing the test, 1002 pounds.

The test was conducted under the supervision of Mr. C. S. Burgess, official tester for the American Jersey Cattle Club in Southern California. I have just received a letter from Mr. J. J. Hemingway of New York City, secretary of the American Jersey Cattle Club, saying that Nettie's test has been found correct in every particular, and that it is the third largest yearly authenticated test that has yet been reported to the Club. It is necessary for a mature cow to make 400 pounds of butter fat in a year to be admitted to the Club's Register of Merits. As will be seen Nettie has made 168 pounds more than the required amount. Nettie Underwood is a solid light gray fawn in color. She was dropped July 5th, 1894; was bred by Henry Carlyle, of Orange County, California, of whom I purchased her as a two-year-old. Her sire is Shade's Darling Duke and dam, Virgie Carlyle, who was also a daughter of Shade's Darling Duke. Nettie is very closely inbred in the Coomassie and Pansy families.

Hoping that the above will prove of interest to Cultivator readers, I am yours for "yearly records,"—Guy H. Miller.

BILTMORE'S GOLDEN LAD.

Editor Cultivator: I notice that Mr. C. S. Burgess of Riverside is advertising for sale in your columns, his bull, Biltmore's Golden Lad. As the value of a bull largely depends upon the performance of his daughter I would like to state for the benefit of your readers that we have lately had freshen on our ranch a heifer by Biltmore's Golden Lad out of a daughter of Winksette's Princess. This heifer as far as looks is concerned is a rangy capacious cow with splendid udder and teats and with every mark of a great performer. She has not yet come up to her limit but has already given 30 pounds of milk in a day which with the first calf is not so bad and gives great promise for the future. We are so pleased with the way this heifer is turning out that we have bought a bull calf by Biltmore's Golden Lad out of Winksette's Bell; this cow is now making nearly 2 1-2 pounds of butter a day and we consider her son by Biltmore's Golden Lad good enough to tie up to. I sincerely hope that this bull will fall into the hands of some breeder who has good foundation stock and good methods, as we need just just blood to help build up the reputation of Jerseys in Southern California.—C. W. Leffingwell, Jr.

SILOS IN CALIFORNIA.

The subject of silo-building in California is a growing one among dairymen.

About eight years ago the question of the value of silos began to be agitated. At that time there were very few dairymen in California who knew how to build or fill a silo or had any conception of its value. During one entire year this column of the weekly "Chronicle" was largely devoted to discussion of the silo, the methods of building and filling it and the use of silage in feeding. Now one would no more think of explaining the value of silage than of alfalfa. All intelligent dairymen understand it far better than agricultural editors unless they also happen to be dairymen. Unfortunately many dairymen do not have silos, but if they do not it is usually because they are carrying on business with insufficient capital and so are unable to practice the economics which capital makes possible. In California the profit of dairying depends mainly, assuming the cows to be good, upon maintaining the flow of milk and the health of the animals during that portion of the year when there is no green feed on the ranges. This end can be accomplished only by the use of succulent food and the only sources of succulent food during such periods are soiling and the silo. Both agencies are employed by good dairymen, but of course silage can be had when it is no longer possible to have green corn, sorghum, or any other soiling crop ready to cut. The value of the silo has been very well expressed by Mrs. Minnie E. Sherman, of Fresno, by relating her own experience one year when no silage was provided. She says:

Indian corn can be planted from March to July and mature a good crop. For the past eight years we have put the corn into the silo, excepting one season. That one experience we hope never to be foolish enough to repeat, but we will tell you about it. After selling 150 milk cows and several carload lots of heifers, the milking string was reduced to forty head. The corn sowing was neglected and no silage made for the cows seemed a mere handful to feed. The winter came and it proved cold—the green feed did not come, the hay went short and then came buying of hay and adding oil cake to the ration, still the milk yield dropped down until the cows were only averaging twenty-one pounds daily. Worse than that, they did not look sleek and fat, though they were fed all they should have of the heavy grains. It was the meanest looking lot of cows ever on the ranch. The next spring how the men hustled to put the first crop of alfalfa into the silo for them, and how anxious every one was to see plenty of corn sown. Some of the old hands that had regarded the making of silage with suspicion as to its paying, now became the warmest advocates of the silos. The corn has been planted so faithfully every year since that we have had more than the silos would hold.

DENTITION TEST FOR CATTLE.

At the request of Ohio subscribers we reprint from our issue of Nov. 30, 1904, the dentition test for cattle adopted by the International Live Stock Exposition Co.

The subjoined schedule represents the concensus of opinion of a number who have been consulted in reference to this important subject. It is not put out by the International management as representing absolute accuracy. It is believed that these specifications deal very leniently with feeders; that if the err at all, it is in the direction of giving the feeder the benefit of a doubt.

"Twelve months.—An animal of this age shall have all of its milk (calf) incisor teeth in place.

"Fifteen months.—At this age the center pair of incisor milk teeth may be replaced by center pair of permanent incisors (pinchers), the latter teeth being through the gums but not yet in wear.

"Eighteen month.—The middle pair of permanent incisors at this age should be fully up and in wear, but next pair (first intermediate) not yet cut through gums.

"Twenty-four months.—The mouth at this age will show two middle permanent (broad) incisors fully up and in wear, and next pair (first intermediate) well up but not in wear.

"Thirty months.—The mouth at this age may show six broad permanent incisors, the middle and first intermediate pairs fully up and in wear and the next pair (second intermediate) well up but not in wear.

"Thirty-six months.—Three pairs of broad teeth should be fully up and in wear and the corner milk teeth may be shed or shedding, with the corner permanent teeth just appearing through the gums.

"Thirty-nine months.—Three pairs of broad teeth will be fully up and in wear and corner teeth (incisors) through gums but not in wear."—Breeders' Gazette.

NECESSITIES IN ANIMAL BREEDING.

Our promising stock of Red Polled cattle is widely distributed, one herd here, another there, possibly hundreds of miles between. The herds of milking Shorthorns are scattered around the earth but centered nowhere. How can the breeders of these cattle gain knowledge of one another? How can they measure the breeding power of the parents and different blood lines? The fairs are almost misleading to the breeder of cattle in combining milk and beef. The milk-giving power cannot be measured by the show ring judge, and he must judge on the quality which he sees; hence, he is tempted to select those with good beef outlines, hoping that he may not do injustice to those with superior milking qualities, together with the vitality to transmit both good beefing and milking qualities, together with the tendency to live long and be prolific. An owner of a herd of milking Shorthorns or of Red Polled cattle who is isolated will do well to retain the excellence of his herd unless he has unusual facilities to travel and study the herds from among which he must choose his bulls. Most of such herds have been sooner or later seriously injured as general purpose cattle by the selection of a bull weak in dairy qualities. The herds of these classes of cattle, if they were collected into a few counties, would go forward rapidly to the success which they might merit. And what a blessing it would be to this country fifty years hence if this were now done. Large numbers under similar conditions, where records of prepotency may be kept, compared and used, are necessary in animal breeding. Plans ought to be formulated for the production of a strain of hogs with a very large amount of tender lean meat, abundant fecundity, strong bones, early maturity, large growth from a given amount of food and with sufficient uniformity of color and form to distinguish the breed. All these intrinsic qualities and the facts as to the animal and form should be recorded for future reference.—Prof. W. W. Hays.

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

BROILERS AND FRYERS.

It would seem as if I have almost covered the ground in our talks on hen raised chicks and brooder chicks but one thing I omitted and that is one of the hardest things for the beginner to do is to follow the advice of the old breeders to kill all the weaklings that are hatched or those that have to be helped out of the shell. They should be killed, because they are weak, and being smaller than the others they cannot hustle for their living and usually grow weakly and sickly and affect the others, so it is bad for the others to allow them to survive. However, if you feel that you must give them a chance, put them under a good motherly hen, feed them dry chick feed, give them milk to drink, lettuce and onions chopped, and if there is any hope of life for them they will live. I have done it and wondered whether it was that the natural heat of the hen helped them, or whether it was because there were only a few together.

When the chicks are about six or eight weeks old, (according to the breed,) if they are to be used as broilers the feeding should be gradually changed, because of the strong large frame, that we want for breeders and layers, we want the food to turn into juicy flesh and fat—and instead of muscle we want meat.

Here again it is the proper food that controls the output, we must feed for what we want. Certain elements in the food go to the growth of bone and muscle, while others go to fat and meat and we must "balance" the ration as they call it according to what we want.

Now if we want broilers, we separate them from the others at about six or eight weeks of age—we have been feeding them up to this time on dry chicks feed and twice a day green feed, with an addition to their supper of eggs and bread crumbs or Johnny cake, we now commence at their suppertime to give them a mash, mixed very dry, composed of equal parts of bran, cornmeal, and oatmeal, mixed dry and crumbly. Let them eat all they will before going to sleep, take away the remainder. Continue giving them the chick feed and green feed during the day, but in about five days give them a breakfast of the above mash,, and five days later give the mash three times a day, mixing it fresh for each meal. The reason for mixing it fresh is that if it is the least sour it will cause trouble, and cost you perhaps the lives of many and certainly cost you much more food labor and money, for you will have to feed a much longer time to get them well again.

I would like to explain that sour milk when fed as clabber, or mixed in the mash does not injure chicks, the acid it contains is lactic acid which does not harm them, but when the mash turns sour it is a fermentation that commences and that invariably injures chickens, although it does not hurt hogs.

The broilers should have some heat at night if the weather is cold, in fact it is not advisable to make any radical change in their quarters nor in the way they are housed. Changes are apt to give them a set back, so be careful to make changes gradually and carefully. Broilers should weigh about a pound and a half, but there are now epicures who demand what is called "squab broilers," or chickens as small as pigeons weighing only one pound, these are either younger chicks or else chicks from smaller breeds like bantams which are very delicious.

Fryers should weigh two pounds, and upwards. Roasters four pounds, and up. It takes just about three weeks to feed the chicks for market with this forcing food. This food given three times a day with green food twice a day and a little chick feed left in the litter to keep them busy and amused is all they need; it will make the flesh juicy and delicious.

In England barley meal and oatmeal, equal parts mixed with milk is the fattening food. In France, buckwheat meal, oatmeal and corn meal. The mixture I recommend is corn meal, oatmeal and bran is the one most available in this part of the co[illegible] and the feed that I have tried [illegible]ccessfully.

I did not have a broiler ranch, but as the chickens usually hatch half males, I would want to discard some of them and I sometimes if I was in a hurry, get them out of the way and so make room for pullets would turn them into broilers or capons. It all depended upon what brooder room or house room I had for the stock. It pays to raise broilers if you have a surplus of males, and if you have a market for them at a fair price. I found it cost just about eighteen cents to raise a broiler weighing a pound and a half from the day it was hatched till it was ready for market. The usual price given by commission houses is 16 cents a pound, so that if I sold a commission house my profits

Petaluma Incubators and Brooders
The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?
St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.
And Now Comes New Reward for Merit:

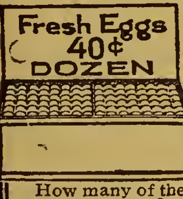
WHY ARE EGGS HIGH?
We all know—because hens are not laying now. But why do poultry owners overlook this chance to make money? It must be because they don't believe our statement that
SECURITY POULTRY FOOD WILL MAKE HENS LAY.
You don't have to take our word. You can be the judge. We can make your hens lay in from 2 to 4 weeks and
WE GUARANTEE IT.
Our dealer in your town will back up this guarantee. Ask him. Will you pass this chance to make money when we take the risk? It also puts sick poultry in healthy condition and keeps them so.
SECURITY STOCK FOOD CO.
MINNEAPOLIS, MINN.



Get on The Egg Road
THE Profit in Poultry Raising is in the 30c and 40c Eggs.
How many of these, per Hen, did YOU get last winter? And are you CERTAIN that you shouldn't have had MORE?
Be CERTAIN THIS winter by using
Purina Poultry Feeds
and KNOW that you are getting EVERY EGG your hens are capable of laying.
Because there is no GUESSWORK about Purina Feeds—they have been tested by feeding different combinations and watching RESULTS in the Winter Season, until, they will make your Hens keep right on laying all winter, no matter how low the thermometer goes.
And you don't have to take OUR WORD for what Purina Foods will do either—for you can prove our claims at OUR EXPENSE.
If the RESULTS don't come, just tie up the bag and write us, and we will return every penny of your money and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer, or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.
This is the Money Back Line——

would only be six cents on a broiler and that would not pay, I never sold to commission men, I had my private customers and never got less than 35 cents for a broiler, and from 50 to 75 cents for a fryer.

It is needless to say that the water fountains and milk fountains were scalded every day and rinsed once or twice besides, the milk was either sweet or clabber. It is best to keep to either sweet or clabber, if you give them sweet skim milk keep to it, do not change or give sweet at one meal and clabber at the next, it may disagree. Some people prefer the sour, I have given both and see no difference but I think my chickens preferred the sweet milk.

EDITOR'S QUESTION BOX.

Ration for Orpingtons. (Mrs. H. M. J.) A neighbor of mine used your food formula for Leghorns with great success, the chickens doing very well, indeed.

Would you please advise me as to a food formula for the Orpingtons? What would you use for a "mash?" I am quite anxious to find a food to make them lay better.

Thanking you, I am, sincerly yours,—H. M. J., Long Beach, Cal.

Answer.—A good mash for Orpingtons for egg making would be two parts bran, one part alfalfa (alfalfa meal) and one part beef scraps or meat meal, with a little salt and pepper, just as you would season your own food. I always advise our readers to get the bulletin on poultry food No. 164 from Berkeley, balance their rations by that because in some localities some foods are cheaper than others. When fowls do not lay well, if they come from a good laying strain it shows that some element of the egg is lacking in their food. The usual lack is animal food and green food. Orpingtons are hearty eaters and if given too much grain in proportion to the meat will grow to fat inside instead of to eggs. Of course they must have grit and shell or lime that has been either made into mortar (old plaster) or mixed with water, not only air-slacked. Skim milk is a great help towards egg production.

See my reply to L. G. W.

* * *

Lime, Greenfood, Dust. (L. G. W., Tropico.) Is there any good plant for forage for chickens which I can grow between walnut trees without doing them an injury.

2. My hens are much in need of lime. What is the best form and way in which to feed it?

3. Is there not something simple and cheap which one can put where the chickens burrow, with which they can practically free themselves from lice, or what simple remedy do you advise?

Answer. The best green food for chicks is clover or alfalfa, but I should think wheat or barley planted between the trees would, followed by a crop of peas. You had however, better ask our botanist—Swiss chard one of the beets is a good green food.

2. A very good and easy way of giving lime, is to mix some lime, after slacking with some sand leave it twenty-four hours to stand then pour it out on the ground, it will form a cake, break a little off with your foot every day, the hens will eat with avidity all they need.

3. You can put into the chicken dust bath any good lice powder, or tobacco dust, or carbonated lime, or even ashes from the stove. Painting the perches with Lee's lice killer also is excellent. These will keep the fowls free from lice if you start with them free.

* * *

Balancing Ration.—(G. B., Upland.) I have a flock of 24 Barred Plymouth Rocks. The morning meal consists of a mash moistened with warm water composed of 2 pounds green alfalfa leaves, 1 pound bran, 1 pound shorts, 1 pound corn meal (coarse), ½ pound meat scraps, [illegible] pound linseed oil cake meal, ¼ pound chopped onions, charcoal, peppers, table scraps, etc.

The evening meal consists of 2 pounds fo wheat, 1 pound Egyptian

Reasons Why
Every Poultry Raiser Should Use A. C. W. Goods.
Because They are absolutely free from Chemicals.
Because They are manufactured in Los Angeles. You get fresh goods, not musty from storage.
Because the chaff and indigestible matter is eliminated. No dyspepsia or stomach trouble.
Because A. C. W. Egg Food is prepared scientifically, feeding to laying hens the elements in their best proportions that produce eggs.
Because There is no waste to A. C. W. food.
Because A. C. W. goods are sealed. This insures the consumer obtaining them in their original condition of purity.
If your dealer can not supply you with A. C. W. goods, we will direct from the factory. We manufacture Bone Meal, Blood Meal, Beef Scraps, etc., as well as Egg and Chick Food.

corn. Do you suggest any change in ration? It seems to me that the cost is more than it ought to be, yet I do not know how to balance the ration for less amount.

Answer.—You are feeding rather too fattening a ration for Plymouth Rocks. Leave out entirely the linseed oil meal until next summer at moulting time. If you can give something like cabbage or beet tops or a beet at noon it would give them something to interest them. Add a little more meat to the mash instead of the linseed meal.

* * *

Leghorns and Plymouth Rocks.—(A. B., Healdsburg.) I would like to know through your most valuable paper: (1) Do Plymouth Rocks lay as many and as big eggs as White Leghorns? (2) Are Plymouth Rocks as strong and as healthy as White Leghorns? (3) Do White Plymouth Rocks lay eggs as white as the eggs layed by White Leghorns? My husband stands by the Plymouth Rocks. I stand by the White Leghorns. so I wish the farmers' friend (Cultivator) to settle the question for us.

Answer.—(1) Some Plymouth Rocks lay large eggs and some lay small, and it is the same with the White Leghorns. It depends upon the family they belong to. You can breed a family (a strain) that will lay large eggs by always hatching only from the largest eggs. In this way you can build up a strain (or family) of large-egg layers in any breed. Also by choosing eggs from the hens that lay the most eggs, you can build up a flock of hens that lay many eggs, and in the same way by hatching the eggs from your best winter layers you can get a flock of winter layers.

(2) Yes they are the same if you hatch your chicks from healthy vigorous parents; it all depends upon that.

(3) White Plymouth Rocks lay light brown eggs. I think we might in a few years, by choosing the whitest eggs for hatching, perhaps get a flock of White Plymouth Rocks that will lay white eggs.

The best way of settling the question will be to let whoever takes care of the fowls keep his or her favorite breed. Anyone can do better with the breed he likes best.

* * *

Roup.—(J. F. M.) I have been a reader of The Cultivator for some time, though not a subscriber, and have been especially interested in your poultry department. As I have been having trouble with my chickens for some time I thought I would write you for advice. My fowls are B. P. Rocks and B. Minorcas of excellent breeds. Last fall I left home for a time, so I gave my chickens to a friend to care for with his own.

When I returned I noticed many of them were discharging from the nostrils. The discharge had a very foul odor. Many also emitted a sharp piping cough. As their general health was not affected I thought the trouble was only an ordinary cold and treated them for that. Later on some smelled so badly that I killed them, their ears being filled with a cheesy substance, frothy at the eyes, and slime in the throat. Despite these facts they ate well and held their weight. As the rest seemed to improve and stopped coughing, I thought they would soon be all right, but recently their trouble has developed a new phase; a rattling in the throat, caused from phlegm in the windpipe, and ulcers in the throat, especially around opening of windpipe. For this I dipped a feather in solution of bluestone and swabbed out the throat. This stopped the rattling and also removed the ulcers, but the discharge at the nostrils still continues. I have tried many remedies, but cannot cure my birds entirely. I have consulted a number of poultrymen without learning what ails my chickens. Can you tell me what ails my birds and how to cure them? I have been told it is roup, canker, and nearly everything else. I feed a mixture of grains in the morning, green stuffs at noon and mash at night.

Answer.—It is roup, combined with either diptheria or canker. Roup commences with a cold. Some of your older fowls had that and got well. With some of your younger diptheria developed, and with some (those that do not have a bad odor) it is canker. There is one germ of roup, another of diptheria, and yet another of canker. The cure for diptheritic roup is per-oxide of hydrogen, either swab the ulcers (the false membrane) with it or spray up the nostrils and into the throat with an atomizer. For canker, sulpho-carbonate of zinc is the cure. Paint the ulcers slightly with a solution of four grains of sulpho-carbolate of zinc to one ounce of water—it is very cheap. Put into the drinking water for a week a piece of bluestone as big as a bean for every quart of water and do not give them any other water. If they caught roup at your friend's you may be sure they caught lice also. Clean them of lice, and if at the end of a week they still have a discharge from the nostrils pour a cup of coal oil into two quarts of water in a pail, dip the head of each sick chick into this slowly and hold it there while you count three. I think you will find the per-oxide of hydrogen sprayed up will be the most efficacious as it reaches higher up into the head than any other way. Give the bulb two squeezes for each nostril and three in the cleft of the mouth.

* * *

Crossing Ducks.—(R. K., Santa Barbara.) Please let me know through your paper if it is advisable to cross Indian Runner ducks or common drakes with Pekin ducks.

Answer.—It is best to keep the different breeds pure without crossing.

* * *

Ducks.—(N. E. M., Santa Ana.) I would like a little information concerning duck feed. My boy has four I. R. ducks and one drake, and while they have made a remarkable record, laying 428 eggs in the last four months, yet now they are dropping down to one egg a day. I would not be surprised at their resting after that harvest of eggs, but they are not eating their feed now, and I thought something must be wrong. They have over 50 acres of alfalfa and ploughed ground to run on and they are fed one corn can full each of bran and ground corn mixed with Darling's meat scraps and sand twice a day, and in their yard are kept oyster shells, charcoal, lime and a box of sand, and always have all the water they want to drink in deep dishes. Can you suggest any reason why they should refuse to eat that ration, and is their falling off in eggs due to their not eating or only taking a rest? They are out rustling as soon as they are let out of their pen.

Answer.—Your Indian Runners have certainly done well. It is rather difficult for me to decide why they are resting now, unless they really have earned a rest. Ducks and hens also eat less when they are not laying. The surplus food that is necessary to make the egg is not required when they are not laying. Your ration seems to be well balanced, and I think that the ducks are either moulting or resting, and that by next month they will commence to lay again. If they continue to leave their food, miss a meal occasionally and they will be ready for the next meal.

* * *

Worms, Vent Gleet, Tumor.—(A. S. I would like to ask a few questions. (1) I killed a young White Leghorn cockerel a few days ago. He seemed in perfect health as far as I could judge, but on opening the gizzard I found at the end opposite the open-

I have been breeding thoroughbred poultry for over 20 years and have as fine stock of these varieties as there is on the Pacific Coast.
I also hatch and can supply little chicks from a dozen to a thousand from the above varieties delivered anywhere within 72 hours of San Jose. Prices on application.
J. S. Smith, Box 526, San Jose, Cal.
YARDS—CORNER MOORE AND CHAPMAN STS.

ing that the inner lining was grown fast to the outer flesh and was literally perforated with small white worms about the size of horse hairs. All other intestines seemed perfectly normal and only the end of the gizzard seemed affected. What is the cause and cure?

(2) For several years I have had occasionally a hen that would have a sore around the vent. It is always covered with thick white matter, something as a bad case of roup shows around the head. They eat well, lay good and do not seem to mind it at all, but some day would find them dead under roost. I now have a yearling rooster sick the same way. It is the first male I have ever found affected that way. On dissecting one affected so the other organs usually seem all right. Sometimes the gall is enlarged and sometimes the liver is large and light colored.

(3) Today a hen died. On opening it I found a soft pulpy growth had nearly filled up the cavity around the heart and the lights had entirely disappeared, their space being filled with the growth. It seemed a good deal the texture of the liver, but a lighter color and soft, as if partially decomposed, though no odor was distinguishable. The liver seemed normal as to size, but soft in spots. The gizzard was all right and filled with sufficient grit. She was in good flesh, but not laying, though a mass of small eggs were there.

I have pure White Leghorns, unconfined, and I feed mostly on clean wheat. No roup or cholera amongst them; reasonably free from vermin. Can you give me any clue to the trouble, and should I kill those under fig. 2?

(1) The round worms such as you describe are not uncommon among fowls, and are familiar to dressers of poultry. The round or thread worms are the most common of these.

Treatment.—If you suspect worms, dissolve in the water that is to be used for the mash two grains of santonine for every bird that is to be treated. Give a teaspoonful of caster oil to each bird after the mash, and watch the results. Repeat the santonine every other day for a week. For small chicks give a teaspoonful of turpentine to a quart of water, and allow no other drinking water for a week. Isolate the infected birds, thoroughly clean and disinfect the yards, and burn the droppings.

(2) I am afraid the disease here mentioned is what Dr. Salmon calls "cloacitis," or vent gleet. It is a contagious catarrh of the cloaca. It is not a common disease. The treatment is long and tedious, and unless the fowl is very valuable the hatchet is the best cure.

(3) The tumor which you describe in the hen that died yesterday was, I think, developed by one of the aspergilli, a fungus growth, the spores of which are found in moldy hay or grain. The only thing I cannot understand is, how could a hen be in good flesh and condition having such a tumor. It may have been tumor of the ovary, which seems to be hereditary, and for which there is no cure, as it is rarely discovered until after death.

SATISFIED WITH RESULTS.

In advertising, it is "results" that count. Others might well profit by the experience of Mr. Miller. His advertisement did not cost much, only a half-inch space, but the results were —well he tells the story:

Watsonville, Calif., Jan. 10, 1906.
Cultivator Publishing Co.

Gentlemen: Am well satisfied with my advertisement and the results of same. I have been swamped with orders for eggs, both locally and at a distance; fact is I have not half enough stock to supply the egg demand. Run my advertisement to the last of the month only. I will be with you again next season to stay.

Yours, very truly,
CHAS. G. MILLER.

CHARCOAL FOR CHICKENS.

Charcoal has a cleansing effect on bowels, it can be used all seasons of the year. If pounded into bits the size of a corn kernel, the supply often renewed, fowls will eat a great deal.

OFFICE OF
Must Hatch Incubator Co.
(INCORPORATED)
A. E. Bourke, Pres. Phone Black 1211

PETALUMA, CAL., JAN. 1, 1906.

TO WHOM IT MAY CONCERN;

As the chicken raising season is at hand, we beg leave to call your attention to a few of our specialties.

Do you need an Incubator? Our machines are fully guaranteed and have proven themselves unsurpassed wherever used.

Do you need Brooders? We manufacture just what you want; fully guaranteed, made of the finest material and of the best possible workmanship, and, above all, a practical machine which saves the purchaser money, time and labor.

Do you need Poultry Supplies of any kind? We manufacture a line of Supplies the use of which makes Poultry Raising not only profitable, but a pleasure. Among our specialties are:

Our Water Fountains; our Self Feeder for Chicks, our Feed Troughs, large and small; our Lamp Fillers.

Our convenient Must Hatch Nest Boxes; our safe and sure Must Hatch Insecticide, our sanitery Must Hatch Disinfectant, our sure death Must Hatch Lice Exterminator, our Poultry Compound, a fine Spring and Fall Tonic.

In connection with the above list, all of our own manufacture, we can also furnish the following, which are indispensable to the Poultrymen:

The No. 128 Clover Cutter, the Enterprise Bone Mill, the Ohio Feed Cutter, the Banner Root Cutter, the Enterprise Feed Chopper, the Ideal Duplex Feed Mill, and the Farmer's Boiler.

Do you wish to make your own Incubator or Brooder? We can furnish you all the necessary parts for making an Incubator or Brooder, also plans for the best and most practical Poultry Houses.

Did you ever purchase Just Hatched Chicks? We have a Hatchery of 50,000 chicks per month capacity in operation the year round and have, for the past few years, been successfully shipping, in our specially constructed carriers, just hatched Chicks, to distances as great as 2,000 miles. If you need them, book your order early, as our future delivery list is rapidly filling up.

We can also supply White Leghorn hatching egg in quantities desired. If you have not already received our catalogue, write for Catalogue B, and you will find therein a more detailed description with prices, etc., of the above.

Hoping to hear from you in the near future, we are,

Yours Very Respectfully,
MUST HATCH INCUBATOR CO.

A Million Dollars For the Benefit of the Poultry Raiser

The Hen—consider what she does. Her own value is 50c and she lays an egg daily, valued at, say 2c. In one month's time she lays enough eggs to equal in value her own self.

The annual output of the gold mines of the Earth is small compared to the value of the Egg crop. The American hen produces annually more wealth than all our Wheat fields.

In taking up the Poultry Business, one should remember that "there is more profit in a small flock, WELL FED and cared for than in a large flock poorly fed." The idea that a flock of fowls will shift for themselves and return a profit to their owners, is a mistaken one.

They must be **properly fed** and cared for **every day** in the year if they are to prove profitable.

A. R. COULSON

To increase the profits of the Petaluma poultrymen by at least

$200,000 per Year

They need it. They deserve it—and if they WILL IT within themselves, they can EACH HAVE PART of it.

The rest of the poultrymen on the Pacific Coast may also have a share of the profits. This man's methods, if used by the poultrymen, would benefit the farmers and poultry raisers of California by **one million dollars** per year. It would increase the value of the Poultry Industry of the United States to over $600,000,000 a year.

$4 00 a Hen

How many laying hens have you got now? How many more can you get?

Suppose you could make those hens bring you in an income of $4.00 apiece this year? Could you make use of the money?

Make one strong, everlasting attempt to get out of the rut.

Make some money this year—make enough so you can BUY ALL the things YOU WANT, and still put quite a wad in the bank.

Make the money out of those hens of yours—don't lose hope. Science now comes to yaur assistance and you can make a hen lay

$4.00 Worth of Eggs

Strive to make each hen earn $3.00 a year profit for you.

How? JUST THIS WAY: Success lies within yourself. Are you willing to try?

Make up your mind and stick to it, that you are going to get all there is coming—that you will always see that the hens are kept supplied with clean, fresh drinking water, clean feed and water troughs, green feed, for the hens, warm, comfortable houses in winter, shade in summer, and FEED THEM once EVERY DAY without fail, a good square meal of COULSON'S IMPROVED MASH EGG FOOD, and a variety of other grains as needed. Coulson's Scratching Feed is also recommended to be fed once a day.

Spend a little more for the feed and make your hens lay twice as much.

You know that if you feed your hens this year the same as you did last year that your profits will not be any more, and that you will be just as poor one year from today as you are now, only one year nearer the grave.

To make your hens lay twice as many eggs this coming year, more than they did last year, you must feed better.

The COULSON IMPROVED MASH EGG FOOD will do the work. Use it and get rich.

$4.00 Per Hen

Coulson's Improved Mash Egg Food will only cost you 10c a bag more than the Regular Egg Food or about 10c per year per hen more to feed her, but the results in egg production will be increased by about $1 worth per each hen per year more. $4 Worth of Eggs from each hen per year. Try it.

Their 1st Birthday

Time, December. Since they were three months old they have been fed daily on Coulson's Mash Egg Food. These will be $4.00 Hens this year.

Are You a Knocker?

You know there is a certain class of men who think it necessary to knock every suggestion they hear advanced. It hurts them to suppose that man should be able to make suggestions to them. They are like the Irishman at a Donnybrook Fair, whowent around with a club in his hand, and every time he saw a head, hit it. Every time a suggestion is made to a man of this kind he will get his hammer and knock it on the head.

When Columbus sailed away from Europe people laughed at him, but when Columbus came back with his ships loaded with parrots and savages, proving that there was such a land, then everybody was eager to go to the new country and stake out a claim.

One Man Worth Millions to Iowa

Back in Iowa, a school teacher discovered a method of caring for and cultivating corn so that the yield would be increased nearly 100 per cent. So successful were his methods that Funk Bros., who had 20,000 acres of corn land under cultivation, agreed to hire him for one year to manage their place on good salary, to see what he could do. The result was that year they had an increase in their crop of over 100,000 bushels. The next year, 1904 this man traveled throughout the state of Iowa, teaching the farmers who were willing to learn, how to cultivate corn by a scientific method. That year, as a result, the corn crops of Iowa were thirty million dollars more than had been for any years before, and for ten years previous, the average yield was only 27 1-2 bushels to the acre. Now it is over 40 bushels to the acre. This shows what science can do.

Pick up the new ways—or you'll get left way behind. If in the poultry business, make each hen bring you in an income of $4.00 a year, by feeding **COULSON'S IMPROVED MASH EGG FOOD.**

Keep Up With the World

Fifty years ago you could only travel as fast as a horse could go and over rough roads. Now you can travel from one end of the country to the other between two Sundays. Think of the electric cars, or the sending of messages through the air! And don't forget about the new science of making a hen produce $4.00 worth of eggs in a year.

Don't Try to Get Along Without It

Nowadays it is not the things that we can get along without, but it's how far ahead we can get with the things that will help us to get there.

The Feed Free for One Year

There is no doubt about it. if you feed your laying hens Coulson's Improved Mash Egg Food every day for one entire year, that the hens WILL LAY so many MORE EGGS that the EXTRA EGGS will amount to enough to pay for the feed.

$4.00 a Hen

The average hen, according to statistics, lays only 66 eggs per year—many do not lay that many. A few poultrymen, by imitating as near as they can, a balanced ration, make their hens average 100 eggs per hen, and some as high as 110 eggs per hen per year. A number of poultrymen, last year, by feeding Coulson's Egg Food, averaged 180 eggs per hen per year.

One experienced poultryman, with 2,000 laying hens, fed Coulson's Egg Food the entire year, and the hens made an average of 184 eggs each. Taking the year through, the average price paid for market eggs last year was 28 cents a dozen. According to this, these 2,000 laying hens brought in an income of $8,000.00 OR $4,00 PER HEN.

What It Cost to Feed a Hen One Year

The cost of feeding Coulson's Improved Mash Food every day for one year, and also all the extra grain, Coulson's Scratching Food, etc., included, is $1.25 per hen.

So, if the hen produces $4.00 worth of eggs, they earn $2.75 per hen per year, average profit.

Egg Making Machines

Suppose you could find the substance that would strengthen and develop the egg-making organs of the hen, and at the same time supply the proper feed that could be easily digested and turned into eggs. The result will be that your hens will get to be regular egg-making machines.

That's what you want, isn't it? Then feed your hens one year on Coulson'sImproved Mash Egg Food, and make your little fortune. **SAMPLE FREE.** Ask your dealer about it or send for circular and free samples.

COULSON POULTRY AND STOCK FOOD CO., PETALUMA, CAL.

EVERGREEN NURSERIES.

Did you ever meet Tim Carroll of the Anaheim Evergreen Nurseries? If not, you should. He is an interesting character and has surrounded himseif with one of the most interesting collections of plant growth, and a few moments with him in his nurseries is profitable.

"Yes, sir, I have been in the nursery business since '68. Came here in '67 and was fully established in the nursery business in '68, and since the death of John Rock, I am the pioneer of the State in the nursery business." This long experience has given Mr. Carroll an extended view of the nursery business and has fitted him to cater to the wishes of a discriminating public in a way which is sure to give satisfaction.

Palms are the principal feature of his nursery stock, but by no means the only one. The soil and climatic conditions of this neighborhood are such that the palm has done exceptionally well, so that for years he has made it his one great specialty. He has acres fo Canariensis, or the Canary Island date, whose dark green feathery leaves, wavering over a whole field of them, gives a most beautiful effect. Of these he has all sizes from the baby seedlings up to mammoths in tubs which require derricks to hoist them into a wagon. Of Robustas he also has a vast number. This is, as of course all know, very similar but in some respects superior to the common California fan palm, or Filifera, which has the disagreeable habit of turning yellow or brown during the colder months, and the earlier leaves die much quicker than do those of the Robusta and the Robusta also remains a bright green at all seasons.

Palms and Dracaenas Balled Ready for Shipment.

Besides these, there are Dracaenas galore, Chamerops, Excelsas, Sago, Kentias, Acacias of many kinds, Rubber trees, Pines and a miscellaneous lot of ornamentals of great beauty, and, long names. And Eucalyptus, almost every variety, from Globulus the common Blue Gum to Ficifolia, or the magnificent Scarlet Flowering Gum.

In the utility line, oranges, walnuts, and many other trees are grown to a vast extent; but one fruit upon which Mr. Carroll devotes much time is the Advance Loquat, of which he has a large number of fine budded trees. This loquat is a prolific producer of that delicious fruit which has proven profitable to many California producers.

We give on this page an engraving showing a bunch of palms and dracaenas ready for shipment and gives a slight idea of the extent of the business of these particular nurseries, and also how well fitted they are to take up the work of supplying large ornamentals which may be used by the wealthy planters to give a new place the appearance of one long established in a very short time.

But there are, as well, small plants which those of more modest means may secure and wait for the years of growth to give them size.

All of Mr. Carroll's time has not been given to the nursery business, for at odd moments he has found time to invent a dumping apparatus fitted for unloading from wagons to bins, boats, or cars sugar beets, coal, coke, corn, ore or other materials. This has been established in many sugar factories and on some piers where large quantities of materials have to be unloaded.

With Mr. Carroll is associated his three sons, who are active factors in the success of his business. He issues a beautiful little catalog, which will be sent on request.

The California Rose Co. of Los Angeles have just issued their 1906 catalog, and, like its predecessors, it is distinctively a work of art.

A NEW COMPANY.

The organization of a new company for manufacturing purposes which may be of interest to readers of The Cultivators has been effected during the past week. The company is the International Gas Generator and Power Company, the business of which will be the manufacturing of a gas machine which will make gas for use of gas engines and for house use from the lowest grade of crude oil. The principal factor of this machine is the immense saving in fuel expenses.

The power manufacture will consist of the well known Success engine long advertised in the columns of The Cultivator and used by many of our subscribers. The officers of the new company are: C. W. Harrison, president; M. C. Tunison, vice-president; C. J. Flower, secretary and treasurer. The capital stock is $200,000. It will be a close corporation.

BIG POULTRY YARDS.

While at Hanford recently, e drove out to the ranch of H. R. Lane to see his bunch of white Leghorns. One man had told us he had "quite a few" hens but we were not prepared to see "acres" of them. But they were there and fine large runs, and every hen a healthy looker. Big runs with alfalfa in each is Mr. Lane's hobby. Between the two long rows of runways is an alley down which the wagon goes with feed and to gather eggs.

Brooder house, incubator house, shop and feed room are all most complete and fitted to give greatest economy in handling the poultry business in a large way.

Anyone having need of eggs for hatching will find Mr. Lane's stock of the best. His hobby is to grow hens with a record for doing things.

Rains of the past week have made the pastures in Tulare County green.

American Fence Talks

American fence is a structure of hard, stiff steel wires, possessing great strength and flexibility, adjustable to uneven ground, sound, durable and guaranteed. Great improvements are continually being made over the fences of years ago. See the modern, up-to-date American fence, built of big lateral wires, with heavy upright or stay wires hinged—the most perfect structure for a square mesh fence.

The thirty plants of the American Steel & Wire Co. make every known grade of wire, from the stiffest wire for pianos to a wire almost as soft as silk for weaving into wire cloth. With these enormous facilities for manufacture and observation of the action of wire in all kinds of service, not only is the best wire made for the use required of it, but for less money.

It is Steel that makes possible the great modern structures like bridges, skyscrapers, locomotives and steamships that people confidently trust. Steel for wire is specially made and becomes stronger and more durable by drawing into wire and annealing. And when thoroughly galvanized by lately improved processes and woven into American fence, makes the most substantial structure about a farm. Properly put up and treated, it is a permanent and money-making investment for many years.

We sell through dealers all over the country. In this way, the buyers' interests are best looked after. Dealer then becomes your business friend and he will see that you are treated right. See him, examine different styles, get catalogue and make selection to suit your requirements. Or, write us direct and we will send catalogue and tell you where you can get the fence.

NOT EXPENSIVE—Prices range from about 17 cents a rod up, according to height, style and location of your place.

OUR OWN COUNTRY.

There is a land, of every land the pride,
Beloved by Heaven o'er all the world beside;
Where brighter suns dispense serener light,
And milder moons imparadise the night;
A land of beauty, virtue, valor, truth,
Time-tutored age, and love-exalted youth;
There is a spot of earth supremely blest,
A dearer, sweeter spot than all the rest,
Where man, creation's tyrant, casts aside
His sword and sceptre, pageantry and pride,
While in his softened looks benignly blend
The sire, the son, the husband, brother friend.
Where shall that land, that spot of earth be found?
Art thou a man?—a patriot?—look around;
O, thou shalt find, howe'er thy footsteps roam,
That land thy country, and that spot thy home!

—James Montgomery.

IT WAS A RINGER.

Down in the Washita mountains," remarked truthful James, as he lit a stogie, "there is the most wonderful wonderful echo perhaps that there is anywhere on earth." It's between hills and echoes just the same on one side as the other. Throw your voice one way and it will strike the side of the mountain and then bounce over and hit the mountain on the other side, and then bounce back and strike the first mountain, just keeping the thing up indefinitely. One day I was walking through there and just by way of experiment I let out a holler. It occured to me to quote a little poetry I happened to remember, so I yelled out:

"Lives there a man with soul so dead
Who never to himself hath said:
This is my own, my native land?"

"Well, sir, that poetry hit the side of one mountain and bounced back to the other mountain where it was repeated word for word. Then it bounced back to the first mountain and was repeated again. I stayed there for more than an hour listening to that poetry being tossed back and forth, until I got sort of tired of it, and went away. I forgot all about it for a month, when I happened to go back there, and as soon as I got near the place I heard, as I supposed, some feller talking. I went on and could not see any body, but I could hear something that sounded like a line of poetry. When I came to investigate, blamed if I didn't find that the poetry I had quoted a month before had been bouncing back and forth ever since. It had hit up against the rocks until the first and last lines were worn completely out. All there was left was

"Never to himself hath said."

"That line was still bouncing back and forth from one side of the gorge to the other. I could notice that the voice was getting hoarse, but the echo never stopped.

"Two weeks after that I went back again and found that the words were all worn out but one, the word 'never.' I doubt, gentlemen, if there is another echo like that anywhere in the United States."

"Was that a stag dinner you were at last night?"

"Stag! Man alive, it was stagger."—Philadelphia Ledger.

TOO TRUSTFUL.

Hemery, the winner of the Vanderbilt cup, was being consoled with on the destruction of his superb car.

"I was too trustful," said the young Frenchman, with a rueful smile. "I let the people crowd around me, trusting them implicitly, never thinking that any one would be so careless as to throw lighted matches about. And hence—pouf—my car went up in a mass of flames.

He lighted a cigarette. He sipped his coffee.

"To be too trustful," said Hemery, "is a fault of the French people.

"A stranger once visited a merchant of Marseilles with a letter of introduction from Alexandre Dumas. It was a glowing letter. The merchant welcomed the stranger warmly, and entertained him with great hospitality for three weeks.

"Then in the night the guest disappeared, taking with him his host's best horse, and a quantity of silver plate.

"The merchant on his next visit to Paris sought out Dumas.

"A pretty guest you sent me," he said bitterly. "The fellow decamped with my best horse and plate worth 5000 francs."

"What!" cried Dumas, horror stricken. "Did he steal from you, too?"

A HARD STRUGGLE.

"Men who wear glasses at not attractive to women," said the comedian, Joseph Coyne in a Washington club. "Fat men, too, rarely please womankind."

"The former fact was forcibly brought home to me on a railway journey recently.

"The drawing room of the car I was riding in was occupied by a bride and groom—she was pretty, he was ugly and weak eyed, but a millionaire.

"From where I sat it was possible to hear a good deal that went on in the drawing room. This is one of the things I overheard:

O, George, why do you make faces at me like that?"

"I can't help it, darling. My glasses are falling off, and I don't want to let go of your hands."

FORCE OF HABIT.

Senator Beveridge desired to illustrate strenuously the force of habit.

"In Sullivan, where I spent my boyhood," he said, "there was a physician whom everybody liked; a hard-working, modest, absent-minded man.

This physician was the guest of honor one evening at the house of a leading citizen, and when the gay assemblage entered the diningroom, the leading citizen said to him:

" Now doctor, on account of your surgical skill, I'll ask you to carve. That bird is a 24 pounder, and yet he is as young and tender as a spring pullet. None but you could do justice to him."

"The physician his mind on other things, smiled absently, took the head of the table, raised the knife and made a deep incision in the breast of the turkey.

Then he frowned, rummaged in his pocket and brought out some absorbent cotton, a roll of bandages, and a paper of pins. With these he proceeded to dress and bind up the wound he had made.

The guests were stricken dumb. They looked on in utter amazement. The doctor inserted the last pin, and patted the neat dressing he had made. Then he looked up and smiled.

"And now, " he said "let us hope that in a week with rest and care, our patient will be on his feet again."

THE THINGS WE EAT.

Gregory E. Owens, a food inspector of Manchester, had an odd experience the other day.

He was examining the meat in a small butcher shop on a back street. The greater part of the meat was fairly good, but there was one lot of pork and beef that was questionable.

The butcher stood outside with a customer. The inspector called him in.

"Look here," he said, "what is your opinion of this meat here?"

The butcher looked it over.

"I had forgotten all about that," he said. "It is pretty old stock."

"Well, what is your opinion of it?"

"My opinion," said the butcher slowly, "is that it is unfit for human food, but it might do for sausage."

HIS OWN DOSE.

Irving Grinnell, Treasurer of the Church Temperance Society of New York, told at a temperance meeting a dramatic story.

"A woman entered a barroom," he said, "and advanced quietly to her husband who sat drinking with three other men.

"She placed a covered dish on the table and said:

"Thinkin' ye'd be too busy to come home to supper, Jack, I've fetched it to you here.'

And she departed.

"The man laughed awkwardly. He invited his friends to share the meal with him. Then he removed the cover from the dish.

"The dish was empty. It contained only a slip of paper and that said:

"I hope you will enjoy your supper. It is the same your wife and children have at home."

STICK TO THE FARM.

"Let me tell you about a farmer in Ohio," Prof. Spillman said. "He has eighty acres. Last spring he wrote to me saying although he worker like a horse, he never had any money and he wanted to know if we thought he could make a living by moving to town and becoming a drayman. He kept three cows, he said, and could turn out good butter which was about the only thing he could do with any degree of success. I told him what to plant and where to plant and also how he could increase the number of cows. I didn't hear from him until the other day. He apologized for not writing to me sooner, saying: "I have been so busy carrying out your plans that I have neglected to thank you. Let me tell you now, however, that I have made more money during the last year than ever before in my life. Somebody else will have to be the village drayman."

* * *

A woman living in New York City laughingly tells of her efforts to help a poor woman with a large family of children. They seldom had enough to eat, little to wear and were frequently without shelter, and on account of their extreme poverty the privileges of school were not available. A place was found for them about fifty miles in the country on the farm of a friend who gave them the use of a neat little cottage free, and who also was willing to pay for all the work the mother and the children could do about the house and farm. The children were to have the privileges of the nearby school. Everything worked well, apparently, for a time, until one fine morning no "friendly smoke" appeared from the chimney of the little cottage, and no one came to the farm house to assist in the work. Inspection of the little home showed that the mother and children had literally flown from the scene. A week later, my friend met the woman on one of the busy streets of the city. To the questions propounded came this reply—"Oh, sure! and it was too lonesome out there to stay! There was nothing going on! No parades, nobody going by on the streets, no neighbors droppin' in to talk over miseries with, no fights and murders, no fires to run to," etc.

Well, right there was the key to the situation! Unable to read and write, with no knowledge of anything, except what was gathered from the city pavements, "misery and trouble" around them at all hours of the day and night, they missed the horrible excitement of discussing the misfortunes and crimes of their fellow beings. Although so many infinitesimal atoms, whose loss from the complement of the city vitality would be no more noticed than the annihilation of so many motes in a sunbeam, yet they felt the attraction of friendly intercourse with kindred atoms and so gravitated back to their natural element. Taken without due preparation to the country, it proved an utter blank to them. Baring the creature comforts of life, it was like placing them on a desert island in mid-ocean.

It is not necessary to consider the conditions of city life except to profit by the lessons that may be learned therefrom.

Returning to the consideration of the drag back to the content and happiness of the farmer and his wife in that they cannot hold their sons daughters to farm life, it will be advisable to reflect upon the condition of their surroundings and then search out the reason of their aversion to it. It is easily found and defined as a lack of interest in, due to the ignorance of, the details of daily life. The city cousins come to visit them, and they are full of animation and narrate many stories of the wonderful things they have seen at school, at the museum, in the parks, etc., and the poor little country bumkins are speechless in blank wonderment and envy. They have nothing to relate. Everything is so simple and commonplace around them; nothing but grass trees, bushes, meadows, orchards, nut trees, fields of wheat, rye, oats, barley, alfalfa to towering stalks of corn, hills, immense rocks, a river, perhaps, a windmill, horses, cows, pigs, sheep, hens, chickens, dogs, kittens, lots of pets, bees, insects, birds in every variety, animals of the forest and prairie, beautiful wild flowers all around. No! Nothing to speak of! Poor little mor-

tals! A thousand things around them, but all so eommon that they are not worthy of mention or even notice, and for the simple reason that they know nothing of them.

Right here is where Nature Study comes to the rescue. These restless active minds must be supplied with the wherewithal to satisfy the craving that leads them to seek other scenes for its gratification. Coutry children above all others are the ones to whom the mysteries of nature should be unfolded.

HER BEST ACCOMPLISHMENT.

A young married lady, who by the way, is an accomplished artist in oil, was telling the Cultivator recently that she enjoyed housekeeping for the variety of incidents it embraces. She said: "My father spent thousands on me to make me an educated girl. I can paint pictures which will sell in Philadelphia or Chicago or New York, but I can make bread and bake pies which my husband insists are better than he ever ate in Delmonico's swell restaurant. I consider my cooking ability my best friend.

SHALL THE FARMER SEND HIS SON TO COLLEGE.

"The other day I advised a well-to do farmer to send his son to an Agricultural College," said Mr. Kelsey of Missouri recently. "If I wanted to be sure he would never amount to anything as a farmer, I should do so," was his reply. There are a great many people who believe just as this man does that education leads away from agricultural pursuits. I remember quite well when I was a Missouri farmer boy, my father used to dampen my ardor for an agricultural college education by telling me of a schoolmate of his who went off to college, married a college girl and then came back to live with his parents on the farm. "And he never did any good," the old gentleman would conclude, "and finally got away with most of his father's property."

The trouble about the old gentleman's reasoning, as the Cultivator has often pointed out, is that he doesn't understand that the men who do the teaching are not, as he supposed, ignorant of the practical problems of farm life. The teachers of horticulture in many colleges, have their own fruit farms. The teachers of animal husbandry are actually engaged in feeding operations upon their own farms, or upon the college farm; the teachers of dairv husbandry have been managers of private creameries. And so it goes. It is the practical knowledge these teachers possess which give them value as college farm educators. Some of the ablest men we have in motion today graduated from the agricultural college.

HIS VALUABLE ASSET.

The experience a young man gains on the farm is a most valuable asset. He should not throw it away by entering some other profession in which this experience is of no special value. This is particularly true when we consider the extent to which most of the professions are crowded and the unusual opportunities now afforded in agriculture.

The college boy—"Dad, I think I'll tackle the Wall street game as soon as I get my sheepskin."

The old man (dryly)—"Well, I believe that's the proper apparel for young men in that district.—Puck.

Cookery Recipes

MASHED SWEET POTATOES.

Boil with the skins on and peel into a hot sauce pan. Add a half cup of hot cream to a half dozen potatoes.

* * *

LOIN OF VEAL, FRANCIS STYLE

Stuff about seven pounds of the loin of veal cut from the best end with veal force meat, truss it and cover it over with sheet of thickly buttered paper. Roast for an hour and a half, basting frequently with butter. At the end of the time baste it with milk or cream until it is well cooked, which will take about thirty minutes longer. When done make the gravy in the pan with the basting cream.

* * *

FRIED ONIONS.

Cut large white onions in thin slices so as to form large rings. Drag them around in a pan of flour until they are thoroughly covered. Plunge them into a kettle of hot lard and fry until they are golden brown and quite crispy. Drain on a cloth, season with salt, and serve on a folded napkin.

* * *

ONIONS SUPREME.

Peel and cut into thick slices a half inch thick. Throw into kettle of boiling salted water and cook for thirty minutes until transparent. Drain, saving the water. Take a half pint of it and add a thickening of a tablespoon of butter and one of flour, salt and pepper. Take from the fire and add two beaten egg yolks and four tablespoonfuls of cream. Stew over a pan of hot water for a minute and be careful not to curdle.

* * *

BAKED ONIONS.

Peel and boil for about forty-five minutes. Dry with a cloth, squeezing the water out of them, put in a baking dish, put a small piece of butter on each and bake for an hour with a covering of buttered paper.

* * *

ONION LEFTOVERS.

Chop cold boiled onions fine, and add a little white sauce and put in a baking dish with bread crumbs over the top. Brown in the oven.

TREATMENT OF RATTLESANKE BITES.

Immediately after receiving the bite if on leg or arm, a ligature of some kind should be bound as tightly as possible between the wound and the rest of the body. A rattlesnake's bite consists of two punctures a short distance apart. A gash should be cut with a sharp knife in a line with the punctures and to their full depth, thus connecting them, and the wound should be allowed to bleed freely. If another person be present, it is well to have the wound sucked so as to draw all the venom from it. Taking the venom into the mouth momentarily and quickly ejecting it does no harm provided the person has no wounds or scratches through which the poison could find a way into the blood.

While this is being done the sufferer should be given stimulants of any kind that is convenient. Spirits of ammonia diluted in water and administered every fifteen or twenty minutes will produce good effects, and so will whiskey or other alcoholic beverage, the design being to stimulate the action of the heart. After the wound has been thoroughly drained and little or no blood comes from it, free application of spirits of ammonia, turpentine or carbolic acid should be made, for the purpose of cauterizing it.

WORTH THE COST.

The best friends of the rural mail service are the women. They derive both benefit and pleasure from it and when it is permitted to carry parcels under a parcels post law it will be an invaluable help to farmers' wives who will use it for half or the necessities the home demands.

The Farm and Floral World is right on this subject when it says:

"The rural mail service is well worth all that it costs and its extension should be hastened as circumstances will permit. The initial cost of establishing new routes will continue to be a drain on the postal revenues, perhaps, but the necessity of national development, the rural free extension cannot be questioned. As a means of national education and of delivery has proved its value, and as the system grows it will become more nearly self-supporting; and should the parcels post be established, it will be fully so. Indirectly, the service benefits trade by bringing the country into easy communication with the towns and cities, and it does a great service by increasing enlightenment, comfort and contentment in rural districts.

Mr. Newwed—I shall never, never love another woman as I love you.

Mrs. Newwed—I should hope not.

Mr. Newwed—You needn't to get so sore about it. I guess I could if I wanted to.

"Dependable Furniture at a Fair Price."

New Styles and Colorings in

Reed and Rattan Furniture

Some time ago the rattan furniture was very popular, and it is again becoming greatly in favor. The latest productions are very artistic, and on account of the different treatments and colorings they are very desirable. We have just received a large shipment of chairs, rockers, settees, steamer chairs, etc.

Some are in the natural light color, while others are in various shades of green and brown. The dark browns are very desirable for use with the Old Mission weathered oak pieces.

This furniture is all of the highest grade and is priced low. We ask you to call and see the showing.

Climate and Crops

U. S. Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, Jan. 23.

General Summary. Warm weather continued nearly all the week throughout the State, but with lower temperature and heavy frosts in the central and northern sections on the 20th and 21st. Heavy rain fell in all sections and there was a heavy fall of snow in the mountains. At many points rivers and creeks overflowed their banks and there were some breaks in the levees in the Sacramento Valley, causing considerable damage to grain fields, bridges and other property. All streams commenced falling slowly on the 19th.

All farm work was temporarily suspended during the storm, but plowing and seeding will be resumed as early as possible and the grain acreage materially increased as a result of the generous rains. The soil is so thoroughly saturated as to practically insure good crops. The warm weather was beneficial to grain and grass. Early grain is in fair condition in the central and northern sections and excellent in Southern California. Feed is scarce, except in the south, and cattle and sheep have suffered severely from the continued storms and lack of feed. The seasonal rainfall in Southern California is greater than last season's at this date, but elsewhere it is considerably less.

The cultivation of orchard and vineyards is progressing as rapidly as possible under the unfavorable conditions. Trees and vines are in excellent condition and the outlook for good fruit crops is considered promising. Orange picking and shipping are progressing in Southern California.

Eureka Summary.—Farming operations suspended. Grass and grain are making slow growth. Stock are in poor condition. Heavy rains overflowed streams and much bottom land was submerged, but water is rapidly receding. Considerable damage was done to property.

Los Angeles Summary.—Generous rains in all sections thoroughly soaked the earth and the soil is in fine conditions for cultivating. Grain and grass, which were at a standstill, received new life. Should warm weather follow, vegetables will make vigorous growth.

For Exchange

Walnut and Loquat trees, Gardena Dewberry and Brandywine Strawberry plants for Logans, Mammoth Blacks or Phenomenals.

Lock Box 14, Whittier, Cal.

A Sharp Razor

Makes Shaving Easy

It is a pleasure to shave when your razor is sharp. With "Every Man's Dry Hone" you can give your razor a keen cutting edge with a few strokes. It is a perfect hone, made for home use, and guaranteed to give satisfaction or money refunded. No water or oil necessary—self-lubricating. Always ready.

Mailed on receipt of $1.00. Send in your order now, while you are thinking about it. Be ready for your next shave.

WELL WORTH KNOWING

Any Lump in Woman's Breast is Always Cancer.

[San Francisco Examiner]

The papers noted recently several marvelous cures of large breast cancers by Dr. Chamley, the world-renowned cancer specialist, of 25 Third St., San Francisco, Cal. This Doctor makes the bold assertion that he has in 33 years cured more cancers than any other physician living and offers $1000 if he fails. No X Ray or other swindle. A Pacific Island plant extract makes the cure in the privacy of the patient's own home. That not a dollar need be paid until cured is proof of the Doctor's honesty and fair dealing. He has the best book ever published on cancers cured without knife or pain, and proves that any lump in woman's breast is cancer, also that any tumor, lump or sore on the lip, face or anywhere six months is cancer. This book telling of thousands of wonderful cures everywhere is sent free to all who write Dr. & Mrs. Dr. Chamley & Co., describing their cases.

ACRICULTURAL EDUCATION

(Continued from First Page)

people. This is the stage of educational development in the midst of which we are today.

Naturally the movement for the remodeling of our school system to meet the requirements of industrial life had its most active development first in the cities, where the school system was most highly organized and where the very rapid increase in the extent and variety of mechanic arts and manufactures created a tremendous demand for youthful workers whose minds had been prepared to deal with the problems presented to such pursuits. Already provisions for the teaching of mechanic arts in the public high schools is made in 40 States. While in 1890 there were only 37 cities of 8,000 population and over in which manual training was taught in the public schools, in 1902 there were 270 such cities. San Francisco and Los Angeles are among this number.

The most important result of this movoment is that our leading educators now have changed ideals of education and recognize that the industrial element is an essential factor in a completely cultural education. The movement for agricultural education therefore has a sound pedagogical basis.

It is not the old trade-school which we wish to revive and make a part of our public school system. The object is not to cut out the old studies which educators agree should be included in all elementary and secondary courses, but rather by a more judicious selection of the topics to be taught in the various branches, make room for the enrichment of the public school courses by the introduction of instruction in agriculture, mechanic arts and domestic science. The elimination of useless topics and the judicious employment of the elective system in the high school, will allow agriculture to be taught in an effective way and make the atmosphere of the school room favorable to the cultivation of a love for country life.

The teacher can also now say for the encouragement of the farmer that owing largely to the work of the United States Department of Agriculture and the agricultural colleges and experiment stations in California and the other States, there is now a large body of definite knowledge which may be called the principles of agriculture. And this knowledge has been already more or less completely reduced to pedagogic form for use in various grades of schools. Elementary textbooks and books of reference on agricultural subjects are now in existence and being rapidly multiplied. Successful examples of the teaching of agriculture in the schools are already found in this and other countries.

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

DOG DISTEMPER.

Editor Cultivator: I have a valuable young dog which has distemper, I think. Give treatment..—J. C., Lemon Grove.

There is a distemper vaccine, sold by all druggists, which cures as well as prevents. Ask your druggist for it.

WORMS IN PIGS.

Editor Cultivator: I have a litter of nice pigs, but in the last few days they have passed worms and begin to look stunted and weak. What can I do to clean their stomachs and intestines of worms?

Dissolve in hot water about a teaspoonful of copperas (Sulphate of iron) for each hog. Mix feed with this, so that hogs will get all the copperas. Repeat in a week. Hold up on the grain food a little for three days, until the copperas has time to work.

WARTS ON TEATS.

Editor Cultivator: I have a No. 1 Jersey cow with warts on teats which I would like to have removed. Could you give me a remedy?—J. T. McC., Healdsburg, Cal.

Smear the teats well after milking with olive oil. If this will not remove the warts touch them with a stick of lunar caustic, after cutting off with a sharp pair of scissors. Then apply pure olive oil to the sore.

RINGWORM.

Editor Cultivator: My cattle are troubled with a white, scabby growth around their eyes, which seems to extend in the form of a ring. The cattle scratch the sores and seem to be restless, although they eat well. What can I do to cure the trouble?—H. J. W., Modesto.

I think your cattle have ringworm. Wash the parts thoroughly with one of the coal-tar products in a five per cent solution; do this daily. Sulphur and lard in the form of an ointment is oftentimes beneficial.

ABORTION.

Editor Cultivator: My neighbor has a valuable mare that has just lost her second colt about six weeks before due. We can attribute no reason whatever, as the mare is in good fix and has not been worked for two months. Can you suggest any remedy or must she be abandoned as a brood mare? Would she be any more likely to carry a mule colt the full time? Please answer through The Cultivator.—D. C. H., Carpenteria.

A mare having once aborted is likely to do so again. If you skip one year and then breed her she will carry through in all probability all right. I don't think the breeding for mule would make any difference.

The New Pomona Pump

We must not attribute all of the
success of the Pomona Pumps to
the Pump Head or the part of the
machinery above the ground, for
there is another part just as essen
tial, and this is the cylinder and
valves. Our cylinders are made of
the best seamless brass tubing
made to our order in the East. The
valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pump-head using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

Citrus Deciduous Ornamental TREES Vines Palms Roses

And Every One True to Name

When you buy goods of any kind you of course find it to your interest to do business with an old established firm that has made a reputation for itself by selling dependable goods. Did you ever stop to think that a nursery that has been engaged in working along certain lines for a period of twenty-one years, and has developed a business extending throughout California, as well as into many other states and foreign countries, is a safe institution for you to do business with? Growing trees is no difficult matter, but to have them true to name requires great care and a thorough knowledge of the business brought about by years of hard work and close application to business, backed by a pride to give our customers, old and new, square treatment, and never to make any misrepresentations.

Deciduous Fruit Trees

Are grown in new land in the great Kings River bottom where the soil is so deep and loose that our trees have not only made a magnificent top growth, but have a fine fiberous system of roots, which is in itself a great recommendation to any fruit grower.

Citrus Trees

If you want an assortment of varieties we can supply you with the leading kinds of Oranges, Lemons, Pomelos, Limes, Citrons, all grown in the great thermal belt near Exeter, Tulare County. Trees are well matured and stocky, with rich, dark green foliage, which is typical of the perfect citrus trees.

Grape Vines

On their own roots and grafted on Phylloxera Resistant roots. The largest stock and the most complete assortment on the Pacific Coast. Let us figure with you on your requirements. It will be worth your while.

Apples

All standard sorts, budded and grafted on whole roots. No piece roots used.

Pears

No blight in our stock. If you want the best come to us.

Cherries

We have a complete line of all the standard varieties, but the bulk of our trees consists of Royal Ann, Bing, and Black Tartarian. Any cherry grower knows how they stand in the markets, and further recommendation from us is not necessary. We have a limited number of trees on Mahaleb root.

Plums and Prunes

are again coming to the front. Prunes have paid well this year and their ready sale shows what can be done with a fruit so universally in demand, when the price is right and the quality above criticism.

Apricots Peaches Nectarines

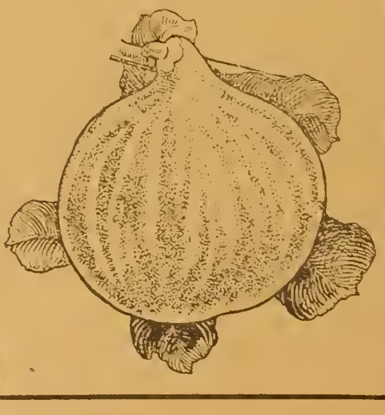
We have a good supply of the standard sorts, but stocks are becoming depleted fast. If you contemplate planting this season put your order in now. Don't delay! This is good advice to follow.

CALIMYRNA R FRESNO

Figs

One of Our Great Specialties

In the lead stands the CALIMYRNA, the fig above all others for commercial purposes. Ours is the only orchard in the United States producing these figs on commercial scale. When you buy trees from us you get pedigreed stock. Our seal must be on your trees if you want the genuine article.



Almonds

The Hatch varieties sold for from 13c to 15c per pound this year. Better put in your order at once. The best trees always go out first.

Chestnuts Pecans Pistachio Nuts

We carry these both in grafted trees and on their own roots, in the very best varieties, of course.

Walnuts

Placentia Perfection is the great money winner, selling for 18c per pound this season. We have trees on their own roots, as well as a magnificent stock grafted on California Black Walnut roots. Prices for grafted trees lower than ever before. A fine stock of all other varieties in grafted and also grown from selected seeds.

Olives

California Olive Oil and particularly Ripe Olives are forging to the front after years of earnest and persistant effort to introduce them. We have all the standard pickling and oil sorts. The demand is good and leading varieties are going fast.

We are Universal Providers for Orchard and Garden

We do not confine ourselves to Fruit Trees alone, but grow also an immense assortment of Ornamental Trees and Shrubs, Climbing and Trailing Plants, Palms for House Decoration and Outside Planting, Roses in Tree and Bush Form.

Free Catalogue

We will mail our large, profusely illustrated catalogue, English or Spanish, to any address on receipt of 5c postage. Price list mailed on application.

California's Proposed New Insectary

By E. K. Carnes

The possibilities of California's proposed insectary which is to be situated on the Capitol grounds at Sacramento, are unbounded, because the climatic conditions of that particular section are peculiarly adapted to the needs of insect propagation, for there cycles of parasites can be reared in practically continuous rotation, and this means a ration of production far beyond what can possibly be obtained in sections less favored in the matter of climate where all surrounding conditions can be made as near like Nature as it will be possible for man to imitate and where our little friends who are more powerful, more persistent, more patient than we, can be propagated in large numbers and infested orchards thoroughly stocked at once with the proper parasite and the same benefits realized in a short time, that under our past and present arrangement was not possible for a considerable time.

In the face of the signal advance made along the lines of Parasitology it is no exaggeration to say that its future is all before it. The progress made so far is only a brief demonstration of the possibilities awaiting the hand of enterprise. When we consider the past success of insect control by means of their natural enemies, we cannot help but wonder that the means to create such enormous savings, to which the world today bears witness, have been allowed to to remain in unmolested security for so long a time in their native homes. As it is, the value of our "insect friends" in combatting "insect foes" is but little understood, in fact, very few of those receiving direct benefit even know of the existence of their benefactors.

We can only, in a vague manner, comprehend the mechanism of Nature or realize the power of that influence which we term Parasitism, which holds each species of insect in its proper sphere and prevents them from becoming destructive hordes of depredators, but were we to lose any of our important parasites if imported pests or even some of the partial checks of our native pests, we would very soon feel their loss and perhaps appreciate their present value.

It is a well known fact to all of our county Horticultural Commissioners, and also many of our leading growers that for many years past the only space allotted to the work of propagating insects to supply the entire State, consisting of approximately 500,000 acres, was a little 10x12 room, and in this little room there has been produced the start of our most efficient parasites in the State today, which have, in several instances, accomplished in a few years, that which has for many years past puzzled the brains of the entomological intellect from all over the world, and which pests have resisted the steady, studious and unremitting application of every known artificial means of eradication.

Who can estimate the value in dollars and cents, which has resulted directly from the introduction of beneficial insects, to the fruit industry of California, and, mark you, the source of this great benefit has been a little 10x12 room, and for several years prior to 1902 was even less, and the work of propagating these insect friends was done at odd moments in connection with the regular quarantine work of the State Commission of Horticulture.

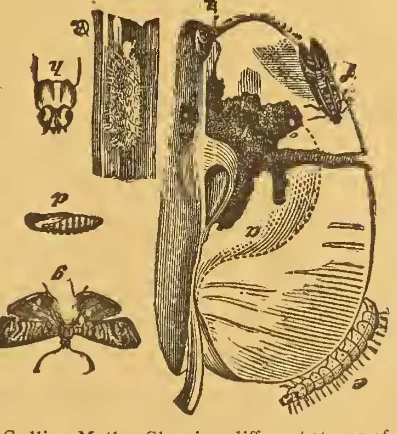
If the present status of the parasite problem has been accomplished under these conditions in the past, and enormous savings afforded the grower, who can estimate the possibilities of a separate department, with this special work as its sole object.

When an individual or community porposes to erect a building, it is presumably for a profit, or that the proposed structure will be a benefit. As we are living in a financial age, we will the treat the Insectary as an investment. In such a case, the first object is to have a desirable tenant, and therefore I will enumerate the tenants we have in view, who are now in houses of cramped quarters, simply awaiting the room to expand into untold usefulness which our present quarters or equipment will not permit.

As Sonoma county is more vitally interested in the parasite for the Codling Moth (Calliophialtes messer Gravs.) I shall therefore mention it first. The discovery and introduction of this parasite was received with joy by thousands of apple growers in every section of the State, who for years have been compelled to submit to the ravages of this terrible pest, notwithstanding the terrific warfare which has been waged against its attack, the pest has not been subdued and it has been necessary to continue the application of many vile and poisonous decoctions in order to reap a portion of the crop, for the trouble and expense of producing it, but which has been demonstrated by our scienttists to be a good investment. Yet to overcome this necessary expenditure of time and money and try to reproduce the existing conditions of certain other countries where the Codling Moth exists but is not a pest, and where it is not necessary to spray or take any artificial measure against it, to have the work performed at a cost of nothing by Nature's forces, has been the object of the introduction of this parasite.

The apple industry of California covers such an extended area that under present existing conditions, we have been able to supply only a comparitively-small percentage of the applications received. However, we have managed to place colonies in almost every apple growing section of the State, and from the reports on such colonies, we are satisfied that the parasite has come to stay and will, with the proper support, in the way of propagation and distribution do to the Codling Moth what the Vedalia cardinalis and the Scutellista cyanea have done to the Cottony Cushion and the Black scale. The growers have been somewhat impatient because we have not been able to supply any where near the applications received but when our facilities for this work have been taken into consideration, it must be acknowledged that we have done exceptionally well.

The work of rearing parasites is attended with much labor and close watching and requires a great deal of time in order to attain the best results, but at the proposed insectary we will be able to turn out parasites in large numbers, and if we can establish this one parasite in the apple orchards of our State, and, through it, hold the Codling Moth under subjection, the amount that this one parasite would save will amount to many thousands of dollars, over and above the cost of maintaining the insectary for many years.



Codling Moth.—Showing different stages of development.

There exists in Southern California in alarming numbers, two very seriuos pests of the citrus trees, viz: the Red and Purple scales, which have caused enormous loss, and their presence has made it necessary to expend lrage sums of money to resist their onslaughts and prevent their spreading to uninfested areas. For years we have heard the cry for a parasite for these two destructive pests and we now have, at the San Francisco office, a shipment of material from which we hope to rear the internal parasites for both these pests having been recently discovered and introduced by Mr. George Compere, our entomological explorer (who also found the Codling Moth parasite for us) after a perilous trip in the interior of China, where they have held these pests in subjection for years at a cost of nothing. The possibilities to the citrus industry, through these two valuable accessories to our fighting force of Nature's agents, must, therefore, be very great, and if we can subdue these two pests of the citrus and relieve the growers of the necessity of yearly spending thousands and thousands of dollars that certainly will be equivalent to a fat dividend on our investment.

These are the newest importations of beneficial insects and combined with the many that we already have and those we propose to introduce for other scale insects, the Thrip, the Vine Hopper, the Peach Borer and the Hop Louse, with the additional advantages of the insectary, where the conditions of the various forms of parasitic life may be greatly assisted and given every opportunity to increase in large numbers, will give us a force with the assistance of which we hope to eventually solve the problem of insect control, without the usual expense attending such an operation.

The work is merely in its infancy and there is much to learn before it is brought to its highest possibilities, but the growers are thoroughly awake to the individual benefit that may be derived through the application of Nature's forces in this respect and there can be no question regarding the wisdom of the action of the growers when they appealed to those in power for an appropriation that has made possible the establishment of the proposed department for our parasites, the establishment of which will enable them to outshine even their brilliant past, which will stand as a monument to our early investigators who give us the science of fighting "Bugs with Bugs," and whose intellects opened the way to secrets previously hidden from mankind and solved a problem, that man, with all his devices of destruction, was unable to cope with.

We also have many native parasites in the State that with proper aid in becoming distributed into various districts where they are needed, should add greatly to their efficiency. These can be cared for at the Insectary and properly distributed. In connection with the main Insectary we hope to enlist the support of every County Commissioner in the State and to work in conjunction with them, to establish a branch insectary in each county, under the supervision of the resident commissioner, who could draw his supplies from the main insectary and receive all consignments for distribution in his section and see that they were properly estab-

(Continued on Page 115)

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

CULTIVATING AND PRUNING.

Editor Cultivator; Will winter cultivation make such trees as apricot and peach bloom earlier? I have heard it objected that it does.

What do you consider the object in pruning?

In a nursery catalogue I received a rule for pruning peaches like this: When the trees are set out, top down about 18 inches and afterward to top the new growth about half. If we prune for a good shape, which I do, is there any benefit in all this cutting back?—G. L. H.

We do not know of an instance where the question of early blooming following winter cultivation has been thoroughly tested. It would require identical conditions with both treatments side by side to decide this point.

The objects of pruning are to force the trees to produce the maximum amount of the highest grade of fruit, protection to the trees which would consist in strengthening them by producing heavy stocky branches so as to support a heavy load and not break and to protect them from the sun which will cause scalding of the bark and the consequent rapid decline of the tree. Heavy cutting back while the tree is young will do all this. It will also prevent the tree from fruiting before it is able to mature a crop, without the grower pulling all the fruit off by hand, which he would surely have to do if he did little or no pruning. A good shape in a tree might mean several different things. One shape might be good for one thing and another shape be required for another purpose. The economy in picking friut from a low pruned tree greatly offsets the disadvantages encountered in cultivating around such trees. The advantages presented in a low pruned tree at pruning time are of considerable importance. The usual California fruit grower considers a low, dense and stocky tree, of good shape. It has to be to yield the best results. Were he an eastern grower, it might not be of good shape.

It will do to mention in connection with winter cultivation, that this is not considered good practice among California growers. Winter cultivation cuts off the current supply of humus and your soil soon becomes soggy and dead. It soon becomes difficult to work with ease and the trees do not bear as good crops. The soil will not hold its moisture so well and where irrigation is required, more water and more frequent applications will be necessary. Fertilizers will lose their effects to a greater degree. The weeds that grow in the absence of winter cultivation add humus, the life giving element, to the soil and prevent washing of the soil during storms. There are too many advantages in non-winter cultivation to seriously discuss the matter. Let the weeds grow and you have settled the question of "early blooming." It saves expense and adds profits. A point in hand came to our notice a few hours ago. A teamster came to us asking for work, saying that he always made good money with his teams during the winter, cultivating orange groves, but this year everybody planted peas in their orchards and there is no team work during the winter months.

VARIETY ORCHARD.

Editor Cultivator: I wish to set out five acres near Monrovia, to different kinds of fruit trees, early and late. Would like to have some peaches, plums, pears, persimmons, and grapes. Please advise me the best kinds to plant.—A. C. H.

For a variety of early and late peaches, plums, pears, persimmons, and table grapes, we would recommend as follows: For peaches, Dewey, Amsden's June, Yellow St. John, Large Early York, Belle of Georgia, Lewkin's Honey, Elberta, Gresham, Lovell, and Salway. These are named in the order in which they ripen except Lovell which ripens before Gresham. This will make an ideal fancy peach orchard, will keep you in peaches of good quality from June till October. For black plums, Rivers Early Prolific is the best of its class to ripen at that time, July 15th. Cherry Plum is the earliest plum of much value. Ontario is the best bearer of the Green Gage type. Tragedy is the best all round eating plum of the European type. It is slow in coming into bearing but lasts over a period of thirty to forty days and is attractive in appearance. The best Japanese plums are Wickson, Kelsey's and Sultan. The climax of our native plum as tested at the Pomona station is a late red sort that ripens in November. We received it under the name of Wayland. It never fails to set a crop with us.

Seckle, Lawson, Coles and St. Andre make a good list as tested at the Pomona station. Bartlett is fine but soon dies of the blight unless carefully handled.

Any of the Japanese persimmons listed in the nursery catalogues are good. Those described as having brown flesh are comparatively free from the astringent properties so common in the persimmon.

The best varieties of table grapes are Blue Portuguese, Chasselas Rose, Muscatello fino, Cinsaut, Olivette de Candanet, Muscat, Verdal, Napoleon, Damascus and Cipro Nero. Tokays are favorites with some and when fully ripe are rich though coarse. Golden Queen is a very prolific late grape and of good quality about November first. Cipro Nero is the best late blue grape. It is very tender and cracks badly if rained on. Purple Cornichon is a late grape that will not crack in the rain and will ship around the world.

* * *

COWPEAS.

Editor Cultivator: Will you kindly advise me through the columns of the Cultivator in regard to the planting of cow peas? How many pounds per acre should be broadcast? Is it early to plant them the latter part of January in Sonoma county near Santa Rosa? Have already planted garden peas but do not know if cow peas are as hardy as garden peas.—F. H. L., Santa Rosa.

Cow peas are not peas but beans, and will not stand any more frost than wax beans or any other garden bean. It is not safe to plant them earlier than May and then they are liable to get weather that is too cold for the best results. You will get better and more vines and peas too, if you defer planting till the ground warms up for good in the spring. Cow peas sown in July and August

Practical Farm Science

BY PROF. A. J. COOK

BEET CULTURE IN GERMANY.

In two respects Germany may claim proud pre-eminence; in Analine dye production, and in the wondrous development of her beet-sugar industry. Of course our readers are not specially interested in the first, and yet so marvelous are the number, variety, and use of these coal tar products, and so wondrous is the work that German scientists have wrought in this line, that a few words are warranted. In the old days, colors, especially the "Royal purple" were very costly so that only the very rich could afford the finest colored fabrics. Today the finest colors of every conceivable hue can be had at so low a cost that one need only consult taste, not the pocketbook, in selecting his favorite colors. Even the most delicate staining materials, used by the microscopist in his intricate study of bacteria is obtained from the same coal tar and has been obtained through hard, close, marvelous researches of these same interesting Germans. The value of these discoveries, to the world is beyond computation. So astute is the German chemist, that it may be justly said he may rightly lay claim to the monopoly in this matter of Analine dye productions. In working out the brilliant and almost infinite number of colors, which are exceedingly cheap, the chemist has also discovered many other products that are hardly less important and valuable than are the dyes.

* * *

The other line of development—beet-sugar—does intimately concern us in America for we are soon to become one of the very first countries in the quantity and quality of our beet-sugar products.. California is, of course, chiefly interested in all that pertains to beet-sugar production, and so it is especially agreeable to me to pry into German ways and methods. As beet-sugar production is one of the most important industries of this great country, we are not surprised to find that the government, which is keenly alive to whatever concerns the practical interests of its people has spared no pains in fostering the most thorough and efficient research in every scientific branch that bears on the production of beet sugar.

Way up in the northern limits of Berlin, is the beet-sugar institute. It is a part of the great university, and is so widely separated only because of lack of room close about Unter den Linden. This is one of the newest colleges and research buildings in the world, and as we might expect is wonderfully fine in its style and equipment. It is in charge of Prof. Herzfeld, who takes a rank among the first beet-sugar experts of the world. In this institution, which is devoted solely to research in beet-sugar lines, and to the giving of the instruction in the same line of study and inquiry, are to be found the most able investigators and students from all parts of the world. Here every process in sugar production is scanned with the closest scrutiny of the scientists; that old methods of separation of the juice from the pulp, and of refining the product, may be improved to the very utmost. Thus it is easy to see why Germany keeps in the van in all matters relating to the production of this article. I have had several interviews with Prof. Herzfeld and his able corps of assistants, and have had the pleasure of carefully inspecting the superb plant, which is surely an honor to him and his country.

As is well known, we now purchase nearly all our beet-sugar seed from Germany. As the Germans have very carefully bred this seed, it is doubtless wise for us to use only such seed, that we may get beets of the highest sugar content. Prof. Herzfeld feels that we must always do this as he thinks we have not the requisite climatic conditions in America to enable to produce the best seed. He thinks California is too warm and that most other states are too cold and probably some have too dry an atmosphere. I wonder if this is simply opinion, born possibly of hope and patriotism, or whether it is founded on careful scientific investigations. Surely we have in America every possible condition of climate, both as to moisture and temperature, and some where we should expect to find the ideal location for beet-sugar production. If, as I believe, we produce a superior beet, as shown by its high percentage of sugar, then we may, surely hope to produce seed of like merit. As we have experiment stations in all the states, manned with able investigators, we may soon expect an opinion from them on this subject, and I shall not be surprised if it differs from that given me here.

I have also been much interested in studying the methods of culture here. As a rule they plant closer than do we, though this is gauged by the richness or condition of the soil. Where the soil is very rich and fine they plant very close. I am not surprised to learn that they cultivate very thoroughly, and plow deeply. I am told by reliable authorities that while it is not common, they do upon occasion, sometimes plow even to a depth of fifteen or twenty inches. Steam and electricty are both used on the larger places in this deep stirring of the soil. The proper thinning and weeding is never neglected, and the millowing of the soil in the early stages of growth is carefully looked after. It is considered very important to leave all the tops on the land as the beets are gathered, as it is known that the most of the fertilizing element are in the tops. Of course some of the mineral ingredients are carried off with the pulp, and as this is fed to the stock, it may be carried right back to make good its loss to the soil. Yet in many cases it goes to other lands, indeed in all cases the growers find that it pays to fertilize. I was interested to learn that in the granite soils of Germany, they often find a sufficient amount of potash, and so do not use a complete fertilizer, but use chiefly bone or rock phosphate and Chili salt petre, or soda nitrate. It is common, I learn, to use as much as 300 lbs. of the former and 500 lbs. of the latter. Surely it will be wise for us, as this matter is becoming so important in our country to carefully experiment to see if we will derive such signal advantages in the use of commercial fertilizers as they have proved to be true in the beet fields of Germany.

Of course the great question of importance is the sugar content of the beets. This year has been one of surprisingly high percentages of sugar. I understand the crop averaged eighteen per cent., and gave at the same time the large yield of twenty tons to the acre. This of course is a fine record. There is much in the seasons to influence in both the quality and quantity of the beets. I find the percentage of sugar ranges from thirteen per cent. to eighteen, and the tonnage varies between ten and twenty per cent. So it will be seen that the sugar content and the crop of the present season touched the maximum. I am told that fifteen per cent. sugar and fifteen tons to the acre are about the average.

Prof. Herzfeld has carefully investigated the worlds sugar harvest, and says that they do not wish American markets, if they can be assured of those of Europe. He thinks America will only produce her own sugar. He is more fearful of the cane product from the West Indies. Already Jamaica comes to England with a large amount. He is fearful of Cuba, in case it comes into the possession of America. He says he thinks Germany has little cause for anxiety in case the island remains independent; but under the spur of American enterprise and push he would feel that her product might become a serious menace to the interests of Germany. Surely here is a hint for the politicians of both Cuba and the United States. I wondered if Prof. Herzfeld realized the rapid increase of sugar factories in the United States and the push of our people.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

THE DEPARTMENT .OF .AGRICULTURE AND CALIFORNIA

I do ont know how other states fare at the hands of the Department of Agriculture, but it would seem as though California was coming in for the lion's share of attention from Secretary Wilson. Mr. Wilson has visited our state several times and is very well informed as to its resources and possibilities and has used the efforts of his department to forward our interests. Among the many things done for us by or through Mr. Wilson, we may enumerate, the introduction and establishment of the fig insect and the making of the production of Smyrna figs here a possibility; for, while much of the credit for this work is undoubtedly due to the persevering efforts of George Roeding, nevertheless the assistance of the Department of Agriculture made possible what it was difficult for an individual to bring about. The establishment of a date experiment station on the desert is another great work for us and one which promises to open a great horticultural industry to California in the near future. The detailing of Harold Powell to instruct our fruit packers in the improved and more profitable processes of handling fruit that it may reach market in better shape, has also been a big thing for our fruit growers. The wine and grape industries have been well provided for in the work of George Hussman, who has been detailed to California in connection with this branch. The establishment of the Plant Introduction Garden at Chico, is another great thing for California, while the sending of Prof. Waite and his assistant, Prof. Scott, to take up the work of pear blight in this state, is yet another big effort in behalf of California fruit growers. These are but a part of the works which have been done for California under the direction of Secretary Wilson, and our farmers and fruit growers cannot but recognize in him a strong friend to their material interests.

* * *

TIME TO FIGHT FUNGUS DISEASES.

Last season there was much complaint as to the prevalence of apple scab, shot-hole fungus, and several other of the fungus diseases, which are often so common and so destructive of the fruit growers' profits. For some reason, there was less peach curl leaf than usual. It behooves every one who was troubled with any of these diseases last season or who even suspects that he is in any danger from them, to take precautionary measures against them at the earliest possible moment. In fighting the whole group of fungus diseases, the remedies have got to be wholly preventive and precautionary. It will not do for the orchardist to wait till the disease has made its appearance before he acts; he does not want to be sure that his trees are affected before he applies the remedies; for as soon as the disease manifests itself the damage is done and remedies are valueless. The disease which manifests itself this season comes from spores shed by last season's growth. These have found lodgment on the branches and twigs of the orchard trees and have lain dormant all winter awaiting the return of spring to awaken them into activity. As soon as the warm growing weather comes and starts the sap of the trees in motion, it also revivifies these spores which soon spring into life, but their active presence is not manifest for some time; at last however, the peach leaves curl, apples and pears crack and their leaves dry and become spotted, the apricots show the spots of the well known shot-hole fungus, and, when all this is seen, it is too late to apply any remedy. Now is the time; now, while the spores shed last season still lay dormant on the twigs, while the leaves are still all off the trees and it is possible to reach every portion with the spray. If the spraying is well done now, most of these spores will be killed and the great part of the damage be stayed, latter spraying are of course necessary, but these to get any spores which may have escaped the first application, but the first thorough spraying in the case of fungus diseases is the one which counts.

Of sprays to be recommended the salt, sulphur and lime is of course the standard winter wash, where an all around wash is desired. It is the only remedy for scales of the Aspidiotus family, to which the San Jose scale belongs, and at the same time is a most excellent remedy for fungus diseases. For fungus diseases only, the standard remedy is still the Bordeaux mixture, used full winter strength and for this we give the following formula:

Copper sulphate (bluestone) 8 lbs.; quicklime, 10 lbs.; water, 50 gallons.

Dissolve the copper sulphate in a barrel containing 10 to 12 gallons of water. Slake the quicklime and thin it to a creamy whitewash. Pour the whitewash very slowly through a wire screen into the copper solution. Stir the mixture thoroughly, and add enough water to make 50 gallons in all. Stir occasionally while applying as a spray to the trees.

In the preparation of the Bordeaux mixture it is necessary that the ingredients should be mixed in a wooden vessel. If an iron one is used the copper will go to the iron and the effect of the spray will be largely neutralized.

Apply the wash cold and as soon as possible after it is prepared. Never allow it to stand over night.

* * *

GOOD CROP PROSPECTS.

Within the past week crop conditions in the north have changed very much for the better. Up to the 11th of the present month, the outlook was a very serious one for the farmers. There had been practically no rain up to that date, for while there had been a few insignificant showers, these had been followed by drying winds until the little good they might have done was neutralized. The whole country was dry, feed was scarce and stock was suffering. In some cases it was reported that early lambs were killed to prevent them from starving. There has now been eight days of almost continuous rainfall, and the season's total has been brought almost up to the normal. The outlook for crops is now exceedingly favorable, although the season will be late.

With the Citrus Growers

BUDDING.

Budding should be done just as early in the season as practicable. Early buds make the best growth during the season and are in much better condition when winter comes. The tops, however, should not be cut off until the weather gets a little warm and growth is active. In budding old trees put in plenty of buds, as there can hardly be too many, and allowance must be made for failure to grow and other contingencies. As said before in these columns, get the best buds from the best type of tree with the most thrifty growth and the best character of fruit, and the result will be an orchard to be proud of.

CARE OF LARGE BUDDED CITRUS TREES.

Orange trees that have been budded during the past season will need constant attention to get the best out of the new growth. Nothing should be allowed to start except what is intended to remain on the tree. These young shoots are very persistent where the tops of old trees have been cut off and will come again and again until they form little projections which send out shoots whenever a favorable opportunity presents itself. Where these projections are very large they should be cut off with a sharp pruning knife. If the young growth on the bud gets spindling or top-heavy, cut back or pinch out the terminal bud which will cause them to grow stocky. The best results can be secured by increasing vigilance.

GOPHERED CITRUS TREES.

If citrus trees are so badly gophered as to turn their leaves yellow, they should be cut back so as to remove all of the fine branches and retain the shape of the tree. Give about 1 lb. of nitrate of soda to each tree, in a basin about four to eight foot across, according to the size of the tree; fill it up with water often enough to soak the nitrate down into the soil where most of the fibrous roots grow. Paint the barked places with a grafting wax made of one pound of mutton tallow, two pounds of beeswax and four lbs. of resin; mix well while boiling and pour into a tub of tepid water and pull until it becomes light in color. Apply it with a brush when warm. Spray the whole tree, from top to bottom with wihtewash and keep it well supplied with moisture. If the tree does not make a reasonably good start and take on a healthy color, pull it out and put in another one. Give it till after the early growing period in the spring, when it will be ample time to replace it, should it not respond.

MAKING LEMON OIL AND ESSENCES.

The lemons, according to the Midland Druggist, are taken to the laboratory and each is cut lengthwise into three slices. The pulp is first removed and put into a press where it is squeezed to obtain the lemon juice, which is sold in its natural state to the manufacturers of citrus acid. The residue of the pulp is used for animal food. The peel is put into large baskets, which are stored in a cool place for some hours when it is ready to be pressed. Each workman holds in his left hand a medium sized sponge of superior quality, which has been previously washed most carefully and thoroughly. Between the fingers of the same hand he also has small sponges to prevent the loss of any of the oil, which is very volatile.

With the right hand the workman takes a piece of peel from the basket, which is kept within easy reach, and squeezes it against the sponge, thus forcing the oil through the pores of the rind into the sponge or sponges. When the sponge is full of essence it is squeezed into a thin lined copper bowl having a lip, which every workman has before him. In order to make sure that the peel has yielded all the essence that can be pressed out by the hand, the overseer from time to time tests the rejected peel by squeezing it close to a flame. If there is any esence left it is forced through the flame and produces a flashlight. One has seen children try the same experiment with the peel after having eaten the orange This is hand-pressed peel, and is then put into brine and sold to manufacturers of candied lemon.

When the tin-lined copper bowl is full it is set aside for a short time to permit the impurities to settle, after which the bowl is surely and carefully decanted and the clear essence emptied into large tin-lined copper-vesels. Before this is put into the various sized coppers for shipment, it is passed through filtered paper. This not only perfectly purifies it, but also gives it limpidity. The quantity and quality of essence yielded by the lemon varies according to season. During November, December and January, most of the essence is manufactured about one thousand lemons being then required to make one and a half pounds of essence. Lemons not fully ripe are preferred, as they yield a larger quantity and more fragrant quality of essence than those fully matured. While a small quantity of essence is made during spring and summer, the product lacks the delicate fragrance of that made in winter.

CULTIVATION.

Towards the end of the month, and when the hardest of the rains are over, cultivation will be in order, where it is not intended to plow again, and after that cultivation at frequent intervals will be necessary to retain the moisture and give access to air and moisture in the soil.

Forest supervisor Lukens says that the Division has over 600,000 of native pine and other trees in nursery now ready for planting this year and next. A force of men are now planting in San Gabriel reserve. The recent rains will make this planting far more successful than otherwise would have been the case. The Division has nurseries at both Pasadena and at Santa Barbara, where these trees are grown under nearly the same conditions as they will be compelled to live when transplanted to the mountain side.

THE IMPERIAL VALLEY.

Five years ago the Imperial valley was a desert waste, without water, without settlement, without development of any kind. Today it gives indications of what is to come. Fully half of the valley has passed into private ownership, and is under irrigation, or is being brought under irrigation, and the remaining lands are being taken up at a rate which insures the ultimate development of the entire valley, but it may be many years before the Imperial country is fully developed.

IT'S PENNY WISE

Valencias

Many growers find difficulty in inducing their Valencia trees to bear a heavy crop consecutive years. Our *expert* can tell you how to make a good crop every year. Let him look over your grove if you are not satisfied with its production.

We have many clients whose Valencia groves never "miss."

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

NEW ZEALAND FLAX.

For general purposes few plants excel in usefulness Phormium termed the "Flax Lily" of New Zealand. It is hardy throughout California and thrives with a fair supply or an abundance of water though not in water entirely. It will stand alkaline soils or where the water supplied is very "brackish." Its variegated varieties are the most popular for the garden and should be more generally planted, for few plants will withstand more abuse or neglect.

THE BUNYA—BUNYA TREE.

One of the most ornate and dignified conifers we grow in California is the "bunya—bunya" (Araucaria Bidwillii.) Because of its sombre hue it should have near it trees or shrubs which will tend to lighten the landscape, and furthermore this tree is unsuited to small grounds, as at maturity it demands at least fifty square feet.

A Bunya-bunya at Stockton.

THE NATURE STUDY IDEA.

"Nature study often sets our thinking in the right direction of our daily doing. It relates the school room to the life the child is to lead. It makes the common and familiar affairs seem to be worth while. Essentially it is not an ideal for the school any more than it is for the home; but so completely do we delegate all work of teaching to the school, that nature-study effort comes to be, in practice, a school-room subject. I wish every parent as well as every professional teacher, could see the importance of first instructing the child in the very things that it is doing and the very objects that it is seeing. The ideal of the parent or the teacher should be to bring the child into sympathetic relation with its world; but whatever may be in the mind or hope of the teacher, so far as the child is concerned the nature sympathy must come as a natural effort of actual observation of definite objects and phenomena."
—L. H. Bailey.

LANGUAGE OF FLOWERS.

Edith—Do you understand the language of flowers?

Ethel—I do.

Edith—Then what does this bunch of rare orchids that Albert sent me signify?

Ethel—That a fool and his money are soon parted.—Judge.

COUNTRY SCHOOL GROUNDS.

A city school may have a beautiful building but can not have very beautiful grounds; a country school may not always have a very elegant building, but every country school can have very beautiful grounds. In spite of this fact, and in spite of the fact that the greater part of a child's most impressionable years are spent there, most of the country schools which we see are a by-word and a desolation. We have all seen them and shuddered. Fortunate are those of us who received our early education in the pitifully few ideal country schools.

There are three objects to be secured, pleasure, education and beauty; there are three methods of securing these objects, judicious selection, respectful letting alone and labor; there are three classes of persons to do this, the women, the men and the youth.

There are some neighborhoods where little is necessary, save judicious selection. There may be a place where our two acres can be secured hills possessed of natural trees and lovely views; having, withal, enough level ground for base ball. If there is such a place in the neighborhood let us select it, rejoice put in some hitching posts to save the trees, and then put our attention and labor on the school house itself. But there are many neighborhoods where there is no such place, and our two acres must be on the treeless plains. Then some labor must ensue.

In front and at the sides of the school house great variety is possible. As many trees of the native California kinds as possible should be placed here. This is not only for beauty but for education. It is said that William Hamilton Gibson when a mere boy knew all the trees of his locality, even in the winter. Not only our city but all our country boys often know few of the varieties in their state. Here is a place which can with little expense and divided labor, be made an arboretum. What if an oak will not be full grown for a hundred years? It will be educating the children who plant it and will cause our successors to rejoice in our existence.

One point seems to me very necessary. While we all believe in co-education, and while the country girl may play baseball with her brother, boys and girls should each have part of the ground sacred to themselves. Behind the school house should be a close hedge, separating the parts and thick clumps of evergreens and shrubbery, thus insuring that independence and privacy which are absolutely essential and are almost universally neglected.

But a school yard should be not only a place for the children but one for the whole neighborhood. It is not feasible in most places to have a separate park, but its school grounds may take the place of one. They should be appropriate for picnics, for Fourth of July speeches, for family outings. There should be a few garden seats. The big boys of the school can make them and would be glad to. There ought to be a box into which to throw papers or odds and ends, that even the country accumulates. The approach to the school can be made more appropriate by planting an avenue of trees.

HOW TO MAKE HOME HAPPY.

A recent purchase of a $2 palm, sickly and frail, caried in its train a demand for a $7 jardiniere and a $3 tabrette. The fire must now be kept up nights for it, and every time the owner's husband passes the palm, he shakes a fist at it.

The best school of the future will be a rural school. The country could, and in time it will, by paying for them, maintain as good schools as the cities now support, and in addition the country school will always possess certain advantages that the city school can not buy if it wants to.

Buy Seed Direct from the Grower
C. C. Morse & Co.
Seed Growers
Formerly at Santa Clara,
now at 815-817 Sansome St, San Francisco
We are the well-known seed growers who operate extensive seed farms in Santa Clara and Alameda Counties and other places in California, and we are now prepared to sell our seed in any quantity, WHOLESALE OR RETAIL. We are prepared to give you seeds of the highest quality only—seeds which grow and seeds which produce the true variety represented. The cost of the seed is a very small part of the ultimate result, whether it affects only your garden or your crop, and the best seed is always the cheapest. We have devoted a page in our catalogue to an article on "Growing Onions for Market," and if you are interested in Onions at all, it will pay you to read it. In addition to a fine assortment of the best varieties, we also offer two new Sweet Peas which will interest anyone who is fond of flowers.
If you are interested in Garden, Field or Flower Seeds of any description, it will pay you to send for our new catalogue. Simply give us your name and the catalogue will be mailed free of cost.

THE ANAHEIM EVERGREEN NURSERIES
Tim Carroll, Prop.
Anaheim, Orange County, California
The Oldest Nursery in Southern California
Established 1868 by the Present Owner.

In the Vegetable Garden

VALUABLE FERTILIZER.

Living near market gardeners the extensive cultivator of fowls should find ready sale at good prices for every pound of guano. In the course of a year this should amount to an item not to be overlooked. If it can be utilized at home for orchard or garden it will be found to exceed nearly all other fertilizers in those essentials to the growth of vegetation. In any event not a pound of this excreta should be allowed to go unappropriated. Keep it in a dry, cool place, if possible, until wanted.

PLANT BERRIES.

Perhaps no one can believe that there are hundreds of families on farms that never have berries on the table to give them a relish for their food and vigorous health for their work, and yet one need not visit many farms to find that there is not a strawberry plant on the place nor a blackberry or raspberry patch in any nook or corner anywhere. Is it because the plants and vines do not thrive with ordinary care as well here as in any other part of the country? Certainly not. Then it must be that these families do not like berries and would not eat them if they had acres of them. No, that is not true. They like them as well as city people, who always make it a point to have them in their season, and would not think of doing without them. If inquiry is made on such farms as to why they have no berries, the answer is invariably that they intend to plant some as soon as they get around to it.

BEETS.

Loose, rich soil with considerable sand is desirable, but beets will grow well in any except a hard, heavy clay. The seed should be planted about an inch deep in drills three and one-half feet apart. When growth has fairly begun thin to six or eight inches in the row. The plants removed may be used as greens. Turnip or globe-shaped are liked best for immediate or summer use; the long varieties for keeping. Leaf blight is occasionally troublesome in beets and may be met by spraying with Bordeaux mixture.

FRUIT FOR THE HOME LOT.

A succession of apples can be had from July to February, by planting Early Ripe, White Astrachan, Yellow Bellfleur, Stump, Brownlee's Russet, White Winter Pearmain, Mo. Peppin, and Arkansas Black. The latter is a dark red, crisp, juicy apple that will keep well.

For pears, plant Duchess d'Angouleme, Coles, Epine Dumas, St. Andre, Patrick Barry and Winter Bartlett. We do not mention Bartlett, as it is so subject to blight that it seems useless to plant it. Butt Winter and Summer Seckel are also good pears. Easter Beurre is a good late pear and is fine for cooking.

For peaches, we would recommend Yellow St. John, Pansy Pabor, Mt. Rose, Lewkin's Honey, Belle of Georgia, Elberta, Wiggins, Gresham, Lovett's White or Thistles Free (both are about the same) and Salway. Henrietta is a good yellow cling for canning. The tree is an erect grower and always bears.

For plums, select Cherry Plums, Rivers' Early Prolific, Ontario, (Green Gage type), Sultan (Blood and more prolific than Satsuma, also more tender, otherwise about the same), Wickson and Apple.

For apricots, plant Newcastle Early, and Royal or perhaps Tilton. The last is said to be superior and more prolific than Royal.

Angelique and White Datatto will supply figs from early summer till frost comes. Negro Large is a good black fig that ripens during the entire summer season, does not sour and is desirable.

For arbor grapes, plant Blue Portuguese (early black), Purple Damascus, Cipro Nero, and Golden Queen. Of the eastern grapes, Pierce, August Giant, Campbell's Early, Agwam.

For short pruners, Cinsaut (dry location only), Verdal, Olivette de Cadanet, Muscat and Black Morocco.

For small fruits, select Gardena Dewberry, Logan berry, Mammoth blackberry, Crandall and Cal. Everbearing (not Oregon Evergreen). For strawberries nothing seems to give the satisfaction in all sections that the Brandwine does, and if you wish but one it will probably do as well as any.

TOBACCO FERTILIZERS.

Potash is the chief plant food necessary to the tobacco plant, not only as a food, but to improve the leaf's burning qualities. Lime, nitrogen, and phosphoric acid are the next most important. Very strong nitrogenous soils, however, do not produce the best qualities in the leaf. A large percentage of chlorine in the soil is bad for tobacco, and will spoil its burn. For this reason, where potash manures are used, only high-grade fertilizers are best, as they contain the smallest percentage of chlorine. The best form of potash to use is the sulphate. Where the soil is rich and the texture of the leaf too coarse, this defect can be obviated by planting closer. Some cigar tobaccoes are put only a foot apart in the row, with 3 feet to 3 feet 6 inches between the rows, to allow for cultivation with the horse-hoe.

IMPORTANCE OF LETTUCE.

Lettuce is our most important salad plant and one of the most varied of our cultivated vegetables. In this country alone it is listed under more than three hundred varietal names and represents more than a hundred distinct varieties. Being in demand at all seasons of the year, it is probably grown under more varied outdoor and indoor conditions than any other vegetable. Five hundred acres, producing about 250,000 pounds of seed, are planted in California every year alone. More than 8,000 pounds of one variety have been used in a single year by one American house.

SWEET POTATOES.

The sweet potato is one of our most important vegetables. It may be cultivated in the garden for family use, or, on account of its qualities for stock feed, it may be grown profitably as a field crop. It thrives and matures in the dryest and hottest weather. Owing to its general adaptability to different soils and climate, its easiness of propagation and cultivation, it is grown, at least to some extent, at nearly every rural home of California.

The varieties are often so mixed when sent to market that the inferior ones make the selling price for the whole, consequently the real cash value of the best sweet potatoes is often not realized.

When it is considered that the difference in the cost of growing an acre is comparatively small, the fact is readily apparent that this vegetable deserves a higher place in California agriculture.

The native habitat of the sweet potato is not definitely known. It is supposed to be of American origin, but we have no authentic account of where and when it was first brought into cultivation by civilized man.

WHEN TO SMILE.

Three little rules we all should keep
To make life happy and bright—
Smile in the morning; smile at noon;
And keep on smiling at night!

PHONES { Home, 1291 / Sunset, Black 1297 Pasadena, Cal.

100,000 Brandywine Strawberry Plants
The very best that skill and intelligent, up-to-date methods can produce. These are Kellogg's strain and have been propagated from stock that was not allowed to bear fruit. We do not plant for ourselves, nor offer for sale, plants propagated from bearing beds. Growing the fruit, and growing the plants, are two distinct operations with us.
It costs no more to fit the ground, plant and care for the best than the poorest. Visit our grounds and let us show you how vastly different is the result. We grow only Brandywines, as out of 20 varieties tested they have stood the test. From February 1st to April 1st is the best time to plant, we think. Orders will be booked and filled in the order received. One significant fact that may interest possible purchasers: We sold $1563 worth of berries from one acre of this strain of plants last year. Raisin Growers Easy.—The raisin growers in the Fresno district have disposed of their product for the past year at figures which, while not all they could wish, are yet better than had been anticipated. With their obligations all discharged and some money to their credit in the bank, the raisin growers of Central California look upon a different picture today than that which presented itself last year at this time.

* * *

Record of the Past Year.—Those who are interested in deciduous fruit growing in California can at the conclusion of any one season generally truthlly exclaim: "The past season was an unusual one," and this exclamation would certainly be entirely true as regards the one just past. No two deciduous fruit seasons in California have ever been exactly alike, and the growing and handling of the product is affected by so many different influences that are apparently far removed from here that even were the crops exactly the same, the conditions for the selling and marketing might be entirely different for the two seasons. This year in addition to the size of the crops and the different varieties of fruit being different from last year, the fruit was some three weeks earlier in ripening, and this of course, had a large bearing on that portion of the crop handled in the fresh state.

The following is a statement of the deciduous fruit shipped in a fresh state from California beginning April 22d and ending November 20, 1905. The figures are for actual carloads shipped, and not estimated ton cars. For comparative purposes I also include the shipments of 1904:

	1904.	1905.
Cherries	209	79
Apricots	97	279
Peaches	559	1946
Plums and prunes	1053	1391
Pears	2186	1013
Grapes	1451	1602
Apples	43	*1744
Quinces, persimmons, figs.	28	17
Total	5626	8071

*Shipments not finished.

* * *

More Funds Needed—The reduction of the flow of mountain streams and of springs by mountain fires has been estimated at from one quarter to three quarters what it would have been had the forest covering remained unburned on the mountain side. There have been many disastrous mountain fires in this State which have greatly reduced its producing capacity. The prevention of these fires has been a serious study with well wishers of the State and especially with those connected with the Forestry Division. Methods of preventing the fires within reasonable limits, may be known, but one serious limitation is before those in charge of this great asset of the Nation. It has been suggested that a great advantage would come to California in general, and to irrigators in particular, if the Division of Forestry of the Department of Agriculture were supplied with funds sufficient to conduct the forestry work and more properly protect this great asset of the State. The average legislator, while anxious to serve his constituents, is at the same time seldom aware of the great need of protecting the forest reserves.

To the end that this need may be impressed, and the advantage to the country appreciated, Mr. Lukens suggests that every one who sees the need of this protection of the forests of California mountains should write representatives and senators, and others at Washington, who may have influence, urging that the need of the forestry divisions be recognized and met by liberal appropriations.

The need is manifold, but principally that greater precaution against starting fires may be taken, that a stronger fighting force may be maintained, also, that more extensive planting of trees on burned over areas may be undertaken.

The recent disastrous fire in Rubio Canyon would have been far more so had not a large force of men been at hand to promptly control it and keep it within bounds, or at least from covering thousands of acres instead of the few hundreds it did cover. This large force can not be provided under the usual conditions unless more money is to be had. In this particular case the force was much larger than ordinarily at the serivce of the forest supervisor, because the property of the railroad was jeopardized to that extent that it threw a large force of workers into the fight, in addition to those in the forestry service.

May Congress see the need of the farmers of arid America and give them relief. Relief which will not only be appreciated by the present constituents of the Senators and Representatives, but which will place them in a position where the next generation shall rise up and call them blessed.

State Text Book Committee.—The public generally does not understand that the State Text Book Committee created by act of law, controls the school books which are used in our public schools. Its decisions are mandatory, therefore, it plays a most important part in the educational advancment of the tSate.

"It devolves upon this committee, says the Sacramento Union, to determine what text books will be used, and to prepare these books either from original writings or from extracts taken from other and standard works. The questions of copyright and of royalties are therefore very numerous, while the possession of sound educational judgment and experience are prime necessities. The State Text-Book Committee is a department of the State Board of Public Instruction, and makes its reports to that board. At the same time it has a statutory existence of its own."

Whether it is wise to invest authority of such unlimited character upon a committee has been the subject of debate in several states where the experiment has been tried, and it is an open question if the giving of such authority does not open the door to graft, for time and time again have changes been made and sometimes proven, too, that local boards of education have profited by the commissions paid them to adopt certain text books for use in the schools over which they have authority. But while such cases are not numerous, they have been serious and have caused the legislatures of many states to turn down a proposition to put the selection of the text books for schools in the hands of a committee.

A glance at some of the statistics furnished by the State Text-Book Commission shows at once the extensive nature of the interests involved. It also shows how rapid has been the educational growth of the State. In 1899, for instance, the total number of books issued was 192,610, of a value of $72,866. These are large figures, but they are entirely dwarfed by those that have followed in recent years. In 1902 the number of books issued had risen to 208,915, of a value of $81,769, while last year the number of books issued was 407,727, of a value of $210, 878.

The book that last year commanded the most extensive sale was the grammar school arithmetic. Of this 93,431 were sold for a sum of $46,710. Next came the intermediate geography with a sale of 69, 048 and this was nearly equaled by the grammar school geography with a circulation of 53,867.

The Cultivator trusts that the Text-Book Committee of California may ever keep before it as of most vital importance, the great responsibility it is under to the school children of the State, and be guided by the highest ambitions which educators should always feel to render the best public service within its power.

* * *

Cannot Do Without It.—The farmers of this country have learned, in the past few yars, the value of the rural free delivery of mails. They have ascertained its value in a dozen different ways and although it has cost on the average a loss to the government of $12,000,000, it has resulted in bringing agriculture to a position of independence never before enjoyed. The fact is it has become indispensible to the rural districts and we never expect to see its use discontinued. Some talk has been indulged in to the effect that the government can not stand the deficit the rural mail creates and that it ought to be discontinued. Our opinion is that should such a bill be introduced in Congress the farmers would rise up in open revolution against it and every congressman who lent his support to the measure would go down in defeat at his next running.

* * *

Farmers' National Congress.—The 1906 session of the Farmers' National Congress will open at Rockford, Tex., October 9th.

At the 1905 session held in Richmond, Va., eighteen resolutions were adopted. They favor any additional legislation which may be necessary to prevent railroads from giving special favors; popular election of United States senators; a parcels post; government aid in suppressing Texas fever in cattle; further regulation of irrigation; national aid for good roads; reciprocal tariff relations; increased appropriation for the Farmers Institute division of the national department of agriculture; and a recommendation that the states not already doing so make liberal appropriations for local institutes; removing the tax on alcohol used for fuel, light and mechanical purposes; a national income tax; increased appropriations for the experiment stations.

* * *

Women at Institutes.—The editor of this paper has been glad to witness the presence of so many women at the Farmers' Institutes this season. It argues well for the interest of these meetings that women grace them with their presence. They listen to the discussion of the instructors, themselves ask questions and often impart information on dairy, poultry, garden and flower topics which are vitally suggestive to the discussion in

We have often wondered why domestic science is not coupled with other topics and a session given over to culinary matters. Nothing would insure an attendance of women like an afternoon devoted to home making in all its departments.

In many sections of the Middle West the fact for years, has been recognized, that woman has her part on the farm just as much as a man and nearly all Farmers' Institutes have given topics of special interest to woman a place on their programs, and many have what are known as woman's sessions. Doubtless these sessions are just as interesting and beneficial to the wife as the regular sessions are to the husband.

The Farmers' Institutes makes a strong plea along this same line urging the expedience of woman's sessions at Institutes as a certain force to create enthusiasism and interest in the work in hand.

"As a rule, farmers' wives stay closely at home, hence it is well that during the slack season they should take this way of meeting together. It does women good to meet together and in this dignified manner tell their experiences, their methods and their plans. The less successful may learn where they have made their mistakes and the stronger gain strength by the telling of their successes. Young mothers have need for the experience and advice of those who have brought up families. Domestic questions always create interest and spread new ideas, while literary questions prove enjoyable. It is nice to have persons who have made special study along different lines give papers or addresses that the benefit of their study may be given to others. The state college sends representatives to give lectures and demonstrations on subjects which are beneficial and interesting to the farmers' wives."

In some communities, as for example, in parts of Iowa, specimens of cookery are exhibited and prizes awarded. This may be a good feature in helping to arouse interest. Public questions are sometimes discussed and this helps in forming good public opinion which is such an important factor today. Townships or localities often work together and a spirit of rivalry is created which induces each individual to work to the best of his or her ability—this spirit is the secret of advancement. When the true object of woman's sessions is understood, they will surely be more common and even become necessary.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The Fresno Republican announces that it has closed its columns against Theo Kearney and W. S. Goodfellow on the raisin controversy.

The Board of Supervisors of San Bernardino county have requested Commissioner Holbbrook to resign. He declines to do so, and the Ontario Record says he is right.

The Pajaronian of Watsonville records the fact of one fruit packing firm that received $123.44 for 59 boxes of Pajaro Valley Newton Pippins, sold in Germany. This was a net of about $2.10 per box.

P. W. Morse, of the P. W. Morse Company of Watsonville, has received a gold medal diploma for three varieties of Pajaro valley strawberries—Malindas, Brandywines and Longsworths—exhibited by him at the World's Fair in St. Louis.

Governor Pardee has received a letter from John Tuohy, a prominent citizen of Tulare county, telling him that in a few days a large petition will be sent to the State Commissioner of Horticulture asking for a State quarantine ordinance prohibiting the importation of grape vines and cuttings into Tulare county.

The orange and olive trees of Mount Madonna are now full of fruit, says the Gilroy Advocate. The crop of olives is large and of fine quality. There is a splendid lot of apple trees of many varieties and the bark of all is as clean as a new pin. The fruit of Mount Madonna is all first class, of good flavor and size and the showing leads to the conclusion that there is no better fruit land in the State than on the summit and slopes of the Santa Cruz range.

T. Harold Powell, pomologist in charge of fruit transportation and storage, United States department of Agriculture has been delegated by the department to continue in California the investigation of the factors which influence the carrying quality of citrus fruit in transportation. The Enterprise says he will make his home at Riverside and his work will be a continuation of that begun on January 1 of last year, and continued till the middle of last June. Last year it was ascertained by preliminary investigation that a considerable proportion of the losses in transit was due to the bruising of fruit from various causes before it is packed for shipment. Mr. Powell accomplished much good by his work last year.

AGRICULTURE.

At the last meeting of the Exeter Lindsay Cantaloupe Association it was decided to order six hundred pounds of the seeds. The association expects to do a very large business this year.

It reads rather peculiar to an easterner when he sees such an item as this reported in the Brawley News. "Harvesting the corn crop is rapidly progressing. The yield of corn is excellent, averaging a ton an acre, with threshed grain selling at $20 a ton. There is considerable corn in No. 8 and No. 5, but owing to the lack of bridges information on the crop in those districts is meager."

Dun's Review for December 1905 says of the value of crops in Southern California: "The estimated value of hay and grain crops totals about $16,000,000. Citrus fruits, $18,000,000. One of the best features of the agricultural development was along the line of market gardening and increased trade in winter vegetables with the Middle West, the value of garden truck sent forward approximating $2,000,000. This includes celery which is now being rapidly shipped."

The 1906 session of Farmers' National Congress will be held early in October in Rock Island, Ill. This beautiful busy city is 180 miles westerly of Chicago, on the Mississippi river. Across the stream is Davenport, Iowa, another place of great interest. The locality is one of much agricultural importance, admirably adapted for the holding of a national farmers' congress. Reduced railroad rates are assured and there should be excursions from all parts of the country to Rock Island October 9. George M. Whitaker, P. O. Box 1332, Boston, Mass., Secretary.

MISCELLANEOUS.

Paso Robbles is to have a bath house costing $100,000.

Monrovia has purchased a fine building for a city hall.

Lindsay is to have a $30,000 hotel. Lindsay is to be congratulated.

Hanford will establish a society for the prevention of cruelty to animals and children. Good.

The citizens of Lindsay are up in arms because of the prospect of a saloon being established in that town.

A convention of newspaper men of the San Joaquin valley has been called to meet in Visalia on Saturday, February 3rd.

The work of laying the last six miles of the Northern Electric between Chico and Oroville has been commenced.

Wednesday, February 7, has been set by the Board of Supervisors as the date for holding an election to decide the question of incorporation for Glendale.

Louis J. Wilde has purchased eighteen acres of land near National City and will endeavor to demonstrate the feasibility of practical silk farming in San Diego county.

The labor troubles in Santa Rosa have been settled by compromise. The terms of the peace agreement would seem to indicate that the labor unions have got it in the neck.—Republican.

The big sawmill of the Diamond Match Company at Stirling City, which was compelled to shut down owing to the bad weather the first of the month, has resumed operations.

Says the Hollister Free Lance: The recent storm has been of inestimable benefit to the orchard and alfalfa farmers of this section. Prospects for a season of plenty were never better.

The Hanford Journal has issued a special edition for immigration purposes, and it contains a very comprehensive presentation of the resources of Kings county. The Journal is a fine paper, always up to date.

The Oxnard Courier says, California and more particularly this section of it, has never had a more prosperous outlook for a prosperous year.

Californians are ruthlessly impairing their magnificient climate by destroying their magnificent forest growth, while 600 Texas farmers have formed a club to plant trees on the Staked Plains.—Sonoma County Farmer.

The concrete and earthen dam of Dr. Roca at San Felipe, which was built at a cost of $40,000 was washed out. The San Felipe and tributary creeks are higher than they have been in six years.

It is said that there is enough natural gas escaping from the oil wells in Brea Canyon, southwest of Chino, to supply a dozen cities. The owners of the property have made a proposition to supply Fullerton with the gas.—Chino Champion.

Pomona is forging ahead with civic improvements to the admiration of the entire county. Landscape gardeners are beautifying public and private grounds, the streets are being oiled, trees planted and property has gone up 25 per cent. as a result of the energy displayed by the people.

Sugar eaters and local stockholders in eastern sugar companies are agitated over a gaint combine in sugar about to be effected. It is claimed the Standard Oil people are to be the controllers of the sugar market. This would affect the beet sugar industry and sugar prices in general.

The Boulder Creek Echo is authority for the statement that the recent storm beginning January 11 and concluding January 19, was the heaviest ever experienced there in the same length of time. The total precipitation for the season is 34.72 inches, as against 30.08 inches to the same date last season.

The Kern County Land Company and all the allied canal companies today filed a suit against the Associated Oil Company and each and every oil company operating in the Kern River field and judgment is asked to take such measures as will protect the river from the accumulated and waste oil that now or may find it way to the river.

The entire California delegation has had a conference with Percy T. Morgan, president of California Wine Association, regarding the proposed amendments to the existing laws regulating the sweet wine industry. It is now proposed to press a bill for the amendment of the law, so as to relieve wineries from the income tax now imposed.

A new way of exterminating gophers has been officially published by the government of France. By the use of a certain virus, a disease similar to typhoid fever is communicated to the animals. The disease is very contagious and 95 per cent of the pests die within two weeks. The cost of extermination is put at 40 cents an acre and the work is done in the spring.

A whale measuring some 20 feet in width and 75 feet in length landed ashore on the beach about half a mile north of the wharf at Port Harford quite recently. The monster is the largest ever seen in this section For over three hours inhabitants in the port watched the hugh object as it floated around in the bay, until it finally beached. Fishermen have made it fast to the rocks with long ropes.

LIVE STOCK.

The Fresno Poultry, Pigeon and Pet Stock Association has selected December 12 to 15th, 1906 as the date for holding their annual show.

San Luis Obispo County stockmen are forming an association to purchase several carloads of Hereford cattle with high grade bulls to bring up the character of stock in that county.

The Dairymen in Sonoma County have agreed to put their dairies in first class condition so that the milk inspectors may not be able to condemn their milk on account of excess of bacteria.

The buildings of the Pocket Creamery a few miles below Sacramento were burned last week. The plant was of the most modern type and capable of the maximum production with the minimum of labor and expense.

A dispatch from Anderson says: "The season at the Battle Creek Fishery has about closed. There are still 10,000,000 salmon eggs on hand, part of which are being shipped to the Sisson Hatchery, 1,500,000 being shipped at one time."

In Kings County a movement is on foot to ship in several hundred high-grade Hereford heifers with a view of starting a new class of beef cattle on the Coast. These cattle, as is known, are great rustlers and fatten on less stuff than any other type of beef stock.

The largest striped bass ever taken from the Sacramento in this vicinity and very likely the largest ever taken from that stream, was landed Thursday afternoon by Sam Neal. The fish measured three feet and weighed just sixteen pounds and netted Mr. Neal $1.50.—Colusa Sun.

The Ukiah Times has the following item concerning stock conditions in Mendocino county: "The winter is proving a very hard one on stock. Most of the farmers have fed out all their hay and there is no grass on the ranges. There is sure to be a great loss in both sheep and cattle.

The statement has recently been made by the Napa Journal that the hens' eggs produced annually in this country would fill 43,127,000 crates of the capacity of 360 eggs each, and that a train made up of the refrigerator cars necessary to carry them would be nine hundred miles long.

The Orange News states that the Orange County French Coach Horse Company recently received from France the coach stallion "Coraim." This fine horse is a rich mahogany bay, four years old next May, and weighs 1,450 pounds. He arrived from France about two months ago. The price paid for him was $3,600.

The Sonoma County Co-operative Poultry Association awarded the contract for purchasing its eggs for 1906 to the Sonoma Fruit and Produce Company. The price at which the eggs are sold are top exchange quotations for No. 1 eggs, less 5 per cent commission and top quotations for No. 2 eggs, less 5 cents per dozen, without commission. The minimum price for eggs during the cold storage season is fixed at 18 cents. This is much better than the price obtained under the contract of the previous year.—Sonoma Farmer.

Some recent tests of Holstein-Freisian cows resulted as follows: Rosa Bonheur Fifth, in a six weeks' test produced 135.95 pounds of butter, or a daily average of 3.23 pounds. Belle Sarcastic, in a six weeks' test, produced 136.88 pounds, or a daily average of 3.26 pounds. Houtwje D., in a six weeks' test made 120.65 pounds of butter, or a daily average of 2.87 pounds. It will thus be seen that these three cows made an average of three and twelve hundredths pounds of butter per day for a period of six consecutive weeks, or fifty-five one hundredths of a pound of butter per cow per day in excess of the best cow at the World's Fair.

SUCCESS ASSURED.

No objections raised by individual Congressmen or Senators can permanently check the progress of the great movement for national irrigation. It has got beyond that stage. The purposes of the movement are now too well understood by the people, the press, and by many enlightened members of Congress for its progress to be permanently blocked. The success of a movement that is so desirable, so reasonable, and so profitable to the nation at large, is only a question of time—and of a very short time.—L. A. Times.

Pomona will soon become the most beautiful city in Southern California. The money spent in fine schools, beautiful parks, well graded and shapely streets and avenues will bear good interest in the constantly increasing stream of home seekers who are hunting the right place in which to locate.

LINER ADVERTISING

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

LUMPY MILK.

Editor Cultivator: I have a cow, half Holstein, half Jersey from whose cream we are unable to make any butter. I bought her about four months ago (she was then some three months with calf) and we made then as nice yellow butter as if she had been a full Jersey, but pretty soon her cream became foam when churning it, so that if we put a gallon of cream in a 3 gallon churn and churned it some 15 or 20 minutes the churn got full with a white foam resembling beaten whites of eggs, and did not make any difference how long a time we churned it would remain that way and nothing else. We use a churning thermometer and we have tried all kinds of preparations but the result is the same. She is now two months from calving and I notice the closer she gets to that period the lumpier the milk becomes, so that it is now impossible to strain it any more because the strainer gets clogged up with small yellow slimy lumps. I also noticed a day or two ago that the first milk coming from her fore teats is lumpy. My neighbor has a full blooded Jersey cow who has the same disease as mine, only he claims his has small pimples or sores on her udder while mine is perpectly healthy externally as far as I know. I bought the cow with the understanding that I can trade her for another one when she is fresh, but if I can find some remedy for this I prefer to keep her as she is a heavy milker when fresh.—J. B., Chico.

Give your cow twice a week or oftener if necessary, a pound of Epsom salts with a tablespoonful of ginger as a drench, use water liberally with it to have the full cleansing action. The cause at first may have been a slight cold, but more than likely the cold mornings may have caused the milker to hurry too fast and not milk the cow clean. Then the low temperature gave the bad bacteria every chance to work into a mass in the milk. While the friendly little lactic acid bacterium was killed by the coldness, now if this condition cannot be controlled warm the newly drawn milk by adding hot water at a temperature of 100 in pans that are also warm, set the milk in a cool room and skim as quickly as the milk clabbers, from this on follow the directions given to J. M. P. It may be well to dry this cow off at once and when she comes fresh she should be lightly milked for the first twenty-four hours, only as much being drawn as the calf would take and at three or four intervals during the first two days, she is the kind of cow that one fears will have milk fever.

In regard to the sore teats of the neighbor's cow, this is probably cow pox, and each spot can be touched with butter of antimony, after milking and washed off before milking again. We use in our herd castor oil or carbolized vaseline, except in severe cases, then the butter of antimony usually two or three applications ends the trouble; if the teats are very sore a milking tube is humane.

* * *

MILK PLETHORA.

Editor Cultivator: Have a mare ten years old. She is with foal; will be ten months the 23rd of Jan. Has made bag a month or more; it is just bursting with milk, and at times it flows from the bag. She is fat and eats well, will you please tell me the cause of this flow of milk? Will the mare lose her foal.—F. H. B., Tulare.

In mares the ninth month is not a dangerous point as a rule, though injury may cause loss of foal. The milk flow in this case seems to be from plethora, the result of over-feeding and probably lack or exercise. Reduce the hay feed to twice a day and limit the quantity; give a little bran; enough to keep the bowels open. Give her daily exercise, either light work, or else a mile walk in harness or behind a wagon; let it be slow, and on even footing. We have had several cases among our draft mares and have not had bad results from the early filling of the bag, only watch it and do not let it abcess, but milk it out occassionally.

* * *

RANCID BUTTER.

Editor Cultivator: Please state why butter becomes rancid in twelve hours after being churned from fresh cream.

The family cow seems to be in perfect health and is fed bran and barley twice a day, night and morning, the rest of the time she is on green pasture which consists of green grass only.—J. M. P., Lakeside, Cal.

The trouble you are having is not uncommon during this period of the year in California. Try setting the milk in pans that are warmed and have a pint of warm, not hot water in them, after straining the milk into the pans put them in a cool room. This is the well known plan that many of the farm dilution separators work upon. Skim the milk as soon as the clabber forms. Stir the cream thoroughly when adding each new lot, and churn twice a week; if the cream will not hold that long it can be kept back by adding a little salt to the first lot put into the jar. The night before churning time, examine the cream; it should be slightly acid and look smooth, if it is still sweet, warm it up to eighty degrees by putting the cream jar in a pan of warm water, then cover and stand it where it will cool slowly. Now, before beginning in this way, it would be well to have a general cleanup to destroy the bad bacteria that are now in control, wash everything used, the tinware should be scalded and washed with strong sal soda water, then with scalding, it should be free; the churning and wooden things are washed, and have a weaker solution of soda used. After that use some lime water to soak them in for a while. This may seem considerable trouble yet I have found no royal way to do things in a dairy only to keep eternally at it, in the way of keeping the bacteria at bay.

DRYING UP THE COW.

Editor Cultivator: Will you give me some suggestions along the line of drying up my Jersey cow? She is now within sixty days of dropping her calf and the flow of her milk increases, if anything; some times showing a ropy symptom. She is a high priced cow and I am worrying about her refusal to dry up. She is thin, of course, but healthy.

This is a difficult question to answer briefly, for so many things enter into the problem that a newspaper reply is necessarily unsatisfactory. There are a few general suggestions, however, which may be made to all such cases, but to specific ones we would advise writing Mrs. M. E. Sherman, Fresno, the Cultivator's dairy editress, who is the best authority we know of on this subject. But along the general line of discussion it may be said:

"The more highly developed the dairy cow becomes the more important is it to give her more consideration at the close of the lactation period. Frequently a cow is supposed to be thoroughly dry, and turned out into the dry pasture when she should be kept with the cows that are giving milk, and until all secretions in the udder have stopped. It is a mistake to permit the udder to retain any thick, mattery substance; for, undoubtedly many cases of udder trouble can be traced to not removing this substance from the udder. Moreover, it is not well for the animal to absorb this material into her system.

Occasionally, there are cows that persist in giving milk for two or three years without any rest periods of lactation. In such a case, it is better not to force her dry but continue milking. If a cow is forced dry there is danger of desrtoying a portion or all, of the udder.

About three months from calving time most cows begin to decrease in milk flow rather rapidly, without de-

Sharples TUBULAR CREAM SEPARATORS

We want you to know Tubular Cream Separators as they are

Investigate the low can and enclosed gears. Tubulars have neither oil cups, tubes, nor holes—they oil themselves. **They have bowls without complicated inside parts—hold the world's record for clean skimming, durability, capacity, easy turning and easy washing**—save half the work--greatly increase the amount and quality of butter—are wholly unlike all other separators. 9 and 11 Drumm St., San Francisco 107 First St., Portland 112 2nd Ave. South, Seattle

These two tubs of butter were made from the same quantity of milk from the same cows

How was it done? Here's the story in the words of a plain honest, hard-working farmer and his wife.

RAYMOND, NEBR., JUNE 6, 1905.

We had a water separator, and from twelve cows we made 36 lbs. of butter. The next week we used a No. 6 U. S. Separator and made 74 lbs. from the same cows in the same pasture without any extra feed. We made $10.45 the first week after using the machine. We are very much pleased with it, and could not do without it now.

JOHN NEYLON,
MRS. NEYLON.

Are *you* using any gravity method to skim your milk? If you are, a

U. S. Cream Separator

will do for you what it did for the Neylons. Think what that means—a considerable daily saving in the time and work of handling your milk—from ⅓ to ½ *more* butter than you are now getting, and *better* butter, too, that brings a *higher* price. You can't afford to put off looking into this matter another day—write us *now* for a free catalogue, which explains just what you want to know.

creasing their grain allowance, while others will go dry only when the grain portion of their ration is reduced and some milk left in the udder after each milking.

It is not the poor dairy cow that gives us any anxiety at this time, but it is the heavy milking animal whose udder we wish to preserve that makes us inquire as to the best method to pursue. There can be no hard or fast rules laid down for the feeding and handling of the cow at this time, but, as a rule, a decrease in the grain allowance usually is effective in reducing her flow of milk. If the cow is thin in flesh, it is seldom necessary to make any change in the system of feeding, but her milk flow can be reduced by leaving a small amount of milk in her udder after each milking, and after pursuing this method for a week, milking the cow once a day is usually sufficient.

Of course, a great deal depends upon the cow, and the system pursued in drying her off should be modified according to circumstances. The cow should be dry from six weeks to two months, and it should not take longer than two weeks to thoroughly dry the cow up, but under any condition, all, or nearly all,, of the udder secretions should have ceased before she is turned out to receive no more attention. It will not stimulate the flow of milk to remove all substance from the udder when she is nearly dry. If she is thin in flesh she should be well fed until she is in good condition for her next year's work.

"Hobbs, I think your boy will become a very distinguished man if he lives long enough."

"Yes? And what do you think he will be distinguished for?"

"Longevity—if he lives long enough."—Tid-Bits.

EARLY DAYS WITH STOCK.

The pioneers, men who were identified with California in its early days, say from '49 to '80, are rapidly passing away. Some of "the boys" of those days are past the meridian of youth now and the stories they tell of the incidents in the formation period of California are interesting reading to the present residents, native and, otherwise, of the State.

One of the men who knew much about California in the days mentioned was J. E. Pleasants, of Orange county who relates in the Citrograph how they raised horses in this country 50 years ago. He writes:

"From the settling of California by the Spanish to 1863 the principal industry of the country was stock raising, chiefly horses and cattle, as up to that date sheep were raised in comparatively small numbers. The horses were generally understood to be of Andalusian stock, introduced from Spain into Mexico and thence to California. The horses of California were superior to those of Mexico, probably owing to the difference in climate and feed. It has since been proven that in the rearing of blooded horses that California climate is a strong factor in making the bone and muscle necessary to the speed and endurance required to compete with the world's record breakers. And for beauty, spirit and endurance, I have never seen the old California horses surpassed, even by blooded stock. I have know many a horse to be ridden a hundred miles a day without injury, and fed entirely upon wild grass. Indeed, I belive that the horses fed entirely upon the native grasses possessed greater endurance than those fed on grain. Their hoofs possesed great durability. Saddle horses were never shod, and suffered nothing in consequence. The greatest care was taken in breaking and training the saddle horses. There has probably never been better trained or more beautiful saddle horses in any country than those of California at that time. The work and travel of the country was done on horseback; so the saddle horse was an institution. All the men and many of the women were expert riders. The horse and all the equipments of the horseman were matters of especial pride. It was usually considered that it required a year's time to properly bit a horse. Then a mere touch of the rein served to guide him. The shades of color and markings of stock all had their names. It has been estimated that the Spanish language contains at least two hundred names for the colors of stock. There are many colors for which we have no synonyms in English.

During the early sixties there was more stock in the country than had ever been at any previous time. The Stearns ranchos alone at that time branded from 5000 to 6000 head of calves a year; and many rancheros counted their yearly increase by the thousand.

Nearly the whole of the southern part of the state was used as grazing land. Around Los Angeles, the missions, and along the rivers there was a limited amount of farming and fruit raising done, but the balance of the land was one great pasture. The old method of managing stock was very systematic, though done on a large scale. Each rancho had its mayordomo, and under him served a corporal. Then came the regular vaqueros, who numbered from ten to twenty for each rancho, according to the size of the place and number of stock to be handled. During the spring rodeos there would be twice that number employed. The business of the vaquero was to look after the stock and break saddle horses. As a rule, this work was light and his wages small. Fifteen dollars a month was about the average. Each vaquero had his own caballos de su silla, or saddle horses, allotted to him, and no man rode another's horse. Enough horses were allotted to one man to make the work light for the animals. A horse was never ridden two days in succession during the busy season, and one usually had several days of rest to one of work. In this way they were kept in excellent condition the season through. Horses were kept in separate bands. A manada or band of mares and quite young stock, would usually number from forty to sixty. These would be under the leadership of a stallion. Each horse would keep his manada to itself, and while they usually avoided each other, when two old leaders did meet there would be a fight worth seeing. The young geldings and fillies remained with the manada until the fillies were 2 to 3 years old and the geldings 3 to 4.

The fillies were put at the proper age into a newly formed manada; and the geldings were taken away to be broken. Mares were never used to work or ride. In the spring the young horses (potros) were put into a band by themselves under the leadership of a bell mare (caponera). They were herded for a time until they grew accustomed to the new leader. They were now apportioned out among the vaqueros for breaking, each man taking a number, riding and gentling them in turn. They were also broken to stake. Broncos (wild horses) were ridden for some time with a hacima, a sort of halter, before using the bit. Quite strict observance of ranch lines was kept. The boundaries were well defined and recognized; and though the stock roamed frequently from one rancho to another, one ranchero or his men must obtain permission from the owner before driving stock away from his land. In the spring, varying in time with the season, came the rodeos, or round-ups. There were never begun until feed was plentiful and the stock in good condition.

UP-TO-DATE CATTLE RAISING.

Henry Miller is the greatest cattle raiser in California, a man whose ranches extend from the Tehachapi to Oregon, and who cannot tell how man cattle he has, even it he did want to help out the assessor. There is hardly an old cowboy in California who has not worked for Miller and Lux. Jim rode for them when he was a boy, and he would rather "take a cussing" from Old Henry Miller than ride for the politest cattleman in the San Joaquin. But if Miller and Lux trained the old school of California cowboys on the open plains, they also, with their barbed wire fences, and branding chutes, did their part to change the rope-swinging cowboy into a hired man. Henry Miller noticed that after a grown steer had been roped and "busted" he would get rough, and perhaps lose weight for a month; and as Mr. Miller's object is to fatten his cattle, he is reported to be willing to fire any man who puts a rope on one of his critters except to drag him out of an alkali hole. With this sentiment abroad, you will find no steer-tying contests in California; and, for that matter, the sport is none too popular among the cattle owners of New Mexico and Arizona. —Dan Coolidge in Sunset Magazine for January.

FEED ALFALFA.

Editor Cultivator: Please inform me in your next issue what I can do to keep horses from gnawing the bark of cottonwood trees in my pasture. I have painted them with crude oil last year, but the horses do not pay much attention to it, besides the oil is injuring the trees in the hot weather.—F. K., Imperial.

Your horses are needing some green feed. In its absence give them some alfalfa for a time. Mix one spoonful charcoal (powdered) in bran once a day for three days. Do not feed entirely on alfalfa but mix it with barley or whatever you feed for roughness.

Poor Freddy.

Reggy—Why does Freddy have so deuced many broken cigars in his vest pocket?

Clarence—Sh! Freddy wants the chaps to think he hugs so many girls, so he breaks the cigars and puts them in his vest pocket every evening.—Chicago News.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

EDITOR'S QUESTION BOX.

The Editor's question box is so full this week that it will be impossible to crowd in the usual articles without crowding out the important questions that many wish to have answered.

* * *

Chicken-pox.—(Mrs. T. M., Ontario.) Would you please tell me what is the matter with my chickens. They have a yellow substance in their throat and mouth. I have put sulphur in their throats. They don't seem very sick unless there is a good deal of it. Yesterday I discovered some of my hens were beginning to have little sores break out on their combs and heads and around their eyes. One seems nearly blind her eyes are so bad. It is something like swell head that chickens have sometimes, but their heads are not swollen at all. If you could tell me anything to do I would be very thankful. I have lived here 16 years and never had any sick chickens before. I think so much of my poultry I do hate to have them get sick. What do you think could be the cause?

Answer.—Your chickens have the chicken-pox. It is caused by a germ something like the chicken-pox of children. It is very contagious, and affects both young and old. The germ usually enters in a small wound on the head, and it has been supposed that the bites of fleas, lice, mites or ticks give an entrance to the germs. These germs are more numerous in damp weather and multiply in leaky houses and moistened droppings.

The treatment consists in keeping out all infected fowls, disfecting by whitewashing or spraying the houses with a solution of five per cent carbolic acid. Apply carbolic salve or carbonated vaseline to the sores. Feed a nourishing diet, one third being cut clover, and add a little sulphur to the mash.

For the yellow substance in the mouth swab out with peroxide of hydrogen, and if they are not well in a week try sulpho carbonate of zinc, four grains to the ounce of water, painting the yellow growth with this.

I think within a week all your fowls will be well.

* * *

Running at Eye.—(W. B., Montecito.) Will you kindly tell me through your paper whether over feeding and fat will cause trouble with chickens, as I have a pen of Black Minorcas and several have a running at the eye this last week. Is it over feeding or what is the cause; everything clean and a good house and feed mash in the morning of half bran and half Coulson Egg Food, mixed with skim milk and grain rations, consisting of half wheat and half barley for the rest of the day; they are very fat and ten months old.

Answer. The running at the eye is not caused by over feeding; it always comes from a cold in the head. Your hens have been in a draft of night air, possibly a crack in the house near where they roost (if so, mend it) or during the day they may get in a draft under the barn, or they bunch up at night, get sweaty and in the morning the cold air chills them.

Pour a cup of coal oil (kerosene) into two quarts of cold water; the oil will float; dip the hens' heads slowly into this and hold it there while you count three. Give her a bolus of the following mixture: 2 tablespoons, 1 oz. lard with 1 tablespoon of mustard; 1 of Cayenne pepper; 1 of vinegar; add flour enough to make stiff dough; give a bolus as big as the first joint of your little finger. I think this will cure in two days.

* * *

Co-agulated Whites.—(Subscriber, Glendale.) Since coming to California we have had a peculiar experience with eggs. Although we get them fresh every week from a neighboring ranch where the hens apparently have everything conducive to the production of the best eggs, we often find one in which the albumen is partly coagulated or has a milky appearance, it sometimes amounting to almost a semi-transparent membrane Often there are none in a dozen and then there will be one or more and in two or three consecutive dozens some two weeks ago there were four in each dozen, which as we do not use them made eggs rather high when forty-five or fifty cents a dozen. The people who raise them do not know the cause and use the eggs, but we are squeamish. Can you give any information about it? I think, though we have not carefully observed that the trouble is worse in the fall.

Answer. I have frequently observed this in eggs that have been preserved for fall and winter months, by the lime salt process, and I feel sure that you are buying eggs laid sometime when eggs were cheap and plentiful and kept till they are a good price. You say the trouble is worse in the fall which confirms my opinion.

* * *

Brown Leghorns, Grit, Etc.—(C. H. V., Pomona.) I began in the chicken business on a small scale about two years ago and have been following your advice since we began taking the Cultivator two years in April. I feel that I have done very nicely. I have tried several breeds but have given all up for Brown Leghorns.

Possibly you remember I sent in several lists of questions a year or more ago and now I want to trouble you again. I have heard that some of the poultrymen in the north feel that little chicks do not get grit enough at first so their first meal is grit put in warm tallow and stirred until cold. That they are fond of the tallow that forms around the grit. What is your advice?

Would it do any harm to pin cheese cloth or a piece of burlap over the one that is tacked on in the nursery of the Cyphers incubator to keep it from being soiled at hatching time.?

How long to Brown Leghorns need heat, providing they are feathered out and can tell male from female? I am running 19 females with one cock (Brown Leghorn), is that too many?

Answer. I would advise your giving little newly hatched chicks coarse sand or fine chick grit for the first meal. I do not think the tallow would benefit them at all and it is an extra trouble. It certainly is not following Nature's plans.

You can put a piece of cheese cloth over the burlap, but nothing thick. The best way is to remove the bottom after each hatch; take it out of doors, brush thoroughly and sun it. If necessary it can be washed and at the end of the season I always replace the burlap with a new one.

It depends upon the season, the weather, and the vigor of the chicks how long they require heat.

Nineteen females to one male in the Brown Leghorns will not be too many if the male is young and vigorous.

* * *

Klondikes.—(H. O. Alsbach, Santa Ana.) I recently read a description of the breed of chickens known as Fluffs, formerly called Klondikes. They are said to be splendid layers and table chickens. Pullets commencing to lay at four to five months old and as a table chicken they have no superior. It is also stated that they unable to fly and can be

English's Golden Laced Wyandottes

confined by a two or three foot high fence. Will you please tell me if the assertions are correct and also if the chickens are hardy and will thrive in this locality? If so, will you kindly give me through the California Cultvator, the address of the nearest breeder who has eggs for sale, from the white variety of said fowls and oblige the above signed.

Answer. I have read of these fowls but have never seen any. There were nóne at the Poultry Show this month.

If any of our readers can reply to this letter of H. O. Alsbach, I shall be glad.

* * *

Fertility of Eggs.—(F. C. B.) I am running a strain of Black Langshans and for breeding purposes; I have in each pen with a ten month old Cockrel, ten hens one year old.

Very recently I started up an incubator with the eggs from this stock, and on the first testing I found one-half of the eggs were not fertile.

I cannot believe that it is their feed as they are all doing nicely every bird is in a perfectly healthy condition and looks finely.

Then, too, I am running another strain of birds and they are all doing well and their eggs seem to be very fertile, at least the percentage of fertile eggs from this strain run as high as any one could expect. We mix a little rich pepper with the morning mash two or three times a week at this time of the year, is their any chance of that being a detriment to breeding stock?

The writer would appreciate any advice or suggestions that the Cultivator might offer through its columns

Answer. Before receiving your letter I had prepared an article on the fertility of eggs, this will either appear in this week's paper or the following week. It deals more fully with this important subject than would be possible in a letter.

The usual rule for mating up for fertility is in the Mediterranean class twelve to fifteen females to one male. American class eight to twelve. Asiatic class six to eight. These last are the heaviest birds and much less active than the others. It much depends upon the vigor of the male. If you are trap nesting your hens you will discover which hens are laying infertile eggs, remove those to another pen and give them another mate. Red pepper should not be fed to a breeding pen; give instead rather more meat. See article on this subject.

* * *

Indian Runners.—(Mrs. J. L. H.) I have two Indian Runner ducks. They are about ten months old. They lay about three eggs and then stop and do not lay for a couple of weeks. So will you please state the reason in the question box of the California Cultivator. I have taken your paper for a year and am very much satisfied. When is the proper time to pick Indian Runners? and how often do you pick them? How many eggs should one duck lay?

Answer. You are not feeding your ducks right. The ducks need a certain amount of food to keep them alive, then the surplus goes to making eggs, if it has the proper elements of the egg in it. Yours lack something, so that it takes the duck nearly two weeks to save up that which is lacking to make the egg. As you tell nothing about food I can only make a guess that you are not giving the material to make the egg shell.

Give plenty of finely crushed oyster shell to make the shell; give plenty of animal food and green food, only a little corn, or corn meal in the mash.

I never pick Indian Runners because they are great egg layers and fowls cannot make both feathers and eggs at the same time. Ducks can be picked about everey two months.

My Indian Runners, when properly fed, gave me two hundred and thirty three eggs per year.

Minorcas and Rocks.—(L. S. S., Cupertino.) Will you please tell me through your Cultivator of some reliable poultryman that has Black Minarcas and Barred best laying strains. Will you please tell me which you think are the best Rocks, as we want them from the laying; the White Minorcas or the Black Minorcas?

Answer. Look in the columns of the Cultivator for answer to your question.

Oxford Poultry Farm
Pure-Bred S. C. White Leghorns
One of the Largest, Yarded, Exclusive White Leghorn Poultry Farms on the Coast
Can furnish eggs for hatching from two grades as follows:
The First-Grade Pens are formed from birds in their second season, only the choice specimens being selected. These are the prolific layers with good carriage and color and strong points throughout.
Price per setting of 15 eggs, $2.00; 100 eggs, $7.00.
The Second-Grade Pens are formed from birds in their second season, containing only the ones that are strong in both shape and color. Exceedingly good layers for the grade. Equal to many first grade birds.
Price per setting of 15 eggs, $1.50; 100 eggs, $5.00.
Choice Breeding Hens For Sale. Address
H. R. LANE, HANFORD, CAL.

BREEDING BARRED ROCKS.

There is today probably no variety of thoroughbred poultry which has commanded so much study and scientific breeding to produce highclass specimens as the Barred Plymouth Rocks. In the first place the selection for the breeding pen is indeed no easy task, as those of known ancestry must be used in order to get the proper start and lay a foundation upon which to build, as no matter how hard you try or how careful you breed you cannot produce fowls of a high grade unless you first get the right start.

Chance birds are of little use as breeders, as they will not often reproduce themselves, and a whole season's breeding is lost no results accomplished, for your time and trouble, all of which goes to show that ancestral backing is a very important factor. This is not only true of Barred Plymouth Rocks but of any other variety of thoroughbred poultry which you may be interested in.

While what has been said above is very important for successful breeding, cleanliness is one of the first essentials to success in raising poultry, and this not only means to keep your houses and yards in a cleanly condition, but your fowls free from vermin, with comfortable, dry houses, and free from drafts.

A Pair of Barred Rocks

In the breeding of Barred Rocks today there is employed what is termed the single and double mating, some breeders desiring one method and other breeders the other, but it has been demonstrated by the foremost breeders of this variety today that the double mating system has produced a higher percentage of first class birds than the single mating

In the double mating system, to produce highclass males, the pen should be composed of an exhibition male, narrow barred, even color, and of standard weight, and to him should be mated females of the same line of breeding, several shades darker than the standard color, always keeping in mind the idea of offsetting the defect in the male with that of the female, or vice versa. For highclass females, select a male of medium light color, and even from head to tail mate with females of standard color, closely and evenly barred, down to the skin.

From the above matings you should produce a good percentage of highclass males and females.

I have been breeding this variety for over 11 years, and have yet to find a fowl more desirable for all general purposes.

In the former part of this article I referred to the fact that in order to get satisfactory results, birds with proper ancestral backing should be procurred, and this can be done by getting stock or eggs from a reliable breeder, and one who has made a reputation for himself not only in the show room but for honest and square dealing.

Whatever you get, get the best, and while it costs you a little more in the beginning the results in the end are far more satisfactory.

,And finally let me say, that with a good start, from a reliable breeder, cleanly quarters for your birds, and careful judgment on your part, you cannot help but be ultimately successful.—H. R. Campbell, Petaluma.

PIGEONS AT THE POULTRY SHOW.

The pigeon department at the late show held in Los Angeles, Jan. 8-15, 1906, was the best display of fancy pigeons ever brought together in Southern California, while the number was less by 81 to the number cooped last year, the variety was greater and what was short in numbers was more than made up in quality. The pigeon fanciers were well pleased with the exhibition in every detail. Judge S. Tyler, of South Pasadena who placed the awards, in commenting upon the birds said, "take the show all the way through, I never had the pleasure of handling better stock." Wilbert E. Foster, superintended the exhibit.

Many of the classes were extraordinary well filled and competition was especially keen in the Dragoon and working Homer classes. The Dragoon class was filled by J. C. Garvey, Wm. Huber, Martin Smith, E. G. Waltz and John Brenton. White and black Dragoons were heavy classes in both sexes, 10 birds each class. Working Homer class were filled by E. V. King, E. G. Waltz, Geo. Kammers, J. C. Garvey and the Olive Lofts; these classes were the best filled of any class in the show, Blue Barred running as high as 12 birds to each class. The judge had to take considerable time in choosing the winner, they run so even in all points it was difficult to award premiums.

The Maltese hen pigeon display was the finest ever given in California. The fanciers filling these classes were W. H. Elliott and Olive Lofts. Mr. Elliott carried off the lions share of prizes. This variety of birds is becoming very popular and will give the little Homer a merry chase for first place in squab breeding for the market. They breed equally as fast and give much larger squab; their main drawback is that the ordinary breeders cost so much more than the Homer. The English Runt class was not so large as last year, but made up in quality what was short in quantity. Pouters were out in full force and were no doubt the best display of this variety ever made this side of

YARDS—CORNER MOORE AND CHAPMAN STS.

the Rockies. E. Foster and Martin Smith were the fanciers showing them. The Parlor Tumbler entry was as large as ever seen at any Eastern show and drew a great deal of attention from the fact that the owners worked them on the floor of the showroom every half hour during the show Wilbert E. Foster, Wm. Hunter, Martin Smith and Olive Lofts filled the classes.

The squab breeding pens of Homers were not so strong this year as last, yet there were enough shown to make up a pretty class; one nice pen was that of C. M. Bates; they were pure white but not being quite as large, or even in size as a pen of Blue have had to take second place. This variety of pigeons always draws considerable attention on account of its commercial value and several good sales were made during the show.

The seamless band question was neglected last year and many birds were placed out of reach of ribbons on account of not being able to meet competition in the old class among fully developed birds. Every fancier should remember that a young bird hatched in 1906 must wear a 1906 seamless band that fits the bird, if it is to compete in the young bird class next show time.—W. E. Foster.

PIGEON FANCIERS FORM A CLUB.

The pigeon fanciers of Los Angeles have formed an association to be known as the Southwestern Pigeon Club. The officers elected for the ensuing year are as follows: W. H. Elliott, president; C. M. Bates, 1st vice president; F. G. McCoy, of Prescott, Arizona, 2nd vice-president; Wilbert E. Foster, secretary; Martin Smith, treasurer. Executive committee, W. H. Elliott, W. E. Foster, John Brenton, Geo. Kammers and F. G. Waltz. The club has fourteen members and expects to double that number in the next three months The purposes of the club are the improvement of all varieties of pigeons, also the holding of an annual exhibition either as an exclusive pigeon show or in conjunction with some poultry association. It will hold monthly meetings at which topics on pigeon culture will be discussed. Pigeon fanciers everywhere are invited to join.

STARTING THE CHICKS.

To get the chicks well started and keep them growing is not the easiest thing in the world. We find that the work is compensated, however, in the results that follow diligence. The whole summer's work is made up of the small details, which taken as a whole go to make success, and the poultry work that is made up without this part in it is generally quite costly. The work of getting the chicks hatched and started is too hard to let the vigilance lapse when the warm days of summer come. One of the most important parts of the warm weather work is the care that prevents crowding and sweating, thus starting colds which are sure to make trouble later. Too many chicks in one coop always sweat more or less. This causes colds, for as the chicks come out of their coops in the morning those in the middle of the bunch are sure to be warm, and then they catch cold in the same manner that a man does who gets too warm and then takes his coat off to cool down. These colds go from bad to worse and the night sweats continue, making them very offensive to the breath. Roup then sets in. This can only be prevented by keeping the chicks from crowding.

OFFICE OF

Must Hatch Incubator Co.

(INCORPORATED)
A. E. Bourke, Pres. Phone Black 1211

PETALUMA, CAL., JAN. 1, 1906.

TO WHOM IT MAY CONCERN;

As the chicken raising season is at hand, we beg leave to call your attention to a few of our specialties.

Do you need an Incubator? Our machines are fully guaranteed and have proven themselves unsurpassed wherever used.

Do you need Brooders? We manufacture just what you want; fully guaranteed, made of the finest material and of the best possible workmanship, and, above all, a practical machine which saves the purchaser money, time and labor.

Do you need Poultry Supplies of any kind? We manufacture a line of Supplies the use of which makes Poultry Raising not only profitable, but a pleasure. Among our specialties are:

Our Water Fountains; our Self Feeder for Chicks, our Feed Troughs, large and small; our Lamp Fillers.

Our convenient Must Hatch Nest Boxes ; our safe and sure Must Hatch Insecticide. our sanitery Must Hatch Disinfectant, our sure death Must Hatch Lice Exterminator, our Poultry Compound, a fine Spring and Fall Tonic.

In connection with the above list, all of our own manufacture, we can also furnish the following, which are indispensable to the Poultrymen:

The No. 128 Clover Cutter, the Enterprise Bone Mill, the Ohio Feed Cutter, the Banner Root Cutter, the Enterprise Feed Chopper, the Ideal Duplex Feed Mill, and the Farmer's Boiler.

Do you wish to make your own Incubator or Brooder? We can furnish you all the necessary parts for making an Incubator or Brooder, also plans for the best and most practical Poultry Houses.

Did you ever purchase Just Hatched Chicks? We have a Hatchery of 50,000 chicks per month capacity in operation the year round and have, for the past few years. been successfully shipping, in our specially constructed carriers, just hatched Chicks, to distances as great as 2,000 miles. If you need them, book your order early, as our future delivery list is rapidly filling up.

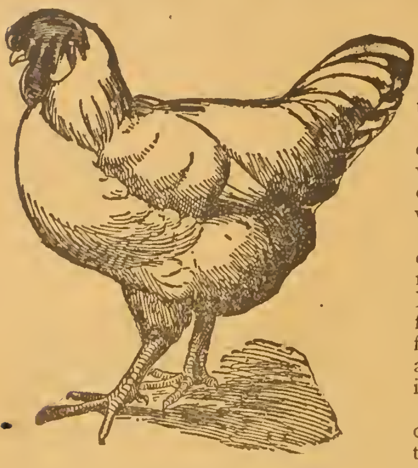
We can also supply White Leghorn hatching egg in quantities desired. If you have not already received our catalogue, write for Catalogue B, and you will find therein a more detailed description with prices, etc., of the above.

Hoping to hear from you in the near future, we are,

Yours Very Respectfully,

MUST HATCH INCUBATOR CO.

A Million Dollars For the Benefit of the Poultry Raiser



The Hen—consider what she does. Her own value is 50c and she lays an egg daily, valued at, say 2c. In one month's time she lays enough eggs to equal in value her own self.

The annual output of the gold mines of the Earth is small compared to the value of the Egg crop. The American hen produces annually more wealth than all our Wheat fields.

In taking up the Poultry Business, one should remember that "there is more profit in a small flock, WELL FED and cared for than in a large flock poorly fed." The idea that a flock of fowls will shift for themselves and return a profit to their owners, is a mistaken one.

They must be properly fed and cared for every day in the year if they are to prove profitable.

A. R. COULSON

To increase the profits of the Petaluma poultrymen by at least

$200,000 per Year

They need it. They deserve it—and if they WILL IT within themselves, they can EACH HAVE PART of it.

The rest of the poultrymen on the Pacific Coast may also have a share of the profits. This man's methods, if used by the poultrymen, would benefit the farmers and poultry raisers of California by one million dollars per year. It would increase the value of the Poultry Industry of the United States to over $600,000,000 a year.

$4 00 a Hen

How many laying hens have you got now? How many more can you get?

Suppose you could make those hens bring you in an income of $4.00 apiece this year? Could you make use of the money?

Make one strong, everlasting attempt to get out of the rut.

Make some money this year—make enough so you can BUY ALL the things YOU WANT, and still put quite a wad in the bank.

Make the money out of those hens of yours—don't lose hope. Science now comes to yaur assistance and you can make a hen lay

$4.00 Worth of Eggs

Strive to make each hen earn $3.00 a year profit for you.

How? JUST THIS WAY: Success lies within yourself. Are you willing to try?

Make up your mind and stick to it, that you are going to get all there is coming—that you will always see that the hens are kept supplied with clean, fresh drinking water, clean feed and water troughs, green feed, for the hens, warm, comfortable houses in winter, shade in summer, and FEED THEM once EVERY DAY without fail, a good square meal of COULSON'S IMPROVED MASH EGG FOOD, and a variety of other grains as needed. Coulson's Scratching Feed is also recommended to be fed once a day.

Spend a little more for the feed and make your hens lay twice as much.

You know that if you feed your hens this year the same as you did last year that your profits will not be any more, and that you will be just as poor one year from today as you are now, only one year nearer the grave.

To make your hens lay twice as many eggs this coming year, more than they did last year, you must feed better.

The COULSON IMPROVED MASH EGG FOOD will do the work. Use it and get rich.

$4.00 Per Hen

Coulson's Improved Mash Egg Food will only cost you 10c a bag more than the Regular Egg Food or about 10c per year per hen more to feed her, but the results in egg production will be increased by about $1 worth per each hen per year more. $4 Worth of Eggs from each hen per year. Try it.

Their 1st Birthday

Time, December. Since they were three months old they have been fed daily on Coulson's Mash Egg Food. These will be $4.00 Hens this year.

Are You a Knocker?

You know there is a certain class of men who think it necessary to knock every suggestion they hear advanced. It hurts them to suppose that man should be able to make suggestions to them. They are like the Irishman at a Donnybrook Fair, whowent around with a club in his hand, and every time he saw a head, hit it. Every time a suggestion is made to a man of this kind he will get his hammer and knock it on the head.

When Columbus sailed away from Europe people laughed at him, but when Columbus came back with his ships loaded with parrots and savages, proving that there was such a land, then everybody was eager to go to the new country and stake out a claim.

One Man Worth Millions to Iowa

Back in Iowa, a school teacher discovered a method of caring for and cultivating corn so that the yield would be increased nearly 100 per cent. So successful were his methods that Funk Bros., who had 20,000 acres of corn land under cultivation, agreed to hire him for one year to manage their place on good salary, to see what he could do. The result was that year they had an increase in their crop of over 100,000 bushels. The next year, 1904 this man traveled throughout the state of Iowa, teaching the farmers who were willing to learn, how to cultivate corn by a scientific method. That year, as a result, the corn crops of Iowa were thirty million dollars more than had been for any years before, and for ten years previous, the average yield was only 27 1-2 bushels to the acre. Now it is over 40 bushels to the acre. This shows what science can do.

Pick up the new ways—or you'll get left way behind. If in the poultry business, make each hen bring you in an income of $4.00 a year, by feeding **COULSON'S IMPROVED MASH EGG FOOD.**

Keep Up With the World

Fifty years ago you could only travel as fast as a horse could go and over rough roads. Now you can travel from one end of the country to the other between two Sundays. Think of the electric cars, or the sending of messages through the air! And don't forget about the new science of making a hen produce $4.00 worth of eggs in a year.

Don't Try to Get Along Without It

Nowadays it is not the things that we can get along without, but it's how far ahead we can get with the things that will help us to get there.

The Feed Free for One Year

There is no doubt about it. if you feed your laying hens Coulson's Improved Mash Egg Food every day for one entire year, that the hens WILL LAY so many MORE EGGS that the EXTRA EGGS will amount to enough to pay for the feed.

$4.00 a Hen

The average hen, according to statistics, lays only 66 eggs per year—many do not lay that many. A few poultrymen, by imitating as near as they can, a balanced ration, make their hens average 100 eggs per hen, and some as high as 110 eggs per hen per year. A number of poultrymen, last year, by feeding Coulson's Egg Food, averaged 180 eggs per hen per year.

One experienced poultryman, with 2,000 laying hens, fed Coulson's Egg Food the entire year, and the hens made an average of 184 eggs each. Taking the year through, the average price paid for market eggs last year was 28 cents a dozen. According to this, these 2,000 laying hens brought in an income of $8,000.00 OR $4,00 PER HEN.

What It Cost to Feed a Hen One Year

The cost of feeding Coulson's Improved Mash Food every day for one year, and also all the extra grain, Coulson's Scratching Food, etc., included, is $1.25 per hen.

So, if the hen produces $4.00 worth of eggs, they earn $2.75 per hen per year, average profit.

Egg Making Machines

Suppose you could find the substance that would strengthen and develop the egg-making organs of the hen, and at the same time supply the proper feed that could be easily digested and turned into eggs. The result will be that your hens will get to be regular egg-making machines.

That's what you want, isn't it? Thenfeed your hens one year on Coulson'sImproved Mash Egg Food, and make your little fortune. **SAMPLE FREE.** Ask your dealer about it or send for circular and free samples.

COULSON POULTRY AND STOCK FOOD CO., PETALUMA, CAL.

CALIFORNIA'S NEW INSECTARY

Continued from First Page

lished in the orchards and who could also stock infested orchards and groves without waiting for the grower to make application for them, which policy has been pursued in certain counties, and has made many new friends for the commission among the growers. Many cases of failure can be traced to a lack of correct knowledge of insect pests on the part of the grower who has applied for and received the wrong parasite, and wondered why the results obtained elsewhere have not followed his efforts. By the resident commissioner attending to the distribution of consignments it would insure their successful establishment.

In counties where the work of propagation is not understood, the commissioners should be instructed from the head office, and soon all the State would have a working force with beneficial insects that could not help but accomplish wonderful results. With this arrangement the difficulty of locating and gathering feed for the work of propagation could easily be overcome which is one of the greatest obstacles met with in the work at the present time, and through the medium of the Monthly Circular, issued to the Commissioners and Inspectors from the Sacramento office, we could all keep well informed upon the work in hand and by co-operating in this manner, the State generally would be greatly benefitted.

At the present time, we have over forty different predaceous Coccinellidae, Hymenopterous and Dipterous parasites that are awaiting occupancy of the new insectary, but I have only mentioned the recently imported ones, for a simple enumeration of the species, unless accompanied by a history of their respective work, would neither be interesting nor convincing, inasmuch as they have been tried and have proven what they are capable of doing under the proper conditions. As a single example of the value of their work, in that little room above mentioned there was reared from a start of three female flies, a horde of parasites that were turned loose on the Black Scale, and whose value, just two years after their introduction, Hon. Geo. C. Pardee, Governor of California, in his message to the legislature, placed at $2,000,000.

Many other countries are today following the example set by California and are fighting their insect pests by use of the natural enemies, and in some cases, have exceeded us by erecting commodious insectaries that are proving excellent investments.

If we contrast the present proposed conditions with the less unfavorable ones of the past, we may get something of a view of what the future, no doubt, holds out to us. This view leads us to the conclusion that it is then true economy to surround our predacious and parasitic insects with every possible facility for broadening the work so well begun, where, under such salubrious conditions as are offered in the establishment of the proposed insectary, as a functional benefit, my courage fails me to place an estimate on the possibilities of the future.

COWPEAS

Continued from page 100

will make perhaps as much growth as when sown in May. The bush varieties ripen in 60 to 90 days from time of planting. The long trailing kinds require much longer time, six to nine months.

When planting in drills, about 15 pounds of seed per acre is enough but twice that amount is required when sown broadcast. These amounts are not the same as those given in the books written for eastern growers, but experience during the last two years in the south, has demonstrated the fact that the cow pea makes a better growth if given plenty of room when young.

VALUE OF FERTILIZERS.

Editor Cultivator: Will you please tell me through your paper the respective commercial values per pound of nitrogen, phosphoric acid and potash, California prices.—Citrus.

Nitrogen in California is usually worth 16 cents per pound but the recent war in the east raised this price a fraction of a cent and it will cost a little more than 16 cents for a while. Nitrogen is used in the manufacture of gunpowder and is always higher in price when some great war is in progress. Phosphoric acid is worth 8 cents a pound in the available form and 2 cents in the insoluble form. Actual potash is worth about 6 cents per pound.

FRESH FRUITS FOR SAN DIEGO

Editor Cultivator: Wishing to plant a few acres of peaches and pears with the object of marketing them in San Diego in the fresh state, I would like your advice as to what varieties to plant. There was no curl leaf in 1905 but in 1904 I lost all my late Crawford crop from it. I intend to plant the following varieties of peaches: Early Crawford, Newhall, Elberta, Susquehanna, Picquets' Late and Lovell, picked them out of the catalogue; have not tried any them here yet.

I cannot see any quotations for fresh pears in the papers. Can you give me any reason for that? You one time spoke so highly of Duchess De Angouleme, what is its record now? What do you think of Barry and Winter Nelis? My elevation is 1500 feet and have been exempt from blight? Are the foothills as a rule exempt from blight? Winter Nelis and Flemish beauty had a big crop this year but Bartlett was very light.—A. K.

Newhall, Susquehanna and Picquets Late peaches never bore well at the Pomona station. In fact they were considered failures with us.

The reason why the quotation for fresh pears in the local market has been omitted, may be laid to the blight to a large extent. The chief pear districts of the state are in the north and the canneries used up almost the entire product the past season.

Duchess De Angouleme started out well with us but proved a failure after the start; one died suddenly from top to bottom with the blight and the remaining one never bore fruit enough to pay for the pruning.

Patrick Barry is a good pear and bore well with us. If you are now free from the blight and have tested Bartlett, Winter Nelis and Flemish Beauty and find they do well, they are good varieties to tie to.

Bartlett is liable to be a blight bearer some seasons.

Early Crawford, Elberta, Lovell and Salway are safe peaches for you to plant.

No location is exempt from the blight. It is a bacterial disease and will invade any orchard which once has an infected tree unless the disease is eradicated at once.

ASPARAGUS.

Editor Cultivator: Will you kindly inform me through the columns of your paper, what is the best time to plant asparagus seed and how to plant it? I have some seed from a few bushes about two years old.

Do you think that sandy loam like ours would raise good celery?—Mrs. H., Imperial Valley.

Asparagus seed may be planted now, as soon as the soil warms up a little. The seeds are very easy to start and in your section would need no special treatment. Cover about one and a half inches and keep well watered. If the soil is warm the seeds will sprout readily, especially if they be soaked in warm water for 24 hours previous to sowing. We do not think your climatic conditions good for celery growing even though soil was suitable.

MELON APHIS.

Editor Cultivator: Dear sir, last year I was troubled a great deal with a very small fly of light green color; it damaged my watermelon vines and tomatoes and squash; they seemed to suck the juice or sap until they would turn pale and die. They were very numerous and kept up their destructive work till late in the season. If you or any of your correspondents can tell me how to to control the pest, I shall be very much obliged. I remain, yours—J. M., Pleyto.

The only effective control of this pest is gained by fumigation with carbon bi-sulphide. Take two common barrel hoops, leaving one whole, cutting the other in half; cross the halves and fasten to whole hoop to form a frame work of a hemisphere. Cover with good strong paper. If vines are larger than this cap, gather up in a heap, put a saucer on top and pour in your liquid; put cap on quickly press down firmly and pull soil around the edges. You should have a number of such caps.

PLANTING NEAR PARTY LINE.

Editor Cultivator: Is there any law in California regulating the distance of planting trees and fruit trees, berries, etc., on or near boundary lines. If there is you will confer a favor by publishing it in the Cultivator and oblige a subscriber.—C. B.

You may plant as near the line as you wish. Fruit from your trees overhanging your neighbor's property belongs to him. If the other way about all fruit growing on your premises is yours, without regard to location of roots.

INOCULATION WANTED.

Editor Cultivator: I have alfalfa planted in young orange orchard. No nodules are on the roots, what can I do?—W. H. O., Covina.

Write to a seed firm for bacteria for alfalfa or go to a field that has nodules on roots and get a small quantity of the soil and scatter in your field or put soil in water and pour water on field.

JOHNSON GRASS.

Editor Cultivator: Please tell me in your next edition where I can get the true Johnson Grass seed. I want to sow an acre just for cow pasture on light soil to see if it produces more feed than our native grass.—J. D., Sonoma County.

As we consider Johnson Grass a serious pest, we would not advise its planting and cannot therefore tell you where to procure the seed. There is a law against planting it.

WALNUTS AND PEARS.

Editor Cultivator: As I am contemplating planting out several acres to walnuts, I would like your advice as to the varieties which would be the most profitable. Of course I would like a regular and heavy bearer. I prefer to plant the nuts where I want them to grow. Will the Santa Barbara soft shell reproduce itself and are they heavy bearers? I would like the best winter pear. Please give me the desired information. I have heard the winter Bartlett highly recommended; please tell me what you know of it and where I can obtain same. Kindly answer at your earliest convenience in the Cultivator.—A Subscriber.

The Santa Barbara soft shell walnut does not produce large crops in the northern part of the State and would not likely be profitable for you to plant. Any of the French varieties will be better as your conditions are more nearly suited to them.

We think it will be best to get your trees from a nursery as you are more likely to get an even stand of trees than by planting the nuts and do not have the trouble of caring for the small trees. You should by all means make the selection of trees yourself and get only the strong bodies and good root systems. Grafted or budded trees will give the best satisfaction when they get to bearing.

The winter Bartlett pear is highly recommended but we advise you to see what some of your successful pear growers are planting and do likewise.

Clubman—It's astonishing how many fools there are in the world!

Philosopher—Yes, and there's always one more than we think.—Translated for the Tales from Simplicimus.

"Sheds water like a duck's back"

An ideal roofing must be absolutely water-proof, practically fire-proof and alway weather-proof.

Rubber Sanded Roofing

Is proof against everything an ideal roofing should be proof against. Water flows off of it as fast as it falls. It is practically a fire-proof roofing—cinders, sparks or blazing brands falling upon it will burn themselves out, without injury to the roof. It is weather-proof in every climate. A building is warmer in winter and cooler in summer, than under any other class of roofing, because it is a non-conductor. Be sure to investigate thoroughly, that

Wear=Proof Surface of C'ean Flint Sand.

"Pioneer" Rubber Sanded Roofing is put up in rolls —ready to lay and is easy to put on. A complete kit of roofing supplies is furnished with each roll. Our Booklet "D" will tell you all about the roofing question. Send for it today.

Pioneer Roll Paper Co., Los Angeles, Cal.

Household Department

A LITTLE DUTCH GARDEN.

I passed by a garden, a little Dutch garden,
Where useful and pretty things grew—
Heartsease and tomatoes, and pinks and potatoes,
And lilies and onions and rue.

I saw in that garden, that little Dutch garden,
A chubby Dutch man with a spade.
And a rosy Dutch frau with a shoe like a scow,
And a flaxen-haired little Dutch maid.

There grew in that garden, that little Dutch garden,
Blue flag flowers, lovely and tall,
And early blush roses, and little pink posies,
But Gretchen was fairer than all.

My heart's in that garden, that little Dutch garden,
It tumbled right in as I passed,
'Mid 'wildering mazes of spinach and daisies,
And Gretchen is holding it fast.
—Hattie Whitney.

FOR THE BRIDE—TO BE.

Lucy Haven Johnson writing in the the Farm and Home gives some homely hints to young ladies who are about to become wives and housekeepers. She writes of the things any girl can make which will prove useful as well as ornamental in the home. These are some of the pretty things she tells about which would certainly add comfort to any home:

A cover for the sideboard can be made of linen crash, which costs about twelve and a half cents a yard; cut it long enough so that the ends will hang over for about a quarter of a yard; fringe the ends, knot the fringe and hemstitch the edges. Then put two rows of drawn work above the fringe, or a simple vine worked in outline stitch across each end. Large disks and crescents outlined with heavy white silk floss are pretty scattered over the whole cloth. Mine has a two-inch border entirely around it, cross-stitched with six shades of wash silk in Oriental colors. The edge is finished with crocheted linen lace two inches and a half wide. It is very satisfactory and I really enjoyed working it, but it might seem a good deal of work to a new beginner. Two or three simple scarfs will not cost so much as one handsome one and a housekeeper will be able by having several to keep the sideboard looking nice and clean all the time.

Doileys are so convenient to keep the new furniture from mars. Bits of linen, lawn, crash, white brilliantine, silk or velvet, cut round or oval and buttonholed around the edge may be used for the center with a crocheted border.

A footstool may be made of, a wooden jelly pail with, a larger round board nailed to the top; pad on top with cotton and cover with flannel or velveteen as near the color of pail as possible. Around the edges nail with gimp tacks scallops cut from shoe leather. If jelly pails do not flourish in your vicinity buy four large harness hooks and screw them to a thick rectangular plank for a foundation. for your stool; lengths of old fork handles, fitted, glued and firmly nailed into holes bored in the top will do for legs. If there does not happen to be any paint, stain or varnish on hand, tube paint can be used to paint the legs. If there is a "handy man" around get him to make you one of the plain new "mission stools."

There are many things that it wouldn't be practicable to either buy or make until one is really living in the new home; but here lies the secret of all furnishing, have all colors correspond. No amount of money can give a pleasing effect where they do not, and the most home-made room is restful and homelike if the colors harmonize.

Nearly every girl of marriagable age possesses a few artistics pictures Have these suitably framed, with wire and screw eyes attached ready to hang upon the walls. Pictures take away that cold, bare, new look, sometimes noticeable in very new homes. Perhaps "mother" or "auntie" will have some articles that they can spare to help "our girl" out, for it is not always the new things that are the nicest. A cracked stone churn painted dark red or dull blue and ornamented with crackle work, with here and there extra dots and dashes of gilt bronze or bronze-green paint, will make a nice floor vase. It can stand in the hall with a Japanese plate for cards upon the top or in the living room, holding a great bunch of bitter sweet berries or red rose tips. A small paper sack should be filled with pebbles and set inside so that the vase will not tip over. A glass mustard pot, about seven inches high with a cover, may be filled with cornelians or agates covered with water, and makes a pretty little ornament. A tall, narrow half-gallon butter crock, a snuff jar or cracked pitcher may be painted like the floor vase to hold a nice growing plant.

A cover for a small table may be made of a square of velveteen or worsted cloth, bordered with a stripe of bright Oriental cretonne, or trimmed with tiny silkateen tassels made over a three-tined fork. It should be lined with cambric.

Very nice home-made rugs may be drawn upon burlap with a coarse crotchet hook, making a pattern in rows of half diamonds in red, yellow and black upon a gra-- foundation in imitation of a Navejo blanket. Finish the ends with fringe. Make this rug of all wool rags and use all the scraps of cotton in a hit or miss rug.

A young unmarried man with a moderate salary is not apt to save a great deal of it, but if he marries there is perhaps more necessity of economy and if his wife is a true helpmate they will find much pleasure in making a home together (cistern and woodshed included), which they would have missed otherwise. No sensible girl expects her husband to begin life where her father left off, and if she is not willing to help "feather" her new nest she would better remain with her parents for she would not make a "first-class" wife for any man.

A method of gathering on the sewing machine, which may be used on any material, and can be employed where the ruffler cannot is to loosen the tension of the upper thread until it is very loose, having the thread on the bobbin strong. Stitch across the material to be gathered, take from the machine and draw up the lower thread to the required length. This plan is much more satisfactory than the use of a ruffler, as one cannot always guage the ruffler to the required length.

Tools for The Farm

Keen Kutter quality tells in the actual use of the tool. Keen Kutter Tools are not retired by an occasional snag or "tough proposition." They are made to stand hard work and lots of it. They hold their edges, do not break easily, and last long after poor tools have gone to the scrap heap. The

KEEN KUTTER

brand covers a complete line of tools. In buying any kind of tool just see that the name Keen Kutter is on it and you have assurance of full satisfaction. Keen Kutter Tools have been Standard of America for 36 years, were awarded the Grand Prize at the St. Louis Fair, and are the best that brains, money, and skill can produce.

Some of the kinds of Keen Kutter Tools are: Axes, Adzes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Tool Cabinets, Scythes, Hay Knives, Grass Hooks, Brush Hooks, Corn Knives, Eye Hoes, Trowels, Pruning Shears, Tinners' Snips, Scissors, Shears, Hair Clippers, Horse Shears, Razors, etc., and Knives of all kinds.

E.C. SIMMONS KEEN KUTTER TRADE ST. LOUIS MO. MARK

SOUTHERN PACIFIC

COLONIST RATES TO CALIFORNIA

Santa Fe

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leovenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearlo all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist leeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

Cookery Recipes

ONION LUXURIES.

Onions and Cheese.

Take some large Spanish onions, skin them and boil them until they are quite soft. Drain and rub them through a sieve. Put the pulp in a baking dish and add butter, pepper and salt and a little stock or milk. Grate cheese over the surface and place in the oven until brown.

* * *

Onion Glaces.

Pour a third of a teacup of olive oil into a frying pan. When hot add six or eight good-sized sliced onions. Cook slowly until they are lightly browned, skim them out and put in a saucepan. Rub a heaping teaspoonful of flour into the oil, and add a half pint or a little more of soup stock. Season with salt, pepper and a little nutmeg. When this has boiled pour it on the onions and add a little celery chopped fine. Cover and simmer until done. Serve with hamburg or broiled steak.

* * *

To use up odds and ends of pastry make a lining in some small party tins and fill with two yolks of eggs whipped stiff and mixed with two tablespoonfuls of grated cheese. Beat the whites stiff and fold lightly through it just before setting in the oven, and bake stiff.

* * *

A goose having short legs, is trussed differently from chicken, fowl and turkey. After inserting skewers wind string twice around one leg bone, then around the other leg bone, leaving one inch space of string between the legs. Draw legs with both ends of string close to back, cross string under back then fasten around skewers, and tie in a knot.

* * *

Either cold or hot slaw is especially nice served on the same platter with fried oysters as a luncheon dish. Heap the slaw in the middle of the platter and serve the oysters around it. If cold slaw is used warm the platter without getting it too hot, lay a folded napkin in the center of it, and heap the slaw on the folded napkin.

* * *

Fillings for school lunch sandwiches which take the place of meat can be made from mixed fruit and nuts. Wash, stone and seed equal weights of figs, raisins and dates, and put them through a meat chopper with half the weight mixed and prepared nuts. Feed the chopper, alternating the fruit and the nuts, a little at a time until they are all chopped and mixed. Pack it down tight in baking powder cans, and when molded slice off thin slices and put between bread and butter.

HE WAS A BALL PLAYER.

Dan—"I wonder if the Koh-i-noor is still the biggest diamond there is?'"

Fan—"I dunno where that place Kohinoor is, but if th' diamon's any more'n ninety feet each way it ain't regulation an' oughtn't to be recognized."—The Pilgrim.

FORCED ENJOYMENT.

Tired Mother (to restless child): "Now you set still! I've druv you ten miles to enjoy this entertainment, and you shall enjoy it, if I have to pull every hair out of your head!"—The Pilgrim.

THE FAMILY DOCTOR.

Eating Wrong.—A physician of more than 20 years practice says there is greater ignorance among the people on the question of how to eat than on any other known subject. Not one person in one hundred eats according to nature's rules. He eats too fast; he eats too much; he eats the wrong kind of things, anyone of which will bring on dyspepsia and result in chronic stomach trouble of one sort or another. Children are made to bear burdens which would ruin animals of the same age. Think of feeding a year old babe pickles and doughnuts and yet that is what lots of mothers do without thinking what consequences of such diet will entail. The truth is half the people in the country don't know enough to raise babies so they will have stomachs in after life.

There are certain rules in regard to diet which all who have weak digestion need remember: Eat slowly; masticate the food thoroughly. The more time the food spends in the mouth proportionately, the less time it will spend in the stomach; avoid drinking at meals, as far as possible: food should be neither too cold nor too hot; eat no more than the system requires. Strength depends not on what is eaten but on what is digested.

Those who work hard do not always need a large amount of flesh food. They do need a liberal amount of albuminous food to supply the waste of the tissues, and this is found in larger quantities in peas and beans than in the best beefsteak.

Oat meal and wheat meal are also rich in tissue making elements.

* * *

Neuralgia.—Neuralgia is said to be "the cry of the nerves for food." By food is meant good blood, from which the nerves can draw nourishment and strength and become fortified to resist disease. Good blood may be had by right living—fresh air, good food, refreshing sleep, hygienic surroundings and work that does not tax the system too severely: Where a sensitive nervous organization and a weakened vitality are predisposing factors, these are cardinal points to keep in mind.

* * *

Cold Water Cure.—A celebrated physician once remarked that water used in various ways, internally and externally met with more requirements in healing disease than any other known remedy. We therefore hail with pleasure a "cold water cure" which is one of the good things that comes from the Russians. It is said that when a Russian woman is tired and her nerves are "on edge," she dashes cold water on her face or binds ice on her forehead. In the winter she wraps up and faces a blinding snow storm for a little while. So successful has she been with this heroic treatment that her English sisters are adopting the cure for more than weary nerves.

After a nervous strain, tired muscles—the head, arms, and feet are treated to the same remedy, a dash of cold water in some cases with marked relief.

CHEER UP!

Cheer up, honey,
  Doan' yo' cry;
Good times comin',
  By an' by.
From your brow that frown now
    banish,
Fah de clouds are suah to vanish,
  By an' by, by an' by.
—Leigh I. Maynard.

HOW MUCH THE HEALTH BOARD KNEW.

Some time ago the state board of health sent little wooden boxes to various towns in the state, with instructions to physicians that whenever any symptoms of diphtheria or other throat trouble appeared to have the patient deposit some sputum in the box and mail it to the state board for examination. Recently Abilene had a diphtheria scare and the state board of health heard of it, says the Kansas City Journal. A bright young physician there, who didn't take much stock in the sputum business, thought he would give it a test. He hunted up a young man who had never been sick in his life, whose lungs were as strong as a blacksmith's and whose throat was as clear as a tin whistle, and had him spit in the box. He sent it to the state board of health, with a request that it be examined at once and results wired him. The next day he got this word from the board of health; "Diphtheria dangerous; quarantine at once."

HAVE YOU LEARNED?

The value of sunshine?

To change a house into a home?

To think and judge without prejudice?

To look up, then reach up and grasp the best?

That some uncomfortable words may be overcome.

How much environment has to do with what you are?

What a little thing will sometimes make a child happy?

That an outside door or even the glass in it may tell secrets?

That there are two kinds of wealth, and that one is of the heart and mind?

That the paper and pictures on the walls, the carpets and curtains may affect the mood of a sensitive person?

That a tidy is out of place when it becomes more important than the object which it is supposed to protect?

From experience, that discouragements are to be found on all sides, but that encouragements are dealt out sparingly by prudent hands?—Good Housekeeping.

AN ECONOMICAL WATER-LIFTER.

The business of lifting water in California has had such a wonderful growth that it is hard to keep up with the latest improvements which progressive manufacturers are offering to irrigators. Among these progressive people the Pomona Manufacturing Company stands in the forefront with a most practical and ingenious inventor at the head of the concern new "Heads" and improved valves and cylinders have been brought forth until it seems as if the limit of economy had been reached. The Pomona people are today putting out a head which is exceptionally satisfactory, in that it has a continuous lifter with no "water hammer" and other application of power to the rods which gives sufficient use of the power employed.

These cylinders are made of the best brass tubeing and the valves are of the most approved pattern. These deep well features are fully as important as the mechanism of the head, or even more so for the reason that they are the most difficult to repair They are cast and finished completely at the shops of the company.

A card to the Pomona Manufacturing Company, Pomona California, will bring illustrated matter descriptive of these pumps which will give an idea of their construction.

"THE STRAWBERRY."

Right from the headquarters of "Kellogg's Pedigreed Strawberry Plants" at Three Rivers, Mich., comes a bright, well printed, finely illustrated monthly periodical entitled as above and devoted to the subject exclusively; price $1.00 per year.

An inquiry was made recently where asparagus roots could be had. In this issue W. M. Avis of Pomona advertises some first-class roots, three years old and just right for planting.

Golden Laced Wyandottes, Blue Ribbon Winners are advertised by J. English, of Arroyo Grande.

Mrs. Albert Miller of Los Angeles advertises Buff Orphingtons and Barred Plymouth Rocks.

R. S. Cox of San Marcos, Cal., is advertising White Plymouth Rock cockerels.

R. B. Brubaker, of Shandon, Cal., is advertising Brown Leghorn hens.

George W. Peck of San Diego, Cal., is advertising Seedless Blackberries in this issue.

White Leghorn eggs in Incubator lots are advertised in this issue by the Avenue Poultry Yards, Ventura, Cal.

The finest of Brandywine Strawberry plants are being advertised by the Barbour Ranch of San Gabriel.

The Reality Trust Company of Los Angeles is advertising poultry ranches in the Cultivator of this week.

Those wanting Black Minorcas will be interested in noticing George R. Alber's advertisement in this issue.

Grape cuttings of all varities are advertised in this issue by Peet Bros., of La Canyada, Cal.

J. A. Baker, of Glendora, Cal., is advertising orange seed bed stock on another page of this week's issue.

C. E. Davis, of Redlands, Cal., is advertising his fine Rhode Island Reds in this issue.

T. S. Ingham, Highlands, Cal., advertises grape vines in this issue.

W. M. Gray, of Gardena, Cal., calls attention to an exceptional opportunity for fine homes and residences in that section in this issue.

We are in receipt of the 1906 catalogue of Peter Henderson & Co., the largest and most ornate this well known firm has ever issued.

Cracked Corn	1.50
Oil Cake Meal	2.10
Cocoanut Meal	1.55

TWIN INDUSTRIES.

The greatest opportunity exists for special development of the poultry and dairy industries in California, says a recent bulletin of the California Promotion Committee. It is urged upon the farming people of the State to look into these industries for the profit to be obtained therefrom. California is spending millions of dollars every year for poultry and eggs and Eastern States are reaping the benefit from the laxity of California's citizens. In the past twelve months more than $3,000,000 were sent East for eggs alone, while the money expended in the Middle West for chickens and turkeys to supply the California market probably exceeded that spent for eggs. California is especially adapted for poultry raising in all parts of the State, and as an adjunct to the income from farms of all kinds and especialy fruit farms there is nothing that brings more ready money than chickens. It takes little capital to start when the farm is already going, and the profits are certain and constant. Hundreds of people who are now living on small farms of ten acres or less could make a good living if they would turn their attention to the raising of poultry.

What is true of poultry is also true of dairying. The prevailing prices of milk and butter in California are such that any man who goes into the business, even on a small scale, can make good profit. California's climate is especially a dairying climate. The cattle can spend 365 days in the year out of doors, and the feed is better than is to be found anywhere else in the world. The demand for California butter during the winter months when everything is green is California is so great that it cannot be supplied, and New York alone would take all that could be produced.

San Francisco Markets.

San Francisco, Jan. 31, 1906.

Butter.

Butter is firmer and prices for extras and firsts were advanced a fraction, supplies cleaning up well at the hardened prices. Trading on Change was quite extensive and a good buying interest was displayed throughout the open market. Cheese was firm at the appearing prices.

Foreign Lemon Sale.

NEW YORK, Jan. 30.—Seven thousand boxes of Sicily lemons were offered at auction today. The cargo is in good condition. The market is 25 cents higher. The next sale will be held on Friday, when 7000 boxes will be offered. Prices realized today were as follows:

Fancy 300s, $2.35 to $2.60.
Choice 300s, $2.20 to $2.35.
Fancy 360s, $2.35 to $2.55.
Choice 360s, $2.20 to $2.35.

One of the finest exhibits of fresh fruits at the Chamber of Commerce Rooms is made by the little town of Escondido in San Diego County. This thriving little community last season paid off its water bonds and besides a fine irrigation system all having been paid for, has $50,000 in school buildings, and no school debts, in fact, the community has no public debt of any nature and is now trying to induce the homeseekers their way by exhibiting what they can grow, and in this effort they are making a great success.

Climate and Crops

U. S. Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, Jan. 29.

General Summary:—The weather was clear and warm in nearly all parts of the State, with unusually high temperatures in the valleys and in Southern California at the close of the week. Light showers fell in the central and northern sections early in the week and heavy fogs prevailed in the coast districts at the close. Early grain and grass were greatly benefitted by the warm weather following the heavy rains of the preceding week and growth was rapid. Grain is in very good condition in most places and gives promise of an excellent crop. The damage done to grain fields by recent heavy rains and high water was not serious except in a few places. Plowing and seeding have been resumed and the grain acreage in some sections is being increased. Sugar beet planting has commenced in the San Joaquin valley. Green feed is becoming plentiful in nearly all sections and stock are rapidly improving. Except in Southern California the season is somewhat backward and the rainfall deficient, but the crop prospects are considered very good.

Orchards and vineyards are in excellent condition in all parts of the State and pruning and cultivation are progressing rapidly. The damage by frosts this season has been comparatively light and the outlook is good for large crops of deciduous fruits and grapes. Citrus fruit trees have been greatly benefitted by the recent warm weather. Orange harvest continues in Southern California and shipments are going forward daily.

Eureka Summary.—Weather conditions have been very severe on cattle and many have died from lack of feed, but the past week was more favorable. Grass and grain are making slow growth and stock are improving.

Los Angeles Summary.—Warm, growing weather following the rain, materially improved crops and vegetation of all descriptions. Grain and grass are doing well, with indications of a prosperous season. Almonds are blooming. Oranges are moving freely in some sections and shipments have just been resumed in others.

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

INDIGESTION.

Editor Cultivator: I have a young heifer that is very loose in the bowels and has been so for a long time; have tried burned flour, laudanum and flaxseed, but she gets no better; can you give me a remedy and oblige.—R. A., Santa Ana.

This is a case of indigestion; you don't state the age of the heifer. Give if two years old 1 1-2 pints of raw linseed oil; 2 ounces turpentine; 1 1-2 ounces laudanum. If older give 2 pints oil and 3 ounces turpentine.

* * *

Editor Cultivator: Will you please ansewer through Cultivator this question? Will a splint cause a horse to go lame? I have a young horse three and a half years old, which has a small splint on one front leg about two inches above the knee joint on the inside of the leg. He shows some signs of lameness. Can I effect a permanent cure by blistering?—P. C. B., Covina.

Splints very often cause lameness; nearly always do if located on back of common or small splint bone.

Blistering will often stop lameness if splint is continually growing it should be pin fired and then blistered.—Dr. Oliver.

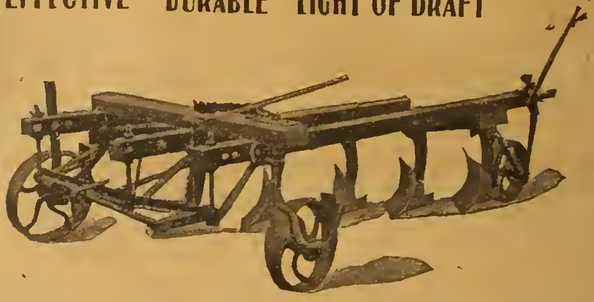
Stockton Reversible Gang Plow

EFFECTIVE DURABLE LIGHT OF DRAFT



This is our regular Plow and Land Shifter and Rear Lever. Land Shifter simple and durable. It is in easy reach of operator and there is no danger of wheel running over foot.

Houser & Haines Mfg. Co.
Stockton, Cal.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pumphead using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

MIDWINTER SCENES IN SAN JOAQUIN COUNTY.

San Joaquin County is in the very heart of Central California and commands the entrance to a valley containing 20,800,000 acres, 10,000,000 acres of which is good agricultural land, capable of supporting, with its cities and towns, a population of two and one-half millions. At the present time this district contains only about 200,000 people.

Malthoid Roofing
can be put on by any farmer. You don't need to hire a carpenter; the only tools needed are a hammer and a knife.

It is easier to put on than laying a carpet

It can be used on any kind of a building—a hen coop or the biggest barn—no difference whether the roof is flat or steep, you will have a water-tight roof that will last for years. Blizzards won't touch it—the blistering heat of August won't make it spring a leak—once on, it's good for years.

MALTHOID ROOFING is made by the same company which originated P & B Ready Roofing 22 years ago—the Pioneer Roofing. Sold by agents and dealers everywhere. The Portland Exposition Buildings were covered with MALTHOID. We will send you **a handsome book of views of the Portland Exposition** and a sample of MALTHOID free if you mention this paper.

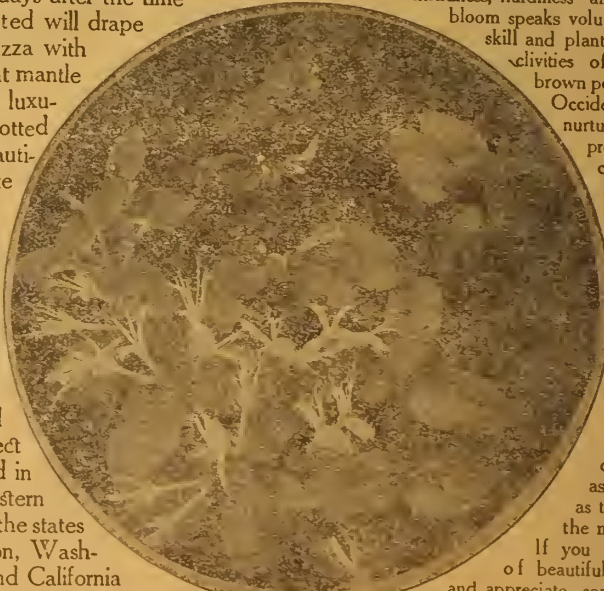
JAPANESE HONEYSUCKLE

This Floral Wonder is the Latest Importation from the Land of the Mikado



Is a sturdy rapid climber and within sixty days after the time it is planted will drape your piazza with a brilliant mantle of green luxuriantly spotted with beautiful white flowers turning to yellow. It blooms constantly—is never bothered with insect pests and in the Western parts of the states of Oregon, Washington and California holds its foliage throughout the entire winter season.

The plant is a genuine floral wonder. Its thriftiness, hardiness and prodigal bloom speaks volumes for the skill and plant-loving proclivities of the little brown people of the Occident who've nurtured and improved this climber for so many years. We have imported a large number of these parent vines from Japan. They take root on this coast as readily as they do in the native clime. If you are fond of beautiful climbers and appreciate something in plants decidedly bizarre and out of the ordinary, try some Japanese Honeysuckle on your porches and fences. You'll be charmed to see how beautiful this plant will make an ugly old fence or shed apppear.

IVY COLLECTION—No garden is complete without Ivy. We have a fine stock of healthy roots. The old favorites Boston Ivy—English Ivy—Kenilworth Ivy—and Variegated Ivy are 25c. per poot or the set of four for 50c.

CLIMBER COLLECTION—We will send you this whole collection of seven climber roots postpaid for $1.00 Japanese Honeysuckle—Kenilworth Ivy—English Ivy—Trumpet Creeper—Japanese Hop—Virginia Creeper—Boston Ivy.

Our shipments are all packed with extreme care. All roots are imbedded in moss and will travel ten miles or ten thousand miles with absolute safety. They will arrive in perfect condition; are ready for immediate planting.

California Vegetable Market Gardening

By O. M. Johnson.

Market gardening in California is being done by the Orientals to the extent that many ambitious Americans have lost heart. And the idea prevails among many of our people that the Chinaman is the best gardener we have. This is altogether wrong. A wrong idea as well as a wrong condition. The Chinaman is ever at it. And with his bare feet he will mulch the soil over the seed bed, and will crawl along between the rows, pulling weeds, digging around the plant. and cultivating and nurturing the plant in ways not persisted in by our own people. He will irrigate, and re-irrigate, often without cultivating until the soil is as hard as a brick. Anything to get a growth, regardless of his treatment of the soil. He is ever at it, and in the sense of getting a growth we might say that he is successful. He will kill the land in one year and for the second year he will say the land is "no good" and want the rent reduced. His income from one acre during a season may be to him "heap good" and to an ambitious American be so small that he can have a mere existence. This, we do not consider good gardening. A good gardener can cultivate the same land year after year without damage, and in many cases the land will improve under cultivation.

The Japanese boys are in the garden industry as they are in international affairs. They are hard to deal with until they have "shown their hands" and we will not attempt it at this writing. But in one thing he is like the Chinaman. He will crowd everything into his market produce that has a semblance of that article, And thereby injures the market. The market is at times bad enough, and we are guilty of helping to make it so, as I shall try to show.

Market gardening has a great future in California. Especially is this so within a radius of twenty miles from the market centers in our large cities. At this time it takes an immense amount to keep our cities supplied with the toothsome garden products. And besides the west has such vast territory where gardens do not thrive and the people in these places are our victims. Until recently the eastern cities did not look to us for winter vegetables. This demand is rapidly increasing and is correspondingly improving winter vegetable values. Conditions are shaping themselves so that these little well watered, fertile spots of our are to be the lands of "milk and honey."

Aside from a pecuniary feature gardening is a pleasure. This may not be so to every one. But he who finds no pleasure in it, he who can not see beauty in a well finished garden product, he who takes as drudgery the work necessary to grow it, had best hunt for some other business. Is a row of rose bushes more beautiful than a row of cabbage? Is a rose more fragrant than a cabbage? We think not when the dinner pot is on. A successful gardener must be methodical, careful and painstaking. Then his market garden will be as beautiful as the flower garden, and he will find pleasure in it.

It is presumed that every one engaged in market gardening is in it for financial results, and we are called upon to deal with the subject as will meet present conditions. We shall therefore direct our remarks to that end and as we understand the subject.

Our transportation facilities are so good that we can ship in large quantities, in competition with many other sections and have a profit over them after meeting them in the market at the same price. Our very rich soil and abundant water supply enables us to produce in large quantities, at a less cost, as compared with many other localities, and again meet them on the market at the same price and have a profit over them. Then it is evident that our strong point is in growing and marketing in large amounts, not regardless of quality, however, but that will be mentioned later on in this paper.

New York Purple Egg Plant.

The winter season affords the best market for vegetables and we can not produce locally some of the extremely high priced delicate articles that are successfully grown at southern foothill points where the winter sun is for weeks at a time almost as warm as our summer sun. We can grow the plants, but proper fruiting is hard to obtain in this cool climate.

Then we must grow soemthing that will thrive in a cool climate, or something that does not require fruitage. And that selection must he made by you. Select according to your own taste and knowledge. Any one can grow some kinds of vegetables at some time of the year, and practically all do so. Even the office man and the professional man in the city on a lot 40x120 feet tries to grow his favorite dish. And usually such things are easily grown at the time he attempts it. All this lessens the demand and cheapens the article. The gardener should not be discouraged at this. For when the hot summer days come his peas will dry up and quit fruiting. Or he gives his tomato vines so much water that they will not fruit at all, and something is happening to the novice all along the line. And here is where the professional gardener gets in his work. There is hardly a time in the entire year that some produce well adapted to our conditions will not command a fair price. We should look to this and plant accordingly. And this brings us to our principal point. We must concentrate our efforts and be specialists. As we now do, we are too much of a common herd. We try to produce all kinds of vegetables and attain proficiency in none of them. Too many of us do not understand the production of the thing attempted nor the time of planting and marketing the same for the best financial returns. It is impossible for one man to master the entire list as to production and marketing. The gardener should select his line, learn to produce an excellent, well finished article or he had better not produce at all. It is a waste of energy. This is an age of specialists and applies to this branch of industry as it does to others. We must be specialists if we would win.

An excellent product is easily marketed while a poor one finds no market at all. Of this we speak advisedly. One must know his soil, climatic conditions necessary to produce an article, when and how to plant, as well as cultivation and irrigation best suited to its development. Time here refers to that period when the probable market conditions will justify the expense of labor necessary to produce it, then produce the best there is to be had.

Knowledge and practical experience will produce the superior article and a reputation for that knowledge and experience together with honesty and decency in preparing the product for market. This reputation is attained by constant care and painstaking. By constantly keeping the same article before the market people at the proper season. No doubt many of us have at times a good product returned on our weekly sheet as lost, while some gardener was on the market getting a good return for his labor. There are certain men near Los Angeles who are depended upon to supply a market with a certain article. These men get the top price and we take what is left. It matters not whether you are marketing by consignment or direct sale. The result is the same. If you have a reputation for some particular line the market people will hunt you up. The jobber, the commission man, the retailer and the consumer all want the best there is. And if you have got it the market is yours. This theory will not always hold good on some of the more common garden products. But as a rule it is true. And we want to emphasize this idea, that the gardener must make a reputation for his produce as a manufacturer does for his wares. Who questions a package of oatmeal on which Pillsbury puts his card? You do not ask your grocer to open the package that you may see inside. You know what is inside because Pillsbury put his name on it. You may stovepipe a consignment of potatoes and dispose of several dollars of small ones but if you are a constant shipper it may prove an expensive deal. This reputation should have three features, viz: To produce an article as the market demands it, to produce it at the time it is most in demand, and to give it that care, neatness and honesty that will demand more of the same. It has been said that a bean is a bean and a pea a pea, and that they will bring the same price if of good quality. Permit us to relate that last season it was our misfortune to have about twenty-five sacks of Stowell's Evergreen sweet corn. It was fine. Almost free from worms and nice, large, well filled ears. It was put on the market in common with field corn and any other product that bore the name of corn. A very few sacks sold for sixty cents, but most of it sold for about thirty-five cents. The remainder of the crop was fed to the cow. Others who had themselves established with the market people for a good quality of sweet corn were able to command a living price even when the market was flooded with it. There is no doubt about this holding good through the entire list. A reputation for being a good gardener will help one but little in marketing. The reputation must be for the product. If we do not concentrate our efforts we can not produce the excellence of quality. we cannot produce the quantity, neither can we know the market. In preparing for market we must not be afraid to cull. Some flower gardener said that it takes a brave gardener to pluck large, strong, rich buds containing prospective beauty. Yet it must be

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

PEACHES ON COTS.

Editor Cultivator: Can peaches be grafted on apricots?—A. B. San Jose.

Peaches may be grafted on apricots, but it is not advisable. The union is not good and there is such difference in the rapidity of growth in the two classes that such a process is not considered a success on old or partly grown apricot trees. Apricots are usually budded on peach in the nursery. The trees are then young and they adapt themselves to each other to a satisfactory degree, though even then the union is not always perfect. The peach is a faster grower than the apricot and outgrows the latter while young, but the apricot keeps it up long after the peach gets to its limit. Peach budded on apricot in the nursery, makes a kind of a dwarf tree which comes into bearing sooner than when budded on peach and produces crops that require the severest kind of thinning.

* * *

FRUIT TREES FOR ARROYO GRANDE.

Editor Cultivator: What is the best variety of walnuts for sandy land (free black loam), 60 feet to water; land very wet in winter? What are the best sort of apricots and apples for this section and at what age should they be planted? Will chestnuts do well here?—M. H. S., Arroyo Grande.

Placentia Perfection is considered the best walnut in the districts tried in Southern California and since it has been demonstrated that the best varieties in the coast districts also do well in the interior valleys, we would not hesitate to plant them. In the hot interior valleys of the Sacramento and San Joaquin, Franquett does the best. These are nuts of the highest type. Your description of the land is alright for walnuts. Have trees grafted on the native California walnut and you will make no mistake.

Royal and Hemskirke are reported to be well adapted to your district. Should any new variety have recently been tried and found good in your section, inquiry will soon determine its virtues.

Jonathan, Yellow Bellefleur, White Winter Pearmain, Yellow Newton, Pippin and Early Harvest have a good reputation in your part of the country.

In regard to chestnuts, it is our opinion that they will do well with you, as these seem to be well adapted to all parts of the State. It should be borne in mind that some trees will always bear empty burrs and such trees should be grafted over, taking scions from trees that do bear good nuts.

In planting any kind of a fruit tree, always use one year old trees.

* * *

POLLINATION OF APPLES.

Editor Cultivator:—I have a fine orchard of W. W. Pearmain apple trees about thirteen years old, 460 trees in a square. On the south are joined by Newton Pippins. These bear very heavy. On the east are Wine Saps. There they bear pretty well, but on the two sides where there are no other varieties the crops are light and are getting worse every year. Land is rich, valley land. Now what I want to know is, do they lack pollination? If so, what kind of trees should I graft from? Would Bellefleurs do?—Reader, Lompoc, Cal.

We would advise you to graft over a row of trees on the two sides that refuse to bear. If Newton Pippins do the work we would use them. It might be well to experiment with a few Bellefleurs.

* * *

TOKAY AND CORNICHON GRAPES.

Editor Cultivator:—In the last issue of the "Cultivator" I read an article about Tokay grapes. If J. R. U. of Tropico wants to find a remedy for pale color in Tokay's he will find it in location. I have no trouble in securing a deep red color on our mesa lands, north-west of Compton. I am not in favor of trellising Tokays, as they sunburn very easily. They are naturally a vigorous, upright grower, and by proper pruning from first planting they can be trained into a neat dwarf tree shape with plenty of fruit spurs which I think gives the best protection to the fruit in all stages of growth.

I am also much interested in the growing of Cornichon grapes. Can raise a splendid quality with a fine bloom and color. But the yield is light by the common method of pruning. Does the editor know any method of pruning that will increase the yield with this queen of grapes.

Yours very respectfully,
GEO. D. LEE,
Compton.

We are glad to receive the result of Mr. Lee's experience and hope others will follow his example and "speak up." We never have seen the Tokay trellised "on the inside," but in the desert regions where strong-growing varieties make canes ten to sixteen feet long from the cutting the first year short pruning does not give the best results.

Cornichon has given better results with us when pruned half long, that is, with canes having four or five buds We keep the vines under control by leaving a spur with two buds, at the base of the half-long canes, thus enabling us to continue the process after the entire removal of the half long canes with their summer's growth of brush.

* * *

GRAPES FOR SANDY SOIL.

Editor Cultivator:—Will you please answer the following questions. I have charge of 20 acres along the old river bed. It is too cold for oranges. I want to set it to table grapes. Being a new-comer, I know nothing about such things. What varieties will be best adapted and most profitable? Would you set several varieties? Would it be wise to set grapes that are suitable both for table and wine? What varieties would you recommend? What qualities for table grapes have Mission and Malvoise? What is usually the demand for them? This ground is sand and gravel. What grapes are best adapted to sand? I am told that grapes can be grown without irrigation. What do you know about it? Tell me how to handle the cuttings that they may do their best.—K. L., San Bernardino.

There will be a brisk demand for table grapes in Southern California markets from now on and the wine industry is in a fair way to be supplied from the 10,000 or so acres of wine grapes that are now in bearing in San Bernardino county. This area is being added to by a thousand or more acres every year, hence our advice is to go slow on wine varieties. The fact that large companies control this product makes a difference.

Mission is no longer classed with our table grapes. There are so many varieties that please the eye better

ASPARAGUS CULTURE.

It is not my intention to deal with the history of asparagus or with the different diseases and insects which hinder its growth, but to describe as clearly as possible the methods of growing it.

First in importance is the selection of the best possible land. Asparagus will grow on different soils from a clay to the sandy soil, but the best results have been obtained on a rich sandy loam with a clay sub-soil which has good drainage. Heavy soils bake so that the shoots are unable to reach the surface, while on the other hand the more sandy soil has not enough substance to produce thick stalks.

There appear· to be two ways to secure plants. First by buying seeds and raising the plants, and second, by purchasing plants of a good reliable nurseryman.

In the first case care must be taken that the seed are obtained from a good healthy field free from all disease, and better too that the plants be well developed and of vigorous growth. It is a safe wav to pay a good price for seeds to a reliable house rather than to bother with cheap seeds.

In preparing the soil in the nursery for the seed the ground should be well pulverized and of sufficient moisture to sprout the seed. Care should be taken that the land be well levelled, allowing no place to flood. As soon as the ground gets warm enough, which, in the desert, is early in March, the seed may be sown.

In planting the seed in the nursery the garden drill is a convenient tool, allowing one seed to every three or four inches. It will be found that one pound will produce about three thousand plants.

It is of utmost importance that the nursery be well cared for for the first few months especially. As soon as the shoots are six or eight weeks old they should be thinned, allowing only the largest to remain. Frequent cultivation and hoeing will add greatly to the thrift of the growing plants. On irrigated land they should not be flooded, but watered by a shallow furrow between the rows.

In the following November or December after planting it will be seen that the green foliage commences to turn yellow and die. After it is well turned is the time to cut the tops and prepare the ground for permanent setting.

In buying from a nurseryman, the plants should never be over two years old, and it is better if they be only one year old, as the young plants, when set in their permanent beds are found to make a much more rapid growth at that age. Then, too, if the plants are allowed to stay in the nursery for two years nothing is gained for they need to be two years in their permanent bed before any sprouts can be cut. There a year is lost and the plants are less vigorous.

In preparing the soil for the permanent bed the ground should be well levelled and plowed to a depth of fourteen to fifteen inches. If plenty of manure can be obtained, it would be well to have that well worked in with the soil before planting.

Trenches should then be made twelve inches deep and six feet apart running North and South, in order that when the plants commence to shoot they will have the sun's rays unaffected by shadows. No trees should be allowed to grow very near the field, as they draw the nourishment from the plants besides shading the growth.

The home-grown plants have the advantage of the nurseryman's in two ways. One can choose from his own stock, selecting the largest, best rooted and crowned plants, and selection is an important item. Then, again, the plants, as soon as dug, can be reset at once, while if they come from the nurseryman, you take what is sent and when the railroad chooses to deliver.

After selection, the plants should be set in the bottom of the furrow two feet apart, with the crowns right side up. As soon as one row is set the trench can be filled and the setting go on. Some prefer covering the plants with only a few inches of dirt, and as the shoots grow taller adding a little to the top. In this way the plants can be irrigated in the trench.

The better method is to cover well to the level with dirt, making furrows on each side of set and after irrigating to cultivate thoroughly.

It will be found that asparagus needs constant attention for a good part of the year, and the more intense the cultivation and hoeing, especially in the spring, the better the results.

The amount of irrigation varies in different sections. In the desert once a month regularly and in the hot months twice will probably be sufficient.

For fertilizing in the fall plow a furrow eight inches deep between the rows of plants and half fill with horse, cow or sheep manure. Then plow back the furrow and irrigate.

In this way, especially in the desert, the hot sun does not dry up the manure. If sufficient fertilizer cannot be obtained for a large field, fertilize one section a year.

The first cutting of the grass for market may be made in the spring of the third year from seed. The season should be a short one, as the plants are not yet fully developed—three or four weeks is long enough. As the plants grow older the shoots get stronger, and consequently the stalks larger and more abundant. Eighteen or twenty years is supposed to be as long as it is profitable to cut a field, although many are cut for a longer time.

If it is desired to have white shoots a system of banking should be pursued, otherwise the stalks will be green.

As to the cost of putting out an acre of grass. It depends upon the value of the land, the cost of labor, and the condition the land is in. The amount of profit depends upon the richness of the soil, the amount of attention given to it, express rates, and lastly, the honesty of the commission man.—R. B. Thayer, Thermal.

GOOD, big "mealy" potatoes can not be produced without a liberal amount of POTASH in the fertilizer—not less than ten per cent. It must be in the form of Sulphate of POTASH of highest quality.

"Plant Food" and "Truck Farming" are two practical books which tell of the successful growing of potatoes and the other garden truck—sent free to those who write us for them.

TREES

CALIMYRNA FIG

There are a great many sorts of Smyrna Figs. We catalogue six kinds, but these do not comprise our entire collection. There is only one variety, however, which five years production on a commercial scale warrants us in recommending it for drying purposes, and this particular variety we have designated as above to give it the distinction it deserves. When you buy your trees from us, you know you are purchasing stock originating from pedigreed trees, which have been producing the highest grade of fruit for a period of years. When you purchase a thousand peach trees, you usually designate what you want. You certainly would not permit your nurseryman to send you a lot of varieties, without labeling them, if you could help it. Well, it is the same with the Smyrna fig, some are early, others late, some are purple, others green. Can you afford for the sake of saving a few cents to take chances on buying trees, which cannot be relied on. We were the first ones to demonstrate the value of this fig, and with our seal we guarantee the genuineness of our trees. Prices lower than ever before.

FRUIT TREES

Are grown on a deep, alluvial river bottom, virgin soil, consequently the root system is as perfect as good soil can make them. Our assortment of apples, pears, peaches, prunes, apricots is more complete than ever.

ORANGES AND LEMONS

Our stock is grown in Exeter, the famous thermal belt of Tulare County. The soil is a rich, deep, black loam, just the kind which develops the highest grade of fruit, as well as the most perfect type of tree. Our assortment consists of all standard varieties of Oranges, Lemons, Pomelos, Citrons, Limes, etc. Carrying out the lines already established in the other branches, we do not confine ourselves to one or two standards and no more, for although it costs money to keep up a stock of many varieties, we want to be on top in this, as well as in everything we specialize in the nursery business.

GRAPE VINES

If you do not know it, you ought to know that we are the largest growers of vines on the Pacific Coast. We are not only growers of raisin, wine and table grapes, but we are also making a specialty of vines grafted on Phylloxera resistant roots. Our great and enterprising neighbor, Mexico, is having its vineyards devastated by this pest, and we have already sold two orders to prominent vineyardists there, who know what our stock is, consisting of eighty thousand grafted vines. How did we get such orders? Because we had pleased our customers before, so they had no hesitation in patronizing us again.

ORNAMENTAL STOCK

Our stock of Texas Umbrella trees branched in all sizes, guaranteed absolutely true to name, is better than ever. We are extensive growers of Poplars, Mulberries, Maples, and all deciduous ornamental trees suited to our conditions.

In evergreens, we have Acacias, Eucalyptus, Palms, Roses, Greenhouse plants, in fact everything you want for your garden.

OUR NURSERIES

Eleven hundred acres in four distinct places. Expensive to run a business so widely distributed. We konw it. Why do we not concentrate all in one place? Because we want to be in the position to grow the best of everything, and to do this, must select the soil to suit the tree, shrub or vine. No use to grow a tree where you know beforehand the conditions are not favorable for its perfect development. That is what twenty-one years of experience does. It places us in the position to grow the very best stock. In making a plea for your trade, we do so, not because we have the cheapest stock, but on the ground that when you favor us with your business, you will get the best which money, brains and experience combined can grow.

CATALOGUE

We will mail our large profusely illustrated Catalogue, English or Spanish, to any address on receipt of 5¢ postage. Price-list mailed on application.

PAID-UP CAPITAL, $200,000.00.

FRESNO, CALIFORNIA

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

NEW ORCHARD PLANTING.

In spite of the old cry of over-production of fruit, people keep on planting as heretofore, just as though no one had discovered that we are growing too much fruit. The tendency now, in the deciduous fruit sections of the upper country is in the direction of peaches and apples and there will be a much larger acreage of these two fruits set out this season than any other. In fact, the old-fashioned apple, in such sections as are suitable to it, appears to be largely in the lead. There is always a good demand for it and usually at good prices. The great drawback to its production is the Codling Moth but by persistent and judicious work this pest can be checked. Peaches come next, and this fruit is the favorite in the warmer interior sections, where the apple will not do so well. Last season, owing largely to the short crop, there was a very active demand for peaches and prices were something extraordinary. This has indicated a sure demand for this fruit and has given a fresh impetus to its planting, although there has been a very active planting of peaches all over the warmer sections of the northern counties for several years past. The cry of over-production is very much of a bugaboo at all times, for while there will always be occasional seasons of depression in fruit growing, as in all classes of business, it will average with any other business in the long run, and there is one thing certain we shall never produce too many apples and peaches.

* * *

DO NOT FEAR ASPARAGUS RUST

It was the absence of the disease known as asparagus rust, which had proven so severe a plague in the Eastern asparagus sections, which gave its first impetus to the asparagus culture in California. Some three years ago it was discovered that this disease had obtained a foothold in our principal asparagus sections, and for some time it was feared that the industry was doomed in our state, but it has been discovered that the disease can be controlled to some extent, and that while it is troublesome and somewhat expensive to check, the production of this vegetable still leaves a very respectable profit to the grower, and the danger resulting from an attack of the disease is not nearly so severe as was first feared. In consequence there have been some very extensive plantings of asparagus in the bottom lands and islands of the Sacramento and the San Joaquin rivers. In San Joaquin county at the present time work is being prosecuted in the planting of one tract of five hundred acres This will be but one of several large tracts pl[illegible] to this succulent, most of which is [illegible]ed for canning purposes, although very large quantities are shipped fresh to the Eastern market. California has made wonderful strides in asparagus culture in the past few years and there is little doubt but that within the next few years she will lead the world in its production.

* * *

THE STATE FAIR.

The last State fair was a very long stride in the right direction toward making this institution, what it was originally intended to be, a representation of the agricultural industries of the State, a goal from which it had very widely wandered under previous managements, until it had become a mere horse-racing event supported by the State. The first move in the direction of reform was made last fall, but the faith and interest of the agriculturist had been lost and he could not realize that he had any interest in the matter, as a result while a great improvement on most of its predecessors, the State fair was not altogether what could have been wished. The intent to make it really and truly a State fair, however, was displayed, and now Governor Pardee in a letter to the directors, has outlined how it may be brought closer to the producers and made what it was originally intended to be, an exposition of the agricultural wealth of the State, a place where can be brought together the best results of the labors of our producers, and where they can learn from each other the best methods which experience teaches. The Governor has taken the matter of reform in hand and is working with the directors to this end and there is no question but that the State fair will be a thing in which all our farmers, fruit growers and producers generally will take pride, and no longer a mere gambling and horse-racing event.

* * *

MORE EXPERTS TO FIGHT PEAR BLIGHT.

The Valley Development Association at Sacramento has guaranteed to meet the expenses of four additional experts on the pear blight who are to be sent from Washington to take hold of this serious proposition in connection with Professor Waite who has already done much work along this line. It is on Professor Waite's suggestion that this action has been taken, and it is his idea to put as large a force in the field as possible and stamp out the blight in one season, and having stamped it out to take all necessary precautions to prevent its entrance again. There can be no possible objection to getting all the expert assistance available in this matter which is a most serious one for one of our principal deciduous fruit industries, but we question whether the proposition to stamp it out in one season or in any series of seasons is practicable with a hundred times the number of men which we can get at the work. California is a big state and the pear blight has practically covered the whole of it; it is found in all sections where the Bartlett is grown to any extent and it is an impossibilty to exterminate it. It will stay with us as long as we grow pears. The work which can be done by the gentlemen now engaged in it is to teach the orchardists how to fight it, and to this end we may hope for good work from the Washington scientists and also from the University people. When they have done this they will have accomplished much, but the work must then be continued by the individual orchardists and enforced by the County Horticultural Commissioners.

She—Do you believe there are microbes in money, dear?

He—Yes, but they can't get through it any quicker than you can.—Yonkers Statesman.

With the Citrus Growers

BY J. W. MILLS

WINTER GREEN MANURING.

When the practice of growing green crops among the orange trees was first advocated, it was condemned by the greater body of growers as impractical. Inconvenience at picking time, extra water was required which would make it too expensive, expense of plowing under and inconvenience of working the land with a lot of weeds to clog the cultivator and so on; there were innumerable things that made green manuring unpopular. So clean culture was practiced almost exclusively by the great body of California orange growers. The practice of growing green crops was urged incessantly by the officers of the farmers' institutes. The experiment stations made exhaustive tests in order to find plants of the family of legumes that would make a satisfactory winter growth. This was one of the timely experiments that served the growers well, for the teachings of the farmers' institutes soon bore fruit and the questions regarding the best crops for the purpose came pouring in. Of a hundred or more varieties, about half a dozen proved to be good winter growers. The Canadan pea took the lead and until the last year or two was almost universally planted. It came in second in the race with large growers who found it difficult to do all their plowing at a time when the pea should be turned under. If this is not done at the proper time the delay will permit the vines to become fibrous and they will not rot enough during the summer to permit of proper cultivation. During the wet winter of 1904-5, all kinds of green crops made a prodigous growth and it was late in the season when the most of these crops were turned under. It was then demonstrated that the pea vine was objectionable for late plowing. It was too stringy and fibrous. The vetch was found to be tender and soon rotted completely.

This feature is a valuable one and has given the vetch a boom with some of the Riverside growers. The main disadvantage with the vetch is that it does not grow as luxuriantly as the Canada pea, but this is partly overcome by early planting. If vetches are planted late in September and given plenty of water, enough to keep them growing, they make a satisfactory growth. A given quantity of vetch is of greater fertilizing value than the same quantity of peas, consequently the difference in the sizes of the two crops is not such a difference after all.

There is a theory among some of the Riverside growers that late plowing has a tendency to cause the dropping of the fruit. The cause is supposed to lie in the effect produced by cutting the fibrous roots at the time when the fruit is setting or near that time. This however, is only a theory and does not agree with the practice which was at one time in vogue among apple growers. They root pruned their trees to force them into bearing, the theory being founded on the supposition that any shock to the trees would cause it to make a last effort to reproduce itself.

The practice of growing green crops has not yet been followed long enough to show what it is really worth. This refers to the orange districts in California, still the effect on the heavier red soils was quite marked after the first year of green crop growing. In one of the Riverside groves which lies on a hillside, a distinct line of demarkaton could be seen where the peas could be seen for half a mile. The strip of land between the rows where the peas grew was a shade darker, being free of large clods. The mass of fine roots of the peas had made the soil mellow and when turned over by the plow the clods fell to pieces. Where there had been no peas growing, the soil was more solid and remained in large lumps when turned over by the plow.

The ill effects of clean culture during the past eight or ten years has been so apparent that all the former objections to green-manuring crops have disappeared, instead of objecting to the inconvenience of having a lot of green stuff in the way, the cry is, "What will give us the largest amount?" Legumes that produce early abundant crops are now demanded.

ABOUT OUR LEMONS.

As the California lemon becomes better known it is coming more into favor. Conditions for lemon culture are different from that of oranges. The interior grows a good long-keeping lemon, with the season for a crop more like the orange. On the coast, with its damper and mild atmosphere the lemon is more a continuous bearer with a climate less favorable to long keeping. By common consent the orange is not quite as successful on the coast as in the interior, and so it comes that the coast is making more of a specialty of the lemon. The market for this fruit, like the orange, is constantly extending. The supply in many cases creates the demand. The luxury of yesterday becomes a necessity of today, and so the market increases year by year and the whole business of citrus fruit growing will ultimately settle on a solid basis in which the element of speculation and extremely high profits will be eliminated and fruit growing on a family scale or in small tracts will afford many a family the health, happiness and means of living they vainly strove for elsewhere.

ORANGE SOILS.

The very best soils for orange culture seem to be those in which iron is largely present which may be known by their red color; foothill soil composed of decomposed granite with clay enough to prevent leaching by the water used in irrigation and having permanent water so far beneath the surface that the tap root of the tree will not be able to reach it. The soil must also be open enough to allow the water to percolate freely so that irrigation will wet all of the soil both laterally and perpendicularly so far as the deepest offshoot of the taproot may wish to extend. This means a warm dry subsoil without which the highest success is unattainable and unless this condition of soil is present sooner or later disease will supervene in the roots. A well drained rich warm foothill soil then is the first essential in California for the best success in orange culture.

Waite, Bailey & Lynch, buy, sell, exchange, repair and install gasoline and steam engines, boilers, air compressors, power pumps, etc. Otto gasoline engines, all sizes, to 200-H. P., better built, more economical, therefore superior to all others; prices and terms that will insure due consideration. 943-945 N. Main st., Los Angeles, Calif.

Not touched by the frost.

A. P. Griffith, Azusa, Cal.

ChinoRanch

The Chino Ranch is the richest water-bearing tract in Southern California. Its water supply exceeds that of Los Angeles. It is only 90 minutes from Los Angeles and the transportation facilities are unsurpassed. It is close to eager markets and has good schools, churches and fraternal orders. The soil is rich and fertile and the variety of profit yielding produbts is wide.

Chino ranchers are acquiring comfortable fortunes with alfalfa, oranges, walnuts, sugar-beets, deciduous fruits, onions and onion seed, Egyptian corn, etc. Appointments to visit the ranch under our auspices can be made at any time. Trains leave Los Angeles daily via Southern Pacific at 8:05 A. M. and 5:25 P. M.

Ten-Acre Lots, $75 to $200 an Acre

TERMS—¼ cash; balance 1, 2, 3 and 4 years; 6% interest. An unlimited Certificate of Title may be secured from the Consolidated Abstract and Title Guarantee Co., of San Bernardino, Cal., by all purchasers of Chino Lands.

Chino Land and Water Co.
Main Office at Chino, Cal., or 720 Trust Bldg., Los Angeles, Cal.

ORANGE TREES
Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County

Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.

E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Angeles, Cal.

Orange Seed Bed Stock

I have some 50,000 fine seed bed stock for sale. These plants are good color and very thrifty. Absolutely clean and healthy in every way. I will make them caliper 3-16 of an inch and up to ⅜ or ½ inch. Owing to the large size of the plants the packing will necessarily bring the price above the ordinary price of common sized plants, but they will be sold cheap, and if you intend setting it will pay you to see this stock.

J. M. Baker - - - Glendora, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

NATURE STUDY IN COMMON SCHOOLS.

Within a few years Nature Studies have been introduced in our high schools. This is well, but how much better to also have elementary work in the same line in the common schools. All who are deeply interested in the best welfare of the masses are decrying the fact that so many of the farmers' children are rushing to the cities. It is not strange, when we consider the little that has been done in the way of educational laws to interest and instruct the child in his surroundings upon the farm. Even the laudable effort of providing libraries for our rural schools will largely fail in fulfilling its purpose under the present arrangements. A large per cent of our country population ought to remain upon the farms. Then how important that we provide methods and forms of education that will, first inculcate a love for country life and labor and, secondly such a knowledge of vegetable and animal life as will enable him to thus utilize and control the laws of nature, so that all possible financial returns may be obtained.

How much better for child, parent and community, both for the present and for the future, for the scholars to become interested in such scientific study and practical work than even to spend the time largely in reading trashy, blood-curdling novels, gossiping about their neighbors, playing tricks of various degrees of meanness in the community, not to mention the wasted time, spent dancing, playing cards and rehearsing "shady" stories. All thinking, unselfish people are today as never before, seriously pondering over the best and most practicable methods of eradicating or effectually controlling the great and destroying evils abroad in the land, like intemperance and vice in all forms. Whatever may be attempted or accomplished, it is evident that greater and still more strenuous efforts must be put forth to keep the youth, from their earliest perceptions, busy in mind and body, by study and work in all lines as displayed upon the varied pages of the voluminous book of nature. The active, observant, diligent and informed person in the direction herin mentioned, will never become a subject to the grosser habits or evils but the indolent, ignorant and careless person will almost assuredly become a menace to the family, community and the state.

PLANT NOTES.

During the summer palms will need an abundance of water, and at no time should they suffer for moisture. When the plant requires water, the surface of the soil will look dry, and enough water should be given to thoroughly soak the ball of the earth and the roots.

Have you a flower bed so constantly exposed to the intense sunshine that everything seems scorched and valueless? If other plants refuse to grow in this trying bed, plant the portulacca. These plants thrive in the heat and drouth that will quickly destroy many others; their bright flowers are borne in abundance.

The effect of growing aquatic plants upon lawns in tubs or pools is charming. No class of plants could give more pleasure and none require less care. A simple plan is to saw a barrel or hogshead in two parts and cleanse them thoroughly; set them in the lawn; fill one-third of the depth of the tub with good soil, and in this plant the root of the water plant; then fill the tub with water. No further care will be needed except to replace the water as it evaporates.

In order to have palms appear at their best it is necessary to keep the leaves free from dust by sprinkling or washing them once a week.

Plants that are set out in pots should be pinched back frequently so that they may acquire a good form and an abundance of blooming shoots.

Gather bouquets in the morning, while the dew yet adheres to the blossoms. Flowers retain their sprightliness much longer if gathered in the morning than at any other time in the day.

Do not undertake to keep more flowers than can be given good attention. A few choice plants kept in a good, thrifty condition will give much better results than two or three times the number carelessly attended to.

In fertilizing the plants that are in bloom to increase the supply of flowers, apply in liquid form and the result will be immediate, giving larger flowers and richer coloring, as well as greater numbers.

Lack of water is the cause of many plants failing after being planted in the open ground. It is almost impossible to injure large, healthy plants by over-watering in the summer time. Plants should never be allowed to get dry at the roots, though they should not be watered until necessary; then give plenty.

THE HOUSE LEEK.

The houseleek (sempervivum) is frequently cultivated on the roofs of houses in County Clare, Ireland, it being a common superstition that the house upon which it grows cannot be destroyed by fire. The plant is there known as the "man of the house." The old-fashioned plant is very common to all parts of California and but little note is taken of it. However, when one gets "stumped" for a plant that will grow under most discouraging conditions he often turns to the trustworthy old "house leek."

WATERMELON SEED

For years my Chilian watermelons have brought from ten to twenty per cent above the standard market price paid for any other watermelons. This on account of superior seed, which I have always grown myself and have improved each year. I have now the best ever grown, and can supply the same in small quantities, for a short time only. Price $1.50 per lb.

J. C. Ostergard, Burbank, Cal.

100,000 Brandywine Strawberry Plants

The very best that skill and intelligent, up-to-date methods can produce. These are Kellogg's strain and have been propagated from stock that was not allowed to bear fruit. We do not plant for ourselves, nor offer for sale, plants propagated from bearing beds. Growing the fruit, and growing the plants, are two distinct operations with us.

It costs no more to fit the ground, plant and care for the best than the poorest. Visit our grounds and let us show you how vastly different is the result. We grow only Brandywines, as out of 20 varieties tested they have stood the test. From February 1st to April 1st is the best time to plant, we think. Orders will be booked and filled in the order received. One significant fact that may interest possible purchasers: We sold $1563 worth of berries from one acre of this strain of plants last year. LILLY'S BEST ROSES.

Invite the Rambler Family
and Have Them Bring the Baby

The Ramblers are the aristocrats of all Roses. The Baby Rambler (Mme. Levavaseur) is a dwarf crimson beauty which blooms with all the luxuriance of a climber. The Baby is ever-blooming and while it attains a stature of only twenty-four inches it contains as many roses as you would expect to find on a bush five times its size. The Baby is the pet and the pick of the Rambler family.

The demand for the Baby is large and we fear that our supply may not hold out. You and your friends had better place your orders early. Home is not a home without a "Baby."

Prices, one Baby Rambler root 75c; Six, $3.50; Per Dozen, $5.00

Our rose roots are Northern, out of door grown. They are hardy roses and are packed for shipment with extreme care. They will arrive in perfect condition ready for immediate planting.

Crimson Rambler—Grandest climbing rose ever grown, presenting its crimson blooms in pyramidal clusters which contrast beautifully with the bright green foliage and keep their color for weeks. Very hardy and will grow most anywhere. Each.........35c

Our 1905 Catalog is the Largest, Best Printed, and Most Comprehensive Seed and Plant Catlog issued on the Pacific Coast. You want it if you love Nature.

Philadelphia Rambler—Similar to Crimson Rambler but deeper in color and more double. Each...........35c

Pink Rambler—Like the other Rambler in habit of growth, producing in cluster of from ten to thirty blooms of a shell pink, fading to almost white. Each......35c

Dorothy Perkins—The best Pink Rambler. As hardy as Crimson Rambler and of the same habits. Blooms more double and curled, and holding their color a long time without fading. Each..............35c

White Rambler—Almost identical with Crimson Rambler except the blooms are pure white and very sweet scented. Each.................................... 35c

This is a healthy family—baby and all. They do not mildew or become easily a prey to insect growth. They are all sure bloomers.

This family of Ramblers (including the baby) sent to any address for $1.50 charges to be paid by purchaser.

In the Vegetable Garden

BY ERNEST BRAUNTON

THE KITCHEN GARDEN.

The economic importance of the kitchen garden is but slightly appreciated in California, and as a consequence it is given but careless attention. It is no difficult matter to curtail the table expenses one-fourth by giving a garden of less than one acre the care and attention it deserves. Favored as we are with soil and climatic conditions, fresh vegetables of a large variety can daily be gathered from a well kept garden throughout the entire year. On the other hand, conducted as the gardening operations too often are, the results neither afford profit nor pleasure.

RECOGNITION OF MUSHROOMS.

Now that the wild mushroom season is with us we may be pardoned for cautioning those who gather them to use great care in their collection. Plenty of rules have been laid down for the novice, but most rules have exceptions, which are well known to experts, but the beginner is of course under the necessity of following the rules implicitly, for an imperfect guide is better than none at all.

It is a rule of whist that when one is in doubt he should take the trick, but in the case of fungi the reverse is true. If one has any doubt as to whether a fungus which he has collected is edible or not, he should act on the suppossition that it is not edible, or at least that it is under suspicion, and should be experimented upon with great care.

The different popular tests for distinguishing edible from poisonous fungi, such as, for instance, the blackening of a silver coin or spoon when placed in a mass of poisonous fungi while they are being cooked, are all absoultely worthless. There is no test which can be applied, nor should reliance be placed, at least by the beginner, upon the fact that in some cases the poisonous substances may be removed by cooking in milk or vinegar.

In such cases the danger may be only increased unless care is taken to remove all the vinegar or milk, and, in general, common sense warns us not to eat any fungus supposed to contain an active poison which requires to be removed by special treatment. The eating of such species should be left to the scientific experimenter. On the other hand, it need not be assumed that a fungus is poisonous when it is merely indigestible in consequence of the way in which it is cooked. There a few rules (about a half dozen) upon which the inexperienced collector may rely with some degree of certainty, yet not all of them are absolutely reliable.

POTATO SCAB.

Use two ounces of corrosive sublimate to sixteen gallons of water. Dissolve the poison by first wetting it with an equal amount of water, stirring it until it is all made fine and is thoroughly wetted. If it is to be used at once, it should be turned into about two gallons of hot water to dissolve it quickly. Never use metal dishes. Always take an earthenware or glassware, or wooden pails.

For treating small quantities, barrels, half barrels or tubs may suffice. The tubers may be inclosed in a coarse sack and thus immersed. or they may be poured into the barrel and when ready to be removed, a burlap cloth can be stretched over the top of the barrel and the liquid strained into another vessel, and the potatoes dumped on the ground.

For treating larger quantities, a less laborious method would be to use a long and rather narrow box, or a watering trough can be used. The tubers can be taken out with a wire or perforated wooden scoop. The tubers should soak about one and one-half hours. After soaking three pecks of potatoes to each gallon of solution, if there are many more to treat, about three-eighths of the original amount of corrosive sublimate should be added, together with sufficient water to replace what has been wasted in removing the potatoes.

All wooden vessels that have contained the solution can be made suitable for general farm use again by washing thoroughly in clean water and then in water containing a little sal-soda.

Soak the potatoes when ready to cut the seed. Of the two operations the soaking should preferably be done first, although it is not necessary..

The expense of this treatment is very slight, consisting merely of the cost of the poison and the time of putting the potatoes in and taking them out of the solution. The operator may be employed the balance of the time in cutting the seed.

SEED POTATOES.

Potatoes intended to seed should never be put together in large heaps or pits, but should be spread out thinly in a cool, dry place. If they can be exposed to the sun all the better, as the greening of the tubers hardens them, and renders them less liable to rot. If possible, the seed should be planted before they send out the first shoot, which generally starts from the crown. When this takes place, the other eyes seldom start at all; the result will be only one very robust stalk to the plant, which will produce nearly all large potatoes.

BRANDYWINE PLANTS
Brandywine Strawberry Plants for sale, Kellogg's strain. No better nor thriftier plants grown. Clean of all disease; at bottom prices.
G. W. MULLENDORE, COVINA, CAL.

Seedless Blackberry
The main crop has no seeds. Very early, extra large and very prolific.

ARE TWO AND THREE INCHES LONG—
BURBANK'S PHENOMENAL BERRIES
One will Fill a Cup. Dwarfs Giant Dewberry in Size and Excels Raspberry in Taste.
How to Get Hardy Roots.
The leviathan of the berry world is the latest California wonder, Burbank's Phenomenal Berry. Mr. Burbank has said: "It is larger than the largest berry ever grown." To those who know the conservative nature of the man his statements as to size and quality are the best guarantee that could be given.
It is a cross between the California Dewberry and Cuthbert Raspberry.
In color and flavor the new fruit closely resembles—some say "excels"—its rich-hued raspberry parent.
It's the Best Berry in the world —LUTHER BURBANK.
Its liquid juiciness when pressed by the tongue surpasses the full-ripe dewberry in delicate consistency.
And most marvelous of all, to this toothsome fruit has been imparted a firmness which holds it in shipping conditions for days, making it one of the most practical berries for home or distant markets.
GROW IN HUGE CLUSTERS
The vines are inclined to trail. When properly supported, the berries are quickly and easily gathered. They grow in immense clusters of from five to ten huge berries, a sight to delight and amaze. No berry is so economical to pick.
We have grown a limited number of roots in our experiment gardens on Puget Sound, and can supply in quantities of one to one dozen.
The conditions under which these roots were grown insure that they are hardier and more robust than can be obtained from southern nurseries.
Use coupon in ordering. Price (prepaid) per root 35c; per doz. roots $3.
Order Now—The Supply is Limited.
LILLY'S KITCHEN-GARDEN COLLECTION OF BERRY BUSHES
Roots of 12 Standard Berries: 1 Logan Berry, 3 Raspberries, 2 Blackcaps, 2 Currants, 3 Blackberries, 1 Lucretia Dewberry, each one properly labeled, no two same variety. By express at your expense $1.00, prepaid $1.25. You can include one of the Phenomenal Berries at 25c when ordering this collection.

College Farm to be Settled.—The announcement is made that Governor Pardee has called a meeting of the State Farm Commissioners at the Capitol, this week, to determine on the final location of the college farm. This will be interesting reading to something like twenty localities which have petitioned for the farm. The Commission has certainly taken time enough to determine the best location for this important proposition and we feel positive no mistake will be made in the selection which may result. The Cultivator has heretofore discussed this question and given its opinion as to the needs of the farm. Nothing now can be done except to emphasize the importance of making the farm so practical in its operation that it shall be indispensible to the State of California as an educator.

* * *

Planting Fruit Trees.—The season is at hand when the farmer and orchardist should be putting in his trees, indeed now is the time for such work. The Cultivator would like to say a word along this line, especially to new comers to the State, who have had no experience in California with tree men or tree planting.

Every year a large number of farmers and orchardists are more or less deceived by unscrupulous agents of nursery stock, and in such a manner that years elapse before they discover it. For this reason a few words may not be amiss if they bear a measure of warning and advice to prospective planters of trees, and especially to those who have not had experience.

In the first place it is usually well to buy from a local nurseryman, sometimes from a small nursery in your own community. But the proprietor must be a nurseryman in every sense of the word. If he is not systematic and does not keep his nursery in order but has varieties so mixed that the proof of the tree is the fruit, it were as well one should buy from a tree jobber who never grows a tree, but buys where he can and sells likewise. In the southern states there are vast plantations for the growing of nursery stock. These young trees are disposed of at wholesale to tree-jobbers and sold by them as a "nursery company, labelled "northern grown" trees or "home grown" trees. These trees, if true to name, are of course not objectionable, for are yet much of our deciduous nursery stock comes from the south, more in the past than at present, still we are getting considerable, of especially deciduous. The only state where unusual precauiions are being taken is Florida, where the White Fly exists. The claim is often made of the superiority of budded trees and the same as to grafted trees. Experiments carried on in an impartial manner over a dozen years have demonstrated that there is no practical difference between the two. It should not always be charged that the nursery agent is dishonest when he sells trees which are absolutely worthless in a given locality, for his action is often due to gross ignorance. There is a growing practice among nurserymen which may be heartily commended of seeking to be represented by some honest farmer of the community who has the advantage of age and experience and has been successful as a fruit grower. There is so great a range of conditions that it is impossible to make extensive recommendations as to what varieties to plant. If there is a good orchard in the community the best thing to do is visit it and see which varieties are bearing fruit and which trees are most resistant. In this way one can gain valuable information which is far superior to any advice as to varieties which can be offered.

Almost every agent has some bonanza to offer, and which he sells at from five to ten times the ordinary price, some apple, plum, cherry or grape, which has every possible good quality and exactly fills a long felt want. But one word need be said in regard to purchasing such as this, and that is "don't." Life is too short and time too precious, to say nothing of expense, for one to start an experiment station. In almost every case one finds when the glamor has fallen away that he has some scrubby half-breed that is in every way inferior to a standard except in price. He may count himself fortunate if he finds that he has merely paid a fancy-price for a tree of some old, reliable variety.

Opinion varies as to the age at which a tree should be removed from the nursery, but, all things considered, it is better to buy yearlings, provided they have been well grown and are strong. This is especially true with apples. In the case of plums and cherries the same rule may obtain in this state.

The price varies with the age of the tree and there is little difference between the nurseries in this respect. If the buyer makes sure that he is getting standard varieties, well-grown, which are adapted to his locality, he will be safe in this particular, and the thing to avoid is paying a fabulous price for a worthless tree with a high-sounding name. Better by far to buy stock of reliable nurserymen in your own state, or locality, for then you can have some recourse should some unscrupulous agent sell you worthless trees and vines under a guarantee that the stock will be true to name.

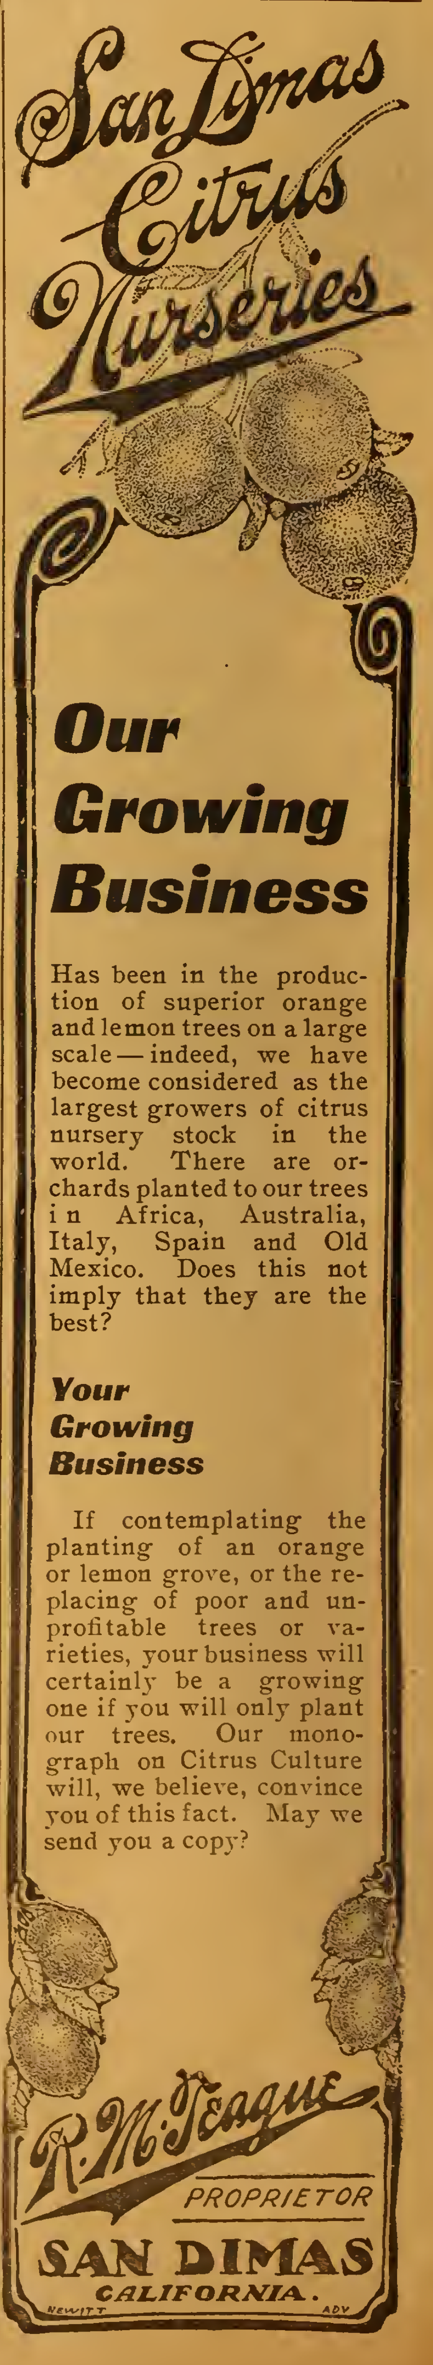
* * *

"School of Thievery."—Archbishop Keane of Clinton, Iowa created a great sensation last Sunday in a sermon delivered in that city in which he is reported as aiming a broadside at certain union laborers and labor unions, at a meeting at St. Patricks Church. He denounced as a thief the man who does not give to his employer the full measure of what he promised to give him, and declared that the labor union which upholds and encourages one of its members in a policy of this kind is nothing more or less than a "school of thievery."

Granting all the learned bishop said to be true, and it is true, he nevertheless might have gone on and included a lot of people in "high life" who are drawing enormous salaries as officers of concerns they cannot render adequate compensation for. They are thieves just as much as the day laborer who charges exhorbitant prices for his work and then soldiers away his time defrauding his employer.

It is not to be wondered at that men of fine intellectual and business character refuse to accept public office where the responsibility is so much greater than that which attaches to insurance managers, or steel or cattle trust presidents, when they see so many men of less ability, with less to do, and under lighter responsibilities, getting from three to twenty times as much. But the wrong is not in the smaller salaries but in the absolutely large ones. And they are unnecessary as well as absurd, and impose a cruel burden upon wealth producing industry, which in the ultimate pays all salaries. This high salary business has become an intolerable abuse in this country and one that obtains in no other country.

The whole country is becoming tired of the burden of paying the tariff which the consumer must pay to render the business adequate to the salaries these men receive. No wonder people are saying, "give us free trade," "our infant industries need no further protection." This high salary business has become a disgrace to the Nation. A life insurance company changes presidents, gets one at $50,000 a year in place of one at $150,000 and the new one be abler than the old. And the present salary is too high and unnecessary. If only one salary were being paid in the country it would be deemed an intolerable extortion, and the place could be better filled for $25,000. A railroad manage at $15,000 a year is made president of a life insurance company at $80,000 a year—knowing nothing about the business—and thinks he is a philanthropist because he takes the job at 25 per cent. less than his predecessor was paid. A manager in a steel mill was getting $5000 a year a few years ago, and thought himself in big luck, now he is getting $100,000 as a steel trust official, and every buyer of steel in any form is compelled to contribute toward that extra $95,000. It's an outrage and is developing socialism and its vile opposite, anarchy, faster than any other one thing.



Our Growing Business

Has been in the production of superior orange and lemon trees on a large scale—indeed, we have become considered as the largest growers of citrus nursery stock in the world. There are orchards planted to our trees in Africa, Australia, Italy, Spain and Old Mexico. Does this not imply that they are the best?

Your Growing Business

If contemplating the planting of an orange or lemon grove, or the replacing of poor and unprofitable trees or varieties, your business will certainly be a growing one if you will only plant our trees. Our monograph on Citrus Culture will, we believe, convince you of this fact. May we send you a copy?

R. M. Teague
PROPRIETOR
SAN DIMAS
CALIFORNIA.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Nothing that grows in the temperate or semi-tropical zones is out of place in California. Pineapples, even, are being cultivated in Southern California.—Oakland Enquirer.

The value of Southern California output of dried fruit for 1905 is estimated at $6,000,000. Under a good demand, the market has in all lines except raisins grown steadily firmer.

.Sheridan Harding of Wheatland, last year shipped 1200 boxes of cherries and received from $1.75 to $2 per box making his returns over $2000 for less than ten acres of cherries.

The National Orange Company through its attorneys, Purington & Adair, have brought suit against the California Citrus Union to restrain it from using orange boxes and wrappers on which is printed the words "National Orange Company."

Articles of incorporation of the New Orange Growers' Association, of Orange were filed with the County Clerk this week. Capital stock is fixed at $20,000. The organization succeeds the Independent Association, which recently dissolved.--Orange News.

Redlands shipments to January 30 were 949 cars. The Review says of the situation: 'Fifty-seven cars of oranges were shipped last week from Redlands. This brings the total for the season of 1906 to 950 cars, and is about 500 cars less than was forwarded at this time last season.

The Riverside Press of January 30, says: "Local packers are looking with interest to the showing to be made by the Salt Lake in transporting the fruit east. The eight cars secured last week will be a test, and now that the ice is broken, it is likely more will be secured right along."

Sheridan Harding of Wheatland, Yuba county, has ten acres of almonds, and he states that his average crop is eleven tons, with an average price of 12½ cents per pound, giving him as an average price per annum, $2750. He says he has not had a failure in the last eight years.

The Redlands Fruit Association is now making its payments on account of its Christmas fruit, paying for Extra Fancy $2.098 per hundred; Extra Choice, $1.808; Standard, $1.563; Culls, $.423. For their Thanksgiving pool they paid for Extra Fancy $2.24 per hundred; Extra Choice, $2.13; Standards, $2.07.—Citrograph.

California has a million more apple trees than Massachusetts, eight times as many pear trees as Maine, Massachusetts, Connecticut and New Hampshire put together; twelve times as many cherry trees as these states, and 100,000 more peach trees than Delaware, Maryland, Masachusetts, Connecticut, Maine and New Hampshire.

The San Francisco Call prints the following from Chicago, dated Jan. 23: "The juicy orange and the fig may be made the objects of a boycott by the Chicago Federation of Labor at its next meeting. Secretary Locketts received a communication from A. Hierom Shera of the California State Federation of Labor today, asking the Chicago labor organization to discriminate against all fruit packed by Japanese labor."

A writer from San Bernardino county to the "New York Sun" makes this suggestion as to the present method of shipping: "The orange industry is credited with having a higher average degree of intelligence behind it than many other similar industries, but when one investigates the diverse marketing methods and the lack of unity among the growers, grave doubts arise as to whether or not this is true. If the results of the unbusiness-like methods of the growers were visited only upon those who pursue them, it would be different, but all have to suffer to a more or less degree..

The question whether the Fresno Raisin Association will dissolve permanently is agitating its members at this time. The Hanford Sentinel says that Kearneyism seems to be an important factor in the question, as Mr. Kearney has friends enough to block any agreement, and the enemies of Kearney will have nothing to do with the business as long as it remains a factor in the situation. So it looks as though the question of a raisin combine will have to be threshed out again in the same old manner. The raisins now on hand are moving out quite rapidly now, and no doubt will be all consumed before the new crop is ready."

AGRICULTURE.

California Farmers were the first to use the combined harvesters run by a traction engine, cutting a swath forty feet wide, and threshing and sacking grain as it proceeds.

The largest watermelon was raised in Orange county, weighing 150 pounds and measuring five feet six inches in length and four feet nine inches in circumference.

All the farmers in and around Ontario and vicinity are busy in the fields of which many thousand acres are being put into grain. It is anticipated that the crop this year will be a large one.

The Standard says: "The Imperial farmers are to be congratulated, for, by a strange coincidence, at the present time, when every man in the valley is fencing his place with barb wire or planning to do so, it is cheaper than at any prior time in years.

The American Beet Sugar Company is doing some extensive tile draining on its moist lands about Chino. Some 11,000 feet of tile, mostly of six inch size, but some of four inch, has been laid, by which about 400 acres will be drained.—Chino Champion.

Three carloads of chilli peppers have been shipped from Anaheim the past week, having moved at 12 cents a pound, or $30 for a large sized sack. A local bank official has looked up the pepper sales for this season and has the estimate of those to move. He says the Anaheim crop will sell for more than $100,000.—Gazette.

J. A. Vail of the vegetable union has finished moving the crop of sweet potatoes from this section, having recently sent out eight carloads to the northern markets and a large number of cars to Los Angeles in small, daily lots. Recent shipments have brought good returns but the demand was not active several weeks ago when the local crop went in competition with potatoes from Northern California. Mr. Vail also shipped a car of squashes to Los Angeles yesterday.

California has 140 fruit and vegetable canneries, and the value of its products in this line is greater than of the twenty-four states of Ohio, Michigan, Indiana, Illinois, Wisconsin Minnesota, Iowa, Missouri, West Virginia, Virginia, North and South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Idaho, Texas, Nebraska, South Dakota, Utah, Colorado Kansas and New Mexco. —S. F. Chronicle.

A San Francisco dispatch of Jan. 30th, says: "It is asserted that a combine of millers and grocers has been organized to boost the price of flour. The Globe, American and Del Monte milling companies have issued orders to grocers raising the price of flour about sixty cents a barrel, commencing January 25. The department stores threaten to break the game by the introduction of Oregon and Washington flours and underselling the regular grocers in the combine. It is alleged that the State Grocers' Association is back of the movement to raise prices and make flour a profitable commodity instead of a staple handled on a narrow margin."

LIVE STOCK.

The new creamery at Glenn recently erected at a cost of $7,000 is to be put in operation soon.

Says the Monterey Cypress: 'Glanders has broken out among the horses at the Presidio and at present fifteen horses are afflicted.

The stockmen in parts of San Diego county are wishing for more rain. The grass is doing well, but it needs additional moisture to strengthen the roots.

John Lynch, the short horn breeder whose card appears in another column, has twenty head of young bulls and twenty-six head of bull calves for sale. These are the "milk strain" short horn and a high class lot.

Prof. Spellman of the Agricultural Department declares that it is possible to dehorn a whole breed of cattle by introducing into the herd a single pure polled animal, although this would require more inbreeding than is desirable.

The Ontario Record states a movement is on foot to raise a fund to be used in the extinction of the festive coyote. Since there has been no bounty offered for some time, for the scalps of the yellow curs, they have so increased in numbers as to be a nuisance to those of our citizens who are endeavoring to add to the number of their feathered stock.

MISCELLANEOUS.

Long Beach capitalists are figuring on building a hotel at Anaheim.

A citric acid factory is one of the proposed improvements talked for Ontario.

The Experimental Forestry Company is planting about 11,000 young Eucalyptus trees on the ranch of the company near Hanford.

A company has been formed for the making of concrete blocks for building purposes. The capital stock will be $100,000 and the headquarters at Hollister.

Fred Wells, for fifteen years editor of the Hueneme Herald of Ventura county, died of Bright's disease Saturday, January 20. He was a native of California.

Report comes from Colton that the California Portland Cement Works at that place are to be enlarged to four times the present capacity, the improvements to cost $250,000

Governor Pardee has appointed Judge Max C. Sloss of San Francisco a Justice of the Supreme Court to succeed Justice Van Dyke, deceased. His salary will be $8000 per annum.

By the payment of $27,000 principal and interest, $283.69, last Wednesday, Sonoma county wiped out the last trace of her bonded indebtedness and is able after forty years to start with a clean financial page.

Trout fishers who have Ventura county in view will please bear the fact in mind," says the Press, "that if they fish in Ventura county before May 1st they will be in danger of being haled before the courts."

The California Petroleum Refinery of San Francisco has purchased 115 acres of land near Avila, San Luis Obispo county, here it will construct a refinery and 100 cottages for employes. A million dollars will be invested.

The Sacramento Bee's special correspondent from Reno, Nev., says: "P. Beveridge Kennedy, Professor of Botany in the Nevada State University, says that escaping artificial gas is killing hundreds of valuable trees throughout the city of Reno.

The Southern Pacific Company has let a contract to build a railroad twelve miles long from Orland to Hamilton, the new sugar town that is to grow up for the sugar factory that is to be built in that section of the State.—Salinas Index.

While hunting near Santa Ana river in Ocean Park recently a sportsman shot and killed a rabowl. The animal which resembles in some respects a squirrel and has also the appearance of an owl, is a rare species of animal life and is seldom found north of Brazil.

The municipal water works of Kenosha, Wis., made $25,000 profit last year, which was so much saved to the people. Isn't it a better plan than to pay out $25,000 to swell the profits of non-resident stock holders to be spent in speculation elsewhere or in travel in Europe?—Oakland Enquirer.

The Short Line Limited is the name of the finest train in the west to be run daily between Los Angeles and San Francisco, commencing March 1. It will be run on the fastest time yet made between San Francisco and Los Angeles, leaving each terminal daily at 9 a. m. and reaching its destination at 10.30 p. m.

People who are at the Santa Fe depot in the morning, says the Hanford Sentinel, "will be convinced that the town of Corcoran is indeed on the map. Every morning there is a large number of passengers taking the train for that little town which is an example of what money and enterprise can do for a community."

Charles Wortell, a rancher and winemaker of Lincoln, is having some trouble with the Federal authorities over an old distillery plant on his place as a result of the recent visit to his ranch of a couple of internal revenue officers. He is accused of operating the distillery without a license, and the plant and a small amount of liquor has been confiscated by the Government pending a settlement of the difficulty.

Underflowing the city of Sacramento, says the Union, at a depth of nearly 200 feet, it appears, is a stream of pure, clear water, sufficient in quantity some experimenters declare to supply any reasonable demand upon it, and of a quality that makes it a most desirable and valuable acquisition. For centuries, probably, it has filtered through the gravel beds that serve as a foundation for the city, and while experiments have from time to time demonstrated that such a condition prevailed, the test of its practical and commercial worth has not been made until very recently.

The increased production of fuel oil in California has dealt a severe blow to the coal miners of the Coast region, according to a report just issued by the Geological Survey. "This oil boom has affected the production of lignite in California and Oregon," says the report, "as well as the production of bituminous coals in Washington, in much the same way as the production of Texas oil has affected the coal mining industry of Arkansas and Indian Territory. So serious has this competition become that the Coos Bay mines in Oregon may be closed down at an early date."

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

MILKING THE COW.

Things for Milkers to Think about—Too many milkers regard the work of milking as a dirty, disagreeable task. The work has resolved itself into nothing more than the manipulation of the udder, and is to be hurried through with as quickly as possible. The element that takes from all drudgery its unpleasantness is wanting. That element is thinking along lines tending to improve the work. In the processes that attend the milking of a cow there is enough to cause the milker to study seriously the work that leads up to the making of a perfect pound of butter. Milk as it is drawn from the udder is nearly free from bacteria. Could it be kept in this condition it would keep for many hours before any perceptible change would take place.

The first bacteria enter during the time of milking and are naturally from the cow and her surroundings. The manipulation of the udder works off hair, particles of skin, and in many instances particles of manure that adhere to the hair and udder. All of this material finds its way into the milk pail and carries with it great numbers of bacteria. The warm temperature and the presence of a congenial food supply that is in just the right physical condition cause these bacteria to multiply very rapidly, and unless something is done to check their growth souring or other evidence of decomposition will take place in a very few hours. The rapidity with which these changes occur will depend almost entirely upon the temperature at which the milk is allowed to stand and the number of bacteria that find entrance to it. These facts are constantly in the mind of the careful dairyman. He knows that the first step is prevention. The work of milking should be performed in such a way that few bacteria will find their way into the milk. The milk should be cooled quickly and thoroughly immediately after it is drawn in order to check the growth of those bacteria that will, under the best conditions, find their way into it.

* * *

A bunch of Porkers six months old fattened on alfalfa at Corcoran, Kings County

Cleaning the Cow.—All this leads to the conclusion that the cow must be carefully cleaned. This is as good for her general physical well-being as for the protection and purity of the milk. The card or the currycomb thoroughly but gently applied will remove all coarse dirt, straw, or other matter clinging to the animal that would eventually find its way into the pail. Aside from carefully cleaning the cow with the card or the currycomb, the parts immediately surrounding the udder and the udder itself should be wiped with a damp cloth. This had best be done just before the milking begins, as it will remove most of the dust which may still remain after carding and dampen that which is not removed, so that it will not fall into the milk pail. If the milking is to be done in the barn there are some other important things that need attention. The air in the milking place must be free from dust—it matters not whether the dust comes from the floor as a result of its recent cleaning, or whether the animals have stirred up the dust in coming into the stalls, or whether it is caused by the distribution of feed in the racks and boxes. Dust in the air will find its way into the milk, bringing with it great numbers of bacteria. If the floors are dusty they should be lightly sprinkled, so as to prevent the stirring of the dust. Feed should not be distributed just before or during the milking hour.

* * *

Clean Milkers.—Another thing of importance in connection with milking is the condition of the hands and clothes of the milker. He should be clean personally, and should be required to go about his work in clean clothes. The milking should be done with dry hands. The habit of some milkers of wetting their hands with milk just as they begin is a filthy practice and the cause of much bad milk and poor butter. There is something in the presence of a milker in a white suit that calls for clean work, particularly if he is required to keep the suit clean while about his work. For this reason, as well as for the esthetic effect, many dairymen require their milkers to be dressed in white. The same principle is true in regard to whitewash on the interior of the barn. A carefully whitewashed wall shows off cobwebs to their advantage, and they will usually be removed. There is something out of place if part of a building is kept clean and fresh—as a whitewashed wall, for instance—and other parts are a mire of filth. Whitewashed walls go with clean floors, and the two with a white-clad milker will usually insure clean milk.

CARE OF CREAM ON THE FARM

In a recent bulletin of the Wisconsin Station No. 129 discussing a number of creamery problems. E. H. Farrington makes some statements regarding the care of cream on the farm which are of special interest "to the creamery operator and dairy farmer in sections where farm separators have been introducel for separating the cream from the milk. Attention is called to the fact that these machines are now comparatively new to many farmers, and the change from daily delivery of whole milk to sending cream once or twice a week has made considerable difference in in the methods of handling the milk and cream at the farms.

"The problem of caring for the cream so that it may be delivered to the creamery in good condition is a serious one, because it has an important bearing on the quality of the butter. In many cases butter made from cream not properly cared for does not sell for the top market price, and since there is a growing tendency to sell butter on its merits, giving only the price its quality deserves, there will be difficulty in disposing of butter made from a poorer quality of farm separator cream at prices equal to those of butter made at whole-milk creameries. Considering the question, however, from the mechanical side of the butter-making process alone, there is no good reason why farm separator cream should not be equal to, if not better than, that separated at a factory with power separators.

When milk is separated at the farm immediately after milking, the cleanest and sweetest cream possible ought to be obtained; it certainly should be better than that skimmed by a factory separator from milk which is 2 to 20 hours old, and on this account a better butter should be made from the farm separator cream.

The usual causes of defective butter from gathered cream are: First, unsuitable places for keeping the cream, and, second, holding the cream too long before it is collected by the cream gatherers. A perfectly clean, sweet, and satisfactory cream is produced on many farms in the State and delivered in good condition to either a retailer, an ice-cream maker or a creamery. There are, however, places where tainted and defective cream is found, and in some cases it is being mixed with cream of a better grade. This is hardly fair to the producer of first-grade cream, and in order to raise the standard of the entire product to a grade equal to the best the following suggestions are offered as a guide to persons not familiar with proper methods of caring for cream:

(1) Place the separator on a firm foundation in a clean, well-ventilated room where it is free from all offensive odors.

(2) Thoroughly clean the separator after each skimming. The bowl should be taken apart and washed, together with all the tinware, every time the separator is used. If allowed to stand for even one hour without cleaning there is danger of contaminating the next lot of cream from the sour bowl. This applies to all kinds of cream separators.

(3) Wash the separator bowl and all tinware with cold water and then with warm water, using a brush to polish the surface and clean out the seams and cracks; finally scald with boiling water, leaving the parts of the bowl and tinware to dry in some place where they will be protected from dust. Do not wipe the bowl and tinware with a cloth or drying towel; heat them so hot with steam or boiling water that wiping is unnecessary.

(4) Rinse the milk-receiving can and separator bowl with a quart or two of hot water just before running milk into the separator.

(5) Cool the cream as it comes from the separator or immediately after to a temperature near 50 degrese F., and keep it cool until delivered.

(6) Never mix warm and cold cream or sweet and slightly tainted cream.

(7) Provide a covered and clean water tank for holding the cream cans

DE LAVAL DAIRY SUPPLY CO.
9 and 11 Drumm St., San Francisco 107 First St., Portland 112 2nd Ave. South, Seattle

and change the water frequently in the tank so that the temperature does not rise above 60 degrees F. A satisfactory arrangement may be made by allowing running water to flow through the cream tank to the stock-watering tank.

(8) Skim the milk immediately after each milking, as it is more work to save the milk and separate once a day and less satisfactory than skimming while the milk is warm, since the milk must be heated again when saved until another milking.

(9) A rich cream testing 35 per cent fat or more is the most satisfactory to both farmer and factory. The best separators will skim a rich cream as efficiently as a thin cream and more skim milk is left on the farm when a rich cream is sold.

(10) Cream should be perfectly sweet, containing no lumps or clots when sampled and delivered to the haulers or parties buying it.

There is a good demand for sweet cream and it can easily be supplied by keeping the separator, tinware, strainer cloth, and water tank clean, and the cream cold. The preceding recommendations when followed will pay well for what some may think is "a lot of extra bother."

BUTTER MAKING ON THE FARM.

Edwin H. Webster, chief of dairy division, Bureau of Animal Industry has prepared a bulletin, No. 241, on the various phases of making butter. He goes into the subject exhaustively and the suggestions made are of exceeding value to dairymen all over the country. Of course the reference made to climatic conditions existing in the middle west is not applicable to California, for we have no moist, sultry weather to spoil our cream, as is the case there during dog days, but we have nevertheless, other impediments to dairying which the bulletin referred to offers reasonable solution. A portion of the bulletin is here given:

Causes of Changes in Milk.—Everyone is familiar with the changes that often take place in milk, and those which occur in the spoiling of fresh meats and vegetables, though the causes that produce these changes may not be apparent to the observer. It is also a matter of common experience that in hot, moist, weather these changes take place with much greater rapidity than in cold or dry weather. Everyone who has handled milk has learned that cleanliness in everything that comes in contact with it is one of the essential factors to success. Cold storage, such as may be supplied by the common household refrigerator, is also necessary for the keeping of milk and other perishable products in hot weather.

The cause of the spoiling of fruit, vegetables, meats and milk was found to be minute plant life, or germs, called bacteria. It was discovered that these minute forms of life—so small that it takes a powerful magnifying glass to see them—were the cause of all decomposition. A study of their life, habits of growth, the food on which they lived, the kind of substance on which they could develop, and the temperatures most favorable to their growth revealed the scientific necessity for observing perfect cleanliness in all dairy utensils and for keeping the milk cold. It was found that bacterial life is in evidence everywhere, and only awaits the proper food, moisture, and warmth to cause the bacteria to multiply very rapidly. Just as a grain of corn grows when given proper moisture and warmth, so the germ life that finds its way into milk utilizes the food and warmth found there to grow and multiply, causing decomposition.

It has been found that when milk or other perishable foods are kept free from bacteria they will not spoil; and, further, that foods of this nature when kept at low temperatures are very much longer in spoiling, altho' they may contain great numbers of germs. When milk and other products are heated to a high temperature the bacterial life is destroyed, and the products will keep for a long time if no additional bacteria gain access to them.

The application of this knowledge forms the greater part of the science of butter-making. The great amount of poor butter made on the farm indicates that some or all of these facts have either been misunderstood or ignored. Fortunately many species of bacteria known to exist are not harmful in milk. Many are beneficial in that they develop flavors desirable in good butter. From this it appears that the knowledge of methods necessary to check or destroy bacterial development is but a part of the butter maker's art. He must know how to promote the growth of the desirable kinds. Up to the point of ripening the cream the whole process is one of retarding the development of bacteria by cleanly methods and the use of cooling devices. When the ripening process begins the growth of favorable kinds is encouraged.

FEEDING COWS.

Editor Cultivator:—I am feeding a bunch of milk cows exclusively on alfalfa hay. In an adjoining yard we have some that we are feeding on corn fodder. Whenever the corn fodder cows are being fed the alfalfa fed cows show a great anxiety to get at the fodder, and when they get a chance to get into the yard they eat up the corn stalks the other cows leave. Is not alfalfa, fed exclusively, too hard on their kidneys? Would it not be better to feed some other feed in connection with it? Would not the butter results be better?—P. B. D., Bakersfield.

We have never heard of any bad results from feeding milk cows all the alfalfa hay they will eat. It might be best, however, to furnish your cows some roughage in the form of wheat or barley hay. If they eat it up clean and all the alfalfa you give them as well, I would conclude that you are not supplying them with all the feed that they need. With very heavy milkers you will find it necessary to feed some grain to get the best results even when alfalfa hay is fed for roughage. I would suggest that you feed a grain ration of two-thirds corn and one third bran to your heaviest milkers, and note whether they give you an increased flow of milk. The per cent of butter-fat in the milk of your cows will be varied by the kind of feed given. The only way to increase the butter product is to increase the quantity of milk given.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

THE FERTILITY OF EGGS.

I know of nothing much more discouraging than to fill an incubator full of eggs, and after a week on testing them to discover a large number to be infertile. This is just the season for these unhappy discoveries and a talk on the causes of infertility may be not only seasonable but helpful.

Perhaps by interrogating Nature we may be greatly assisted in our search for the causes. Wild fowls' eggs are rarely infertile and therefore many say as wild fowl only mate in pairs as a rule, that in our poultry yards we are mating too many females to one male, that is doubtless one cause especially with the heavier breeds. The rule is to mate four to eight females of the Asiatic breeds to one male, from eight to ten of the American breeds, and twelve to fifteen females of the Mediterranean breeds to one male. This is a fairly good rule, but much depends upon the vigor and the age of the birds, the weight and size also of the male. As a rule the male should not be above the weight given in the Standard for this breed nor should the female be below the standard weight.

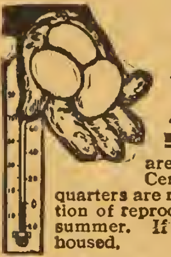
But to return to Nature, the time when the wild birds all mate is in the spring and early summer, then the wild geese and ducks return to their breeding grounds and all nature is growing and producing. It will be found that in our poultry yards March April and May are the months when fertility is the highest. To have fertile eggs in our yards we must as far as possible copy the conditions of springtime, with the food that Nature then supplies. Much, very much, depends upon the food, the "balanced" ration. We must balance it for fertility Let us interrogate Nature! Where are the grains in the spring? They are gone, they have fallen onto or into the ground and are sprouting and growing and there is a plentiful supply of tender green, the insect life too, begins to pulsate, the grubs are pushing their way to the surface and worms (animal food as we call it) are abundant. Let us copy nature, feed more green food and animal food and less grain and we shall have greater fertility.

You all know my rules for egg production. I sometimes wonder if you do not get tired of my repeating them! The three essentials of egg production are comfort—exercise—proper food. These three are also essential to fertility. One of the many causes of infertility is lice. The body lice deposit their eggs chiefly on the feathers at the vent and when they are abundant prevent fertility. Lack of exercise is another and most serious cause of infertility. If the fowls are confined in breeding yards they must be provided with a good scratching pen filled with straw or hay from six to twelve inches deep, the hay must be kept deep, it requires more to be added at least once a week and should be cleaned out and renewed whenever it becomes dirty.

Exercise develops the egg producing organs and keeps them in a vigorous and reproductive condition in both sexes. Fertility demands vigor and vigor results from exercise. Lack of vigor on one side or the other is undoubtedly the chief cause of infertility, and this is usually the case on the side of the male bird. I will give some of my own experiences in this matter, some of them were sad.

* * *

I had read in poultry magazines (one frequently finds ridiculous statements in some of them) that when the eggs were not wanted for hatching the males should be removed from the pen, especially at moulting season, and allowed to rest, for constant use in the breeding pen was very exhausting let the male bird have several months of rest was orders of a number of books, I tried it. I took one of my best prize birds away from his harem put him alone, poor fellow! He fretted at the absence of all his beautiful wives, but in time became partially reconciled to the inevitable and after a few months I replaced him, re-mated him. He was a perfect picture of health and of beauty and I anticipated a good season of fertility for I had closely followed the poultry magazines directions but not a fertile egg was to be found. I then mated him to two pullets only, with not much better results and to my grief I found that if the male birds have been mated and are taken entirely away from the hens the organs of reproduction become from disuse so useless that it takes several months to restore their activity, and in the case of two year old (or older) mates they frequently become so atrophied that they never recover. What does Nature teach us? Dr. Salmon in his valuable books on the diseases of poultry informs us that with wild fowls the organs of re-



EGGS
ALL WINTER

are not a Possibility, but a Certainty if your FEED and quarters are right. It is simply a question of reproducing the natural feed of summer. If your hens are properly housed,

Purina Poultry Feeds

will do the rest They're a Practically Tested combination of perfect, fully ripened grains and seeds, sweet, tender Alfalfa tops and leaves and untainted Lean Meat, dried while fresh—all the BEST that can be procured. No grit, no condiments, no dopes.

Because immature, smutty or musty grain, or tainted meat, has the same effect on your fowls that green apples or musty food has on a child. The health of the fowl is impaired, and then the EGGS DON'T COME.

But don't take OUR WORD for this—prove our claims on YOUR hens at OUR EXPENSE with Purina Poultry Feeds, and SEE THE 40c EGGS COME.

Then if RESULTS don't come, just tie up the bag and write us, and we'll return every penny of your money, and tell you what to do with the unused feed. You are not out a cent in making the trial, for we supply you through your dealer or direct, FREIGHT PAID, and the Feed used in testing will cost you nothing.

WHY HENS DON'T LAY

When well cared for and well fed, is because they need waking up to start egg production. This comes naturally in the spring—the natural mating season. In winter you have to give something to stimulate them. Without this they are stupid, lazy and dull.

Mix **SECURITY POULTRY FOOD** in their rations. It will give them life and activity and shortly your hens will be laying. Don't wonder why they don't lay, but get Security Poultry Food from our dealer in your town and feed it.

WE WILL REFUND YOUR MONEY
if you are not entirely satisfied.

production "become very small in the winter with a comparatively insignificant blood supply, but in spring, as the breeding season comes on, they enlarge to five or ten times the weight are distended with blood and the height of functional activity is reached." With the wild birds the spring is the time of mating and we must try to supply the conditions of spring time in order to have fertile eggs.

When I wish to remove the male bird from a pen I always allow him two hens to share his seclusion, it keeps him happy and contented and whilst giving him a partial rest will not result in sterility or an atrophied condition. On the female side undoubtedly infertility in the eggs often comes from a too fat condition, the hen has been not fed too much, but a too fattening ration, not enough protein and green food; too much grain.

* * *

Some breeds fatten more quickly than others, especially the breeds that make good table fowl, these require more exercise than their more active and lighter cousins of the Mediterranean class. You can read in poultry magazines that infertility comes from our hens laying a much larger number of eggs than Nature intended, this is one of the ridiculous assertions to be found in print which are absolutely incorrect.

I had one hen that laid 225 eggs in exactly nine months. I kept her till she was nearly seven years old, every egg she laid was fertile. I had another hen I kept for three years, a beautiful hen, she never laid a fertile egg, although I changed her mate several times.

With one exception my highest scoring hens were my best layers, and the eggs of my best layers were the most fertile. Another cause for infertility and also of weak chicks from the same is the males are some of them so gallant that they call up their wives to eat and these take the best of the food (usually the most of the protein) and without one realizing it the male bird becomes thin and weak therefore I always feed the males during breeding times extra. I will shortly give an article on mating and breeding which will include this matter.

FEEDING FOR WINTER EGGS.

If those who keep fowls for winter eggs will provide comfortable, clean houses and feed their fowls on the kind of food that will furnish the component parts of the eggs the egg production will go on, and as fast as the yolk is formed it will separate itself from the ovary and pass into the oviduct to be covered with the white and the shell. This process depends entirely upon the formation of the yolk; until this is formed no egg can be furnished by the hen. As soon as the yolk passes into the oviduct the process of completion begins. This can be finished in from five to six hours, or it may take from twelve to twenty, according to the activity of the hen and the presence or absence of the proper material to do the work.

The number of eggs thus laid depends on the number of yolks the ovary will furnish. There are hundreds of these small, incomplete ova which will be complete as fast as nature can do the work with the material at hand. When deprived of that manner of food necessary for the growth of the yolk the work must stop.

Another fact for consideration is that the yolk or ovum becomes fertilized very soon after it leaves the ovary or just as soon as it enters the oviduct. As soon as the process of covering the yolk begins, contact of of fertilization is impossible. When the process of making the egg goes quickly on, as is necessary with the larger egg yield, there is but little time for the yolk to be fertilized, as it passes so quickly from its encasement in the ovary into the oviduct, where the process of finishing is done. For these reasons the chances are better for a larger per cent hatch from the hen that lays the fewer eggs.

To aid the poor fertility side of the question, we have the more sluggish condition that is natural to all fowls and birds following the season of moult and migration. Fowls of all kinds lose strength, courage and vigor during moult or the fall season. This same influence counts against the fertility of the winter egg yield.—Dairy and Produce Review.

Poultry and Eggs Wanted

This sign you will see hanging outside of a merchant's store in nearly every town on the coast and it, in a measure, must convince you that there is money in the poultry business, and the

Chatham Incubators

will assist you in making money. Any responsible person can get a genuine **Chatham** and have SIX MONTHS TO PAY FOR IT—what is the use of you paying out money for an Incubator when you can make it pay over and over again for itself?

I can give you hundreds of testimonials from customers all over the Coast who purchased Chatham Incubators and Brooders last season on our **ON TIME PLAN**, and are thoroughly satisfied with them. The manufacturers fully guarantee every machine. Write me for our catalogue and some useful hints on poultry raising—it will be mailed to you free.

Geo. W. Foott, Box 2040, Portland, Ore.

THE ENGLISH RUNT.

It may seem strange to the general public to learn that the largest pigeon in the world is called the Runt, but nevertheless the English Runt is the giant of the lofts. To the superficial observer it appears to be only a large pigeon of ordinary dove shaped stamp, but it has as now bred and shown many features quite as distinct as that of size. Size, not weight is its chief point. The Runt should not measure less than 20 inches from tip of beak to tip of tail, while a first class show bird should measure 22 inches.

The Pigeon Standard says: "The Runt should not measure less than 20 inches from tip of beak to end of tail, a long narrow bird is most objectionable. Width and compass of girth must be accompanying points; a Runt 20 inches long should measure in girth around the upper part of the body, at least 14 inches. Wings, when stretched out to their full limit should measure from tip to tip not less than 36 inches. Head of a very massive dove-shaped character, with a thick beak of proportionate length rather downward in tendency. Wattle almond-shaped and though full, not rough in texture. Eye fine and plum-colored, showing a healthy whitish bloom, somewhat sunk in the head, the iris should be either silver or golden red; neck medium length, well cut away at the throat, no display of anything tending to a gullet wide, but not too prominent; chest is a great feature of excellence; Back broad rather "hog" shaped at the upper part but very at as it approaches the rump. Legs rather short than long in proportion to the size of the bird and widely set apart. Carriage upright, not horizontal or boaty. Colors, black, red, mealie, chequer, blue and silver. The Runt is not a very rapid breeder, rarely ever getting over four pair of young in a season and is therefore not of great value as squab-breeders for the market if bred pure, but when bred with the Maltese hen pigeon and cross taken, and bred together, few birds can excel them for the production of numbers and none can compare with them for size. In crossing the Runt with the Maltese hen I would advise the use of the Runt cock and the hen if large numbers of the crosses are desired, on account of the laying quality of the hen pigeon. On the other hand according to the hen having a great bearing on the size of the young if speed is not cared for the opposite cross will probably give a trifle larger squab, recrossing the opposite crosses for general loft breeding for market gets a good even sized squab near fifteen pounds per dozen at four weeks old.—W. E. Foster.

REARING INCUBATOR CHICKS BY BROODY HENS.

A hen to which incubator chicks are to be given should be free from lice and in a nest where other hens can not disturb her. In the evening two or three chicks, at least thirty-six hours old, may be placed under her from behind, care being taken not to excite her, lest she step on them. At least one chick of each color should be given her, for hens are apt to kill chickens of another breed, color, or size than those they have already adopted. The following morning she may be expected to mother as many as are given her.

"The first week is the most critical period in the life of the chick. Trouble is the most likely to be caused by chills." Coops should be used which do not permit the chickens during this period to get away from the mother. Later they should be removed to a slat coop which allows them free range. It is not advisable, however, to allow the hen free range for at least two weeks. If she is kept confined and fed coarse grains, while the chicks are being fed a few yards away on finer grains, she will soon forget to call them and probably they will not return to the hen, but wander away and be lost, or chilled to say the least.—Neb. Station Report, 1905.

BROODING HENS.

Almost any broody hen can be made to sit if carefully handled. She should not be carried by the legs with her head hanging down, but with her breast resting in the palm of the hand. Transfer should be made at night, and the nest into which she is put kept dark for twenty-four or thirty-six hours. The hen should be kept free from lice.

GUINEA FOWL FOR THE TABLE

From "a time wherein the memory of man runneth into the contrary," on every well-regulated, well-kept farm in this county says the Denver News, there could be found a pair or more of modest guinea fowls. During this period had the farmers been asked why this feathered biped was fed and cared for they would have been at a loss for an answer. The guinea fowl is beautiful in neither form nor plumage. Its eggs are small, speckled and of a dirty yellow color. Yet, after all these years, during which a kindly fate, with the aid of the farmer, has succeeded in perpetuating the species, the guinea fowl, through the aid of the United States Department of Agriculture bids fair to come into its own.

On the ears of the American people obliged to pay 25 cents a pound for their turkeys, the intelligence concerning the guinea fowl sent out by the Agricultural Department will fall as glad tidings. For, says the department the guinea fowl is a most excellent table bird. "The birds do well with comparatively little care," the report says. "In spite of the half-wild habits which they retain when allowed to range, they may be trained to more domestic ways and readily fed and fattened like other poultry. They are exceptionally hardy. Their noisy and quarrelsome habits are commonly thought to give warning of hawks or other intruders in the poultry yard. Guineas eat such large numbers of insects that they are often useful in helping to destroy these pests. They also eat many wild seeds, and in this way are of value. There is already a fair demand for guinea fowl, especially in New York and other cities in the Eastern United States. Very young birds for broilers bring good prices early in the season in city markets, while the older ones are easily sold throughout the autumn and winter. They may be prepared for the table like ordinary fowl or like game birds, and have very much the same food value as chicken and are as economical when bought at about the same price per pound. At moderate prices they furnish the body with about as much nourishment for a given sum as medium cuts of beef and mutton, and at higher prices correspond in value with the more expensive cuts, and such poultry as turkey, green goose, etc."

Now that the bird has received the commendation of the Department of Agriculture as an article of diet, it may be expected to increase both in numbers and in price, if not in value.

A TYPICAL FOWL.

The Blue Andalusians are fast coming to the front as one of the most beautiful of our feathered tribe and the greatest egg producers. The egg being large and of an exquisitely delicate flavor, weighing from two to three ounces to the dozen more than the Leghorn or Minorca.

Coming from a warm climate this breed is not adapted to localities where the winters are long and severe but seem to thrive well on the Pacific Coast. They do not need much range and can be kept in close confinement better than any other breed. The Andalusian must be considered a truly useful and handsome fowl and appears each year to increase the number of its admirers.

They make a good table fowl and the young chicks feather fast and are hardy. Eastern fanciers are looking to California for fancy stock especially in the Mediterranean class, several large shipments having been made to Eastern cities in the last few months, Blue Andalusians, Black Minorcas and Brown Leghorns being in the lead.

The farmers should certainly be interested in this breed of fowl as the perfect marking can always command fancy prices while the off-color hens being as equally good layers would supply the market demand. They mature early being known to lay at four months, non-sitters, a good all-round chicken and a typical American bird having our three National Colors. The red comb, eyes and wattles, white earlobes and blue plumage.
—Mrs. T. R. Griffith.

EGG FOOD A·C·W IT FILLS THE BILL

Stop and Think

If you would have an **Egg Food** that runs **100 lbs.** per sack or one that runs less:—you would say naturally that 100 lbs. of material in the sack must be better goods than 80 or 90 lbs. per sack; because in order to get 100 lbs. in the sack we screen all the **Chaff, Waste** or bulky material from the goods, and you get a heavy food—you use less and your hens do better—not feeding them bulky, indigestible ground straw or trash that should not be there in the first place.
Compare our A. C. W. foods with others yourself—note the difference—then ask your hens their opinion by feeding them A. C. W. food and get their answer—**more eggs.**

OFFICE OF
Must Hatch Incubator Co.
(INCORPORATED)
A. E. Bourke, Pres. Phone Black 1211

PETALUMA, CAL., JAN. 1, 1906.
TO WHOM IT MAY CONCERN;

As the chicken raising season is at hand, we beg leave to call your attention to a few of our specialties.
Do you need an Incubator? Our machines are fully guaranteed and have proven themselves unsurpassed wherever used.
Do you need Brooders? We manufacture just what you want; fully guaranteed, made of the finest material and of the best possible workmanship, and, above all, a practical machine which saves the purchaser money, time and labor.
Do you need Poultry Supplies of any kind? We manufacture a line of Supplies the use of which makes Poultry Raising not only profitable, but a pleasure. Among our specialties are:
Our Water Fountains; our Self Feeder for Chicks, our Feed Troughs, large and small; our Lamp Fillers.
Our convenient Must Hatch Nest Boxes; our safe and sure Must Hatch Insecticide, our sanitary Must Hatch Disinfectant, our sure death Must Hatch Lice Exterminator, our Poultry Compound, a fine Spring and Fall Tonic.
In connection with the above list, all of our own manufacture, we can also furnish the following, which are indispensable to the Poultrymen:
The No. 128 Clover Cutter, the Enterprise Bone Mill, the Ohio Feed Cutter, the Banner Root Cutter, the Enterprise Feed Chopper, the Ideal Duplex Feed Mill, and the Farmer's Boiler.
Do you wish to make your own Incubator or Brooder? We can furnish you all the necessary parts for making an Incubator or Brooder, also plans for the best and most practical Poultry Houses.
Did you ever purchase Just Hatched Chicks? We have a Hatchery of 50,000 chicks per month capacity in operation the year round and have, for the past few years, been successfully shipping, in our specially constructed carriers, just hatched Chicks, to distances as great as 2,000 miles. If you need them, book your order early, as our future delivery list is rapidly filling up.
We can also supply White Leghorn hatching egg in quantities desired. If you have not already received our catalogue, write for Catalogue B, and you will find therein a more detailed description with prices, etc., of the above.
Hoping to hear from you in the near future, we are,
Yours Very Respectfully,
MUST HATCH INCUBATOR CO.

WESTERN GAS ENGINE CO. INSTALLS SUCCESSFUL PUMPING PLANT AT ANAHEIM.

The Anaheim Union Water Company have reason to congratulate themselves on the splendid results obtained from the installation of their new pumping engine built by the Western Gas Engine Company of Los Angeles. Some months ago, when it was decided to increase the water supply, the Directors made an exhaustive study of the matter, visiting a number of the most important pumping stations in Southern California, in order to thoroughly determine the relative advantages of both gasoline and electric power, and after careful inspection, together with competent power experts, the conclusion was reached that gasoline would furnish altogether the cheapest and most desirable power for the proposed plant.

Bids were called for specifying a modern gasoline engine of 60-horse power. Among the six bids received was one from the Western Gas Engine Company, this bid was not the lowest, but after a comparison of the merits of the different makes, it was accepted, as the Western Engine was decidedly superior in numerous points.

The engine together with a Byron Jackson No. 10, Special Centrifugal Pump was installed early in August but owing to the fact that the pump had not been sunk low enough, the water furnished was somewhat short of the desired amount. The pump was accordingly lowered fifteen feet, and on November 6th a test was made. The results proved the wisdom of the choice of the water committee, for the plant averaged over 400 miners inches of water from the start, with a lift of forty feet. The run was made for ten hours, and continued each day for some little time to test the regularity of the flow and the smooth running qualities of the engine. In every particular results were most satisfactory, and not a fault has developed to detract from the exceptionally creditable showing made. A stream of water four feet across and nine inches deep is being pumped, and the water question is settled in a most gratifying way for some time to come. The engine uses No. 2 distillate for fuel, consuming five and a quarter gallons per hour at a total cost of twenty-nine cents, thus making this plant one of the most economically operated in the entire southern part of the State.

Engine During Installation

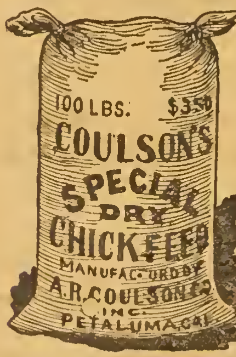
The Western Gas Engine Company has secured a number of other important contracts within the past few months, indicating that the superior merits of their engines are rapidly forcing them into first place in this line. Among these are nine engines for use at the plant of the New York Engineering Co., where the government's reclamation project, above Yuma, Arizona, is being carried out; a 50-horse power size at Fayette, Idaho, for use at the city water works; two 60-horse power size at the Huntington Beach Company's electric light and water plant; one 50-horse power at Monrovia's water plant and a number of others; all of which have excited the admiration of their owners and experts have proven their claim to superiority by the manner in which they have exceeded every claim made in advance.

\$500! What About It!

Look for a Little Envelope in the 100 lb. Sacks of

Coulson's Special Dry Chick Feed

For Little Chicks and Turkeys



You will have the best success you ever had in raising chickens if you will feed COULSON'S SPECIAL DRY CHICK FEED. Send for sample. Its good for turkeys as well.

This Chick Feed is composed of small pieces of cracked grains, also a variety of seeds and small pieces of charcoal, meat and bone. It therefore contains a variety of the best and most wholesome ingredients in the right proportions to promote the growth of chicks and turkeys and fully nourish them so they will reach maturity early, and be vigorous, strong, healthy birds.

ECONOMY IN USING COULSON'S SPECIAL CHICK FOOD.

By a series of tests it is found that chicks will gain weight much quicker on COULSON'S CHICK FOOD, AND at less cost than those fed on grain.

Chicks fed on COULSON'S CHICK FOOD will reach the weight of two pounds a month sooner than those fed on grains, and they will reach the average weight of three pounds eight weeks sooner.

With COULSON'S SPECIAL CHICK FOOD and COULSON'S GROWING CHICK FOOD many succeed in raising from 95 per cent to 98 per cent of the chicks hatched and you can do as well. TRY IT THIS YEAR.

Mr. Poultryman, there is only one way to buy, and that is, on record of what you want. If you want to raise lots of nice chicks, buy good feed.

I think your Chick Feed in fine. I never lost one while I fed it. and never saw chicks grow so fast in my life.
MRS. HATTIE DEAN.
Mesa, Washington.

COPIES OF LETTERS RECEIVED.

I like your Special Chick Food better than anything I have ever used.
MRS. GEO. THISSELL, Jr.,
Winters, Cal.

\$500. What about it?

I have used your Special Chick Food since last March, and am still using it. I believe it to be all right. I have lost less chicks than other years. It is good—the best I ever bought.
R. A. WHITFORD.

I have used your Special Dry Chick Food and recommend it to all my neighbors.
MRS. IDA L. PARKER,
Eureka, Cal.

Our chicks are doing splendidly on the Special Chick Food. No losses except by accident.
J. HUNTER.

COULSON'S FOODS GIVE BEST RESULTS.

I am a user of Coulson's Chick Food and have raised 1100 chicks this winter. The first hatch I used some other food and lost over sixty. My second I raised on COULSON'S CHICK FOOD. according to directions, and lost only ten. Then in my third hatch I fed COULSON'S CHICK FEED—dry—three times a day for three weeks and out of 394 chicks, I lost only two, and all are doing fine. Now, chicken raisers in this locality are wondering at my success, and I am praising COULSON'S FOOD as much as I know how. (Signed) F. E. HEUSEL,
Half-Moon Bay, Cal.

COULSON'S CHICK FOOD.

Contains ingredients that long experience in poultry raising has found best adapted to give nourishment to growing chicks. It is promptly digested; causes no indigestion: keeps bowels in normal condition. Chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first five or six weeks. Save your chicks and make good profits.

Keep them from bowel trouble and all ailments incident to the first five weeks. Profit lies in the chicks you raise to maturity—not in the number hatched. Give them a ration that makes healthy, well developed bodies

Remember Mr. Basset sold broilers only six weeks old for \$3.75 a dozen. They were fed on Coulson's Chick Food.

BEGINNING LIFE ON COULSON'S CHICK FOOD

TEN WEEKS OLD CHICKS RAISED ON COULSCN'S CHICK FOOD

\$500

It's Great Food to Make Chicks Grow

\$500

Send me another sack of Coulson's Chick Feed. It seems to be just the thing for young chicks, they are doing fine.—H. A. DUN, Tacoma, Wash.

Germain Seed Co., Southern Distributing Agents, 326-330 South Main Street, Los Angeles. Cal.

Queries and Replies

CORELESS APPLES AGAIN.

Is there any virtue in the seedless apple about which so much has been printed. Is it really worth purchasing for a city lot or home orchard.—J. E. K., Los Angeles.

The seedless and coreless apple propaganda continues to be cleverly manipulated and exploited before the people by the promoters of this money making scheme which has been denounced by scores of writers and horticultural authorities as an unmitigated fraud and fake. That there is a practical seedless apple is not denied. But, as a practical commercial fruit the seedless and coreless apple is nil. The fruit experts of the Department of Agriculture have denounced it as a fake, and the promoters can point to no single authority to uphold their claims, yet the promotion work goes merrily on; companies are formed, and literature distributed showing that this is the most wonderful horticultural discovery or evolution of age.

Many papers, and even scientific journals, have been "roped in" and have published articles especially written for them by propagandists themselves, and these papers are now being quoted in the printed literature distributed by the company. The agricultural journals of America have about stopped publishing accounts of this wonderful (?) discovery, but the daily press continues its free advertisements every now and then.

Seedless apples are quite common and have been so for many centuries; the Cultivator has received several lots from various localities in the past year. A seedless apple is of no more value than the most "seedy" one.

WORMS IN PIGS.

Editor Cultivator:—I have a bunch of pigs four months old that are wormy. They do not have much appetite, but droop around and are weak. What shall I do? J. C. G., Escondido.

Give each pig a spoonful of turpentine in milk morning and night for three days, then mix wood ashes or powdered charcoal in dry bran and feed for a week. Give milk as usual.

GRAIN FOR HOG FATTENING.

A subscriber asks what is the best grain to grow for fattening hogs. Proffessor Wickson answers a similar question by saying: "Experience seems to show that probably the best grains to grow for fattening hogs are barley and Egyptian corn, or Kaffir corn, both of which are varieties of sorghum, making a large starchy grain. There are only a few places in California where Indian corn grows well; consequently the other grains which we have mentioned are used as a substitute, and, in connection with alfalfa, make a splendid ration for hog feeding.

BERMUDA GRASS.

Editor Cultivator.—Although a pest, Bermuda grass is said to be a good pasture grass in some sections. Can you give us an article on the subject?—H. D. W,. Santee.

Along the Sacramento river and other parts of the State, where we have large bodies of overflow lands, much of which is under water for from three to six months, the farmers have found Bermuda grass to be an excellent pasture grass for these lands. It grows under water and can not be killed by overflow; it makes an excellent sod, and produces an enormous amount of feed, in fact in some sections it produces more feed as pasture for cattle and all kinds of livestock than any forage crop that grows in those parts, and every species of animal appears to be fond of it, especially cattle, horses and sheep, and even chickens. Bermuda grass will stand both drought and overflow and for pasture nothing, not even alfalfa, equals it as a forage grass for those sections. It grows very thick on the ground, a perfect mat, but does not grow tall, and probably would not make hay. It does not grow readily from the seed, which is very small and insignificant and hard to obtain, yet the seed stores of California carry it, but it costs $1 a pound generally. The easiest way to get a stand of it is to cut the sod in the spring, chop it up as fine as you can (every one-inch piece will grow) and cover well on plowed ground.

Bermuda grass does best on wet land, spreads rapidly, makes a heavy sod and is difficult to get rid of when once established, but any one having wet land once in Bermuda grass in the districts above noted do not want to get rid of it, as it is too valuable a forage grass to replace with anything for feed for stock. It is claimed by many that it produces more and better feed for dairy cows than any grass grown, and that milk produced from it tests higher than that made on any other grass. but it loves hot weather and plenty of water. Of course the foregoing relates to the grass under extremely local conditions and in stock-raising sections; in parts of the State largely planted to orchards or any permanent cultivated crop, it is a pest of the worst kind.

WOOLY APHIS.

"A Constant Reader," Santa Rosa, is informed that the remedy for the root form of wooly aphis appeared in the issue of Nov. 3rd, 1905; but as others interested may not have saved the "Cultivator," as carefully as "Constant Reader,“ we reprint the answer to the query.

"Your tree is infested with wooly aphis. It is easy to kill the form above ground, but you should look for the root form, which is by far the most destructive. Almost any spray will kill those in the tops—distillate is best. For root form: Dig down six inches and make a basin three or four feet around the tree, just before rains come. Distribute in this basin about three pounds of tobacco dust. The rains will carry this down and kill the aphis.“

The shield or plate bud of the walnut which you ask about is a section about an inch wide (around the branch) and about two and a half inches long(lengthwise of the branch) with the bud in the center. This piece is laid on the branch to be budded, marked, and the piece cut out so that your plate with the bud will fit in its place. It does not go under the bark at any point, but is merely a plate to replace that taken out and of precisely the same dimensions. To insure the bud plate to fit it was recommended in the article you mention, that a double bladed knife (made on the anvil, and with blades two and a half inches apart) be used to cut out the old plate as well as the one with the bud. With such an instrument the bud plate must fit.

POULTRY BULLETIN.

Editor Cultivator.—Will you please tell me through your very valuable paper how to address a letter to Berkeley in order to get the Bulletin on Poultry Food? F. E., Anaheim.

Director Agricultural Experimental Station, Berkeley, Cal.

CRAPES FOR SANDY SOIL.

Continued from page 124

than Missions that it is not worth while to grow them in competition with some other grapes in its season. Blue Portuguese is similar to Mission, it comes in with the earliest grapes and sells well in its season. It produces well on sandy soil. Chassalas Rose is a good seller and does well on such soil. It comes early and is of good quality and is attractive. Cinsaut is an excellent grape, supplants Malvoise perfectly as far as fruit is concerned, is better adapted to dry sandy soil than any other variety that we know of. The fruit never cracks as Malvoise does sometimes. The only objection to it is that it is too tender to ship long distances and the bunches are rather compact. For local markets it is very fine and sells readily. For a purple grape, it can't be excelled in looks and the quality is good. Golden Queen is perhaps our most prolific grape on sandy soil. It ripens in October and early November. Is of good quality and will ship well to local markets, bunches are similar to Muscats, but more perfect in form.

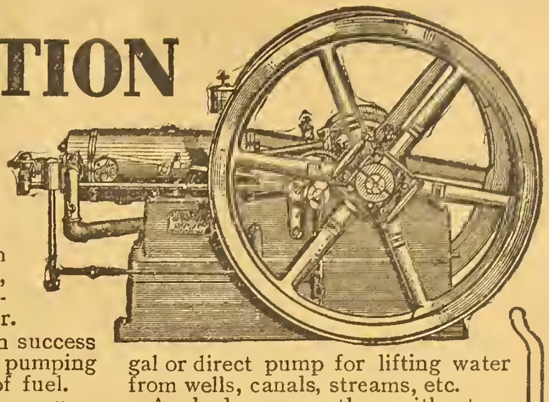
The finest shipping varieties require a heavy subsoil to produce the best quality. Tokay, Emperor and Cornichon bring the best returns for table grapes when well grown, but this cannot be done in a sandy wash. The varieties we have mentioned have produced well in sandy soil in the San Bernardino valley. Malaga has given fair results also.

We would not advise planting many varieties unless you expect to peddle the fruit. We have known Malagas to bring better average returns than oranges in an acknowledged orange location. We have known Eucalyptus trees to excel both in such locations as you describe. Of course your subsoil may be good enough to suit any sort of grapes.

Grapes can be grown without irrigation in some locations, but not in others. Good crops may be raised without it and the same vines may produce better crops with it—that is usually the case. If your sand and gravel is deep, say ten to fifteen feet, your vines will have to hustle without irrigation unless the water table is close.

Grape cuttings should be kept moist from the time they are cut till they are planted. Plant cuttings about a foot long, cut with a bud near the top. Plant the cuttings straight up and down with the top bud at the surface. There is no use in planting long cuttings at an angle. Don't punch holes and drop the cuttings in, but force the cutting into the soil so that the lower ends are firmly imbedded in the soil. If you expect to plant cuttings where the vines are to grow, make your cuttings at least 18 inches long and leave but one bud above ground. The best way to start a vineyard is to grow the cuttings in a nursery, select the best plants (if you have a spite against your neighbor, give him the poor ones or advise him to plant cuttings) cut the roots to a length of six inches and plant the vines clear to the top bud as it grew in the nursery.

We have never yet seen a perfect stand in a vineyard where cuttings were planted. It costs as much to care for an uneven stand and it cuts down the net profits, besides makes the vineyard look ragged and reduces its value as an income maker or a selling proposition.



FOR
IRRIGATION
By
PUMPING

For all those who wish to irrigate by pumping, the I. H. C. gasoline engine is the one best power.

The difference between success and failure in an irrigation pumping plant is often a question of fuel.

The I. H. C. engines use gasoline—a cheap and easily transported fuel.

They take the least fuel and convert it into the most power.

They are unequalled when put against a steady load as in pumping, and sustain their full rated power with persistency and regularity.

They can be belted to any centrifugal or direct pump for lifting water from wells, canals, streams, etc.

Anybody can run them without expert knowledge or previous experience.

They can also be used as a general purpose engine for sawing wood, cream separating, feed grinding, etc.

They are made in several styles and sizes—

Horizontal and Portable—4, 6, 8, 10, 12 & 15 Horse Power.

Vertical—2, 3 & 5 Horse Power.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

Household Department

NOW.

If you have hard work to do,
Do it now.
Today the skies are clear and blue,
Tomorrow clouds may come in view,
Yesterday is not for you,
Do it now.

If you have a song to sing,
Sing it now.
Let the notes of gladness ring
Clear as song of bird in spring,
Let every day some music bring;
Sing it now.

If you have kind words to say,
Say them now.
Tomorrow may not come your way.
Do a kindness while you may,
Loved ones will not always stay;
Say them now.

If you have a smile to show.
Show it now.
Make hearts happy, roses grow,
Let the friends around you know
The love you have before they go.
Show it now.
—Chas. R. Skinner, in New York Sun.

Love and Loneliness

The sun had buried half its red disk below the border of the prairie, and the silence of the night was settling down over the expansive plain of grass. Partially sheltered by a few mesquite bushes, burned a small camp fire; and near it sat a young woman on the ground. with clasped hands, and with beautiful, sorrow-fixed eyes staring into the face of a dead man lying stretched upon a blanket with his feet toward the fire.

Still, motionless as the dead, sat the girl, while the darkness deepened round her, bring the outline of her form into bolder relief in the glare of the blaze. The trace of tears was on her cheeks, but her eyes were dry now, her features bearing a hard, strained expression, but one which could not quite dim the marvellous beauty of her face.

The sun sank lower and darkness came on, bringing the light of the camp fire into clearer distinctness. Alone, with the body of her dead father, miles from any human habitation, on the open prairie, with the night before her; the terrors, the awfulness of the situation had stunned the girl, and she could only sit on her feet and stare into the dead face before her.

Only a year before, how different all had been. But misfortune had been sure and swift, and broken in health, the father, seconded by the daughter's wishes to go far away from the old associations began that emigration to the West, which had ended here on the broad prairie. One of the wagon horses had died the day before, provisions were getting low in the locker and the end of all seemed very near to the girl. The thought came to her that if she could but lay her head upon the now cold, pulseless breast of her father and pass peacefully away, as peacefully as he had passed, all would be well, the end of things would have been fitting. But she felt the great strength of her young arms, the vigorous action of her heart—starvation would be slow. And in the meantime decay would come to the loved form before her, the blistering sun of the day-time would rapidly accomplish it.

The girl sat and thought of these things, while the night deepened round her. Everything was deathly silent, until the sharp yell of a prairie coyote cut the silence like a sharp-toothed blade. The girl shuddered. Another yelp came from out of the grass near by, and this was quickly followed by others.

The girl crouched lower toward the dead man and almost held her breath. She recalled the many stories she had read and heard repeated, of travelers being overtaken and attacked by packs of wolves, and in imagination she could already feel the sharp little fangs of the coyotes tearing her soft flesh.

But the fire still burned, a steady flame, the one point of reflection in a vast sea of darkness. How long would the suspense last came the thought to the girl. She dared not look around her, in the dread of encountering the hungry gleam of myriads of little eyes which she knew must be looking out of the near by darkness. For a moment her thoughts dwelt upon her own name, "Sylvine," given her because her mother had loved the woods and now Sylvine was associating her present situation with stories of the Russian and Northwestern forests.

She took the cold hand of her father in her own and stroked it gently. And she prayed, not to escape, but that the pain and torture of it might be short. And while she prayed, the sound of hoof strokes came to her ear, and she shuddered again in sympathy for the poor beast which had been hobbled and turned loose there to find his food.

But the shudder had scarcely passed, when the sharp report of a rifle, followed by the howl of a coyote, rang out quite near the camp. Then came a rapid fire of shots and by a good marksman, for they told effectively among the wild dogs of the wilderness in the glare of the lone protecting camp fire. And the sound of a voice also reached Sylvine's ear, a human voice, at the moment of her deepest despair.

"Hello," said the voice.

Sylvine arose and turned about.

"I take it ye're in trouble, Miss," continued the young man, dismounting and coming forward; "an' I thought if I could lend ye a hand." The eyes were frank and blue, and the face smooth and boyish, under the turned-up brim of the broad sombrero.

"I'm jest a herder, Miss," he went on, "but folks in trouble are always my folks, especially if they're in frocks. I saw the situation from a little way out and took the liberty of droppin' a few o' the aggravatin' coyotes, though they were only after the dead hoss, an' maybe, the—the—" The man glanced toward the corpse. "It's your father, is it Miss?" in a tone which bore the true ring of sympathy.

Sylvine nodded and, while tears began to fall from her eyes, she made a step toward her would-be protector.

"It was awful," she said, "being here alone and unable to die, too."

"To die, too? Well hardly, The Lord knows his business. There are flowers He can't quite afford to have cut down. They light up the blank spaces, you know, and make folks remember there's a heaven. I thought of that the moment I looked over the grass here and saw your face in the light of the camp fire, seein' how death had been at work around ye."

Sylvine had drawn a little nearer to the young man, with a feeling of unhesitating confidence.

"I know it was wrong to wish for death, but all was so terribly, awfully lonely. There seemed nothing left in life for me."

" Well, I don't know about that. I've been livin' lonely for some years myself, an' I guess I've enjoyed it fairly well, though there has always seemed to be something lackin', couldn't tell jest what—till—till a few minutes ago. But maybe I'm talkin' too much. My ranch is not far off. The boys call me 'Lonely Lem.' I've got a doby off here to myself, and ye're welcome to the whole inside of it, for as long as ye want to stay, an' I'll stand guard on the outside. An' when ye want to go, I'll take ye across country to the railroad, forty miles from my ranch."

Lem stooped, gently lifted the corpse from the ground and placed it in the wagon. Then, harnessing his own and the remaining team horse to the van, he assisted Sylvine to a place in front, and drove away, with only the starlight to guide.

BURN AIR AND SAVE FUEL
You can do it with the
HAGUE IMPROVED DOMESTIC OIL BURNER
It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for th least money, write for information to
Hague Domestic Oil Burner Co., 810 So. Spring St., Los Angeles, Cal.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.
Tourist leeping Car Lines
Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

Lonely Lem had found a new occupation in life. He was guarding a treasure in his doby that to him grew more precious each day that Sylvine remained under his protection. And he began to look forward with an accompanying heart-ache to the day when the girl's grief had grown old enough for her to care to leave the vicinity of her father's grave. Each day added strength to the one thing in Lem's mind that the one thing needed to piece out his life was a woman's love, and that woman. At this point in his thoughts, Lem would invariably shrug his shoulders in awe of the gap that seemed to lie between them.

At last the day came. Sylvine stood in the doorway looking out across the prairie toward the sunrise, while Lem sat at her feet.

"I feel," began Sylvine slowly, "that I have imposed upon your goodness as long as I should, and it is time for me to go away— away—somewhere. But heaven only knows where I shall go." The girl suddenly dropped her head upon her arm and burst into tears.

Lem sprang to his feet and hovered over Sylvine in the doorway.

"Is it as bad as that, little 'un?" he cried, close to her ear. "Because, if ye're lonely, I guess it won't offend ye if I tell ye about what's been burnin' inside o' me ever since I first saw your face in the light o' the camp fire, with the coyotes yelpin' around ye."

Sylvine was silent. But something caused her to lean toward Lem.

"I knew all the time, little 'un, somethin' had been left out o' my life, an' that moment I found out what it was. But I never meant to take any advantage o' ye, an' kep' my love to myself. But I've lain out there under the stars, nights, and gazed into the sky for hours an' hours, wonderin', jes' wonderin' to myself if it was possible one like you could ever find it in her heart to love one like me."

"And I—" Sylvine now leaned against his breast, and her arms, thrown back over her head, had caught Lem's neck. "I've been loving you all these days."

Lem's face was now drawn down until his cheek and Sylvine's were pressed together. And Lem whispered:

"Little 'un, ye've made me so happy I don't reckon I'll ever want to do anything else but laugh an' sing."—C. S. Reed, in American Queen.

HOW TO ENJOY COUNTRY LIFE AND WORK.

If the farmer's wife has not an inborn love of "green things growing" she is to be pitied. It is not necessary to have been born in the country to have this love. A physician tells of finding a child born and living in a city tenement, who had an onion growing in a tomato can. The child had polished the little window of the room in order that the onion might have a better chance.

It is quite necessary and a good deal more practical to have also ,a love of making the green things grow and taking a vital interest in all that pertains to successful growing in all departments of farm life.

Should a young woman fall in love with a farmer, and have a chance to marry him, she should ask herself "Am I in love with his vocation?" If she promises to take him for better or worse with the mental reservation, "I'll make it better by getting him out of his present business," she is doing a very foolish thing for both. A young wife with such an idea tucked away in her pretty stylish sleeve will find bitter disappointment in store for her.

She thinks he will go to the city to please her, because of his love for her. But in nine cases out of ten if the man spoke he would say: "I was tired of being nagged."

The intelligent young man who has spent several of his most receptive years in working a farm is fitted for anything except an entire change. Left where he is, he is in the way of becoming a chemist, a botanist, a machinist, a mechanic, a veterinary and an electrician, for it takes all these sciences to run a farm properly these days.

Now let a city girl whose ideas of gentleman comprise clean finger-nails and a high white collar, take a man from an opening like this, and set him behind a clerk's desk or ask him to travel with samples of things in a big trunk, what will be the result?

"You look as if there had been a rise in real estate," laughed the girl he might have married, as the young farmer came in from the field with only his white teeth and the whites of his eyes visible for the dust.

"There really has been a great move in land in this wind," he replied, as he plunged his face into a basin of water.

"I feel as if I had married a coon," hummed the woman he really had married. "Thank heaven this is the last season he does that kind of work. He has promised to move into town." Afterwards she whispered, "He is really too much of a gentleman for that sort of thing."

Two years later the man was unloading cars for a coal company and his dainty wife was shedding tears of sorrow over her fatal mistake.

"But it is all such drudgery," says one. That depends on the point of view. When the trained nurse waits at the bedside of the sufferer hour after hour intent upon every method she can use to relieve pain; when the sculptor bends over his marble with brows knit in thought, and cheeks pallid from intense application to his art; when the artist lays down his brushes at the going down of the sun and walks across the studio to study the result of his long hours' work, or when the writer awakes from his absorption and finds his fingers all cramped and aching, do they talk of "drudgery?"

If a farmer's wife is interested in her work, it becomes to her a science, an art, an inspiration.

A woman once said, "The most strenuous year of my life was, I think one of the happiest. It was the first summer I had the use of the new milk house, with ice house attachment. We had just discarded the old milk pan and dasher churn, and I was happy as a child with new toys, in my cans for deep setting in a tank of cold water, and the new barrel churn. I churned every morning all summer long except Sundays, and sold forty pounds of butter a week.

With what pleasure she recalled that the butter reached her private customers all that summer with the napkins which wrapped the rolls of butter frozen to the roll.

"There was," she said, "an elm tree growing near the door of the milk house, with its slender limbs reaching over the door. Every morning, for weeks, when I was churning, an oriole or golden robin came and sang to me, sitting on a limb not over twenty feet above my door. Whether the rhythmic beat of the cream against the side of the churn attracted the lovely songster or not, I had no idea. There the little fellow sang to me every morning for weeks, making a musical accompaniment to my work."

After the butter was carried to the cellar and the room cleaned up, a bowl of roses was always placed on a shelf near the tank through the whole rose season, for nearly every hour of the day some of the family was there for a drink of cold milk or a tool from the chest which stood in a corner.

"That was twenty years ago," said she, "but ever since, the scent of roses or the sight or song of the golden robin brings thoughts of that happy summer's work."

Dr. Holmes said that we talk to find out what we think. I believe the average farmer's wife would not understand what he meant. Her thoughts and ideas are a part of her—as the shrubs she had planted are part of her garden. As one of them sings, "These are the thoughts I think myself, in my backyard," and they were beautiful thoughts that had come from country living and country thinking.

This yard with all its homely details may prove the vantage ground of many a victory, the background of many a renunciation, which really means achievement.

In retrospection the farmer's wife may often see all these things and lifting her eyes away to the eastern sky line, or looking over west perhaps, to the forest or hills or away—away over infinite stretches of vastness, their influence quiets the storm that often breaks over less disciplined souls, and she feels with the Hermit of the "Little Maxie" that all these great thing of the earth are saying "Hush!" "Hush!" and she understands.—The Farmer's Wife.

Cookery Recipes

Cold Slaw.

Cut 1 medium sized cabbage head, salt and let lay 2 hours, and squeeze out all the salty juice and place in a dish. Add to this half cup sugar and two-thirds cup of cream (either sweet or sour) and stir until it is foamy, then add two-thirds cup of lemon juice.

* * *

Buttermilk Nut Cake.

Two cups granulated sugar, half cup butter, two cups fresh buttermilk, 1 large teaspoon soda in milk, 1 cup chopped raisins, 1 cup chopped English walnuts, 3 level cups flour, 1 teaspoon nutmeg, 1 teaspoon cinnamon, bake slowly.

* * *

Pumpkin Pie.

To a quart of boiled milk put a quart of strained pumpkin, add one and one-half cups sugar, 4 well-beaten eggs, a teaspoon each of salt, cinnamon and ginger and 1 dessert spoon butter melted in the hot milk; to mix the ingredients, stir the sugar, cinnamon and salt into the pumpkin, add half the milk and stir well together and then add the remainder, and lastly the eggs. The recipe makes four pies and is very nice.

* * *

Mush, Corn Meal.

Into an iron kettle put 2 quarts of water, salt and when boiling thoroughly sift slowly through the fingers 1 pint of meal, that it may be very smooth; boil and stir 15 minutes, then set back on stove and cook slowly for one hour.

For Frying—Pour the hot mush into an earthenware bowl containing 1 tablespoon of milk, that it may turn out smooth when cold; then cut into three-quarter-inch slices, roll in flour, place in hot skillet containing 2 tablespoons of butter and 1 of lard (or use meat fryings,) brown slowly. turn and finish on back of stove for 30 minutes.

Milk is an excellent substitute for soap in washing dishes. It not only softens the hardest water and gives dishes a clear, polished look, but it prevents the hands from chapping . It also prevents a greasy scum appearing on the top of the water. Use about half a pint to a gallon of very hot water.

Even the pure-water drippings from the faucet leave their mark until with much wiping and much polishing we are mad—in more senses than one.

Kerosene in the boiling water whitens clothes safely, especially such as are yellow from lying. Put in a tablespoonful to each gallon of suds.

Farmer Hyer—"How much milk does your cow give?"

Farmer Myer—"She never gives any; you got to take it."

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valnable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

CHRONIC LYMPHANGITIS.

Editor Cultivator.—I have a horse that has chronic lymphangitis. One hind leg has been in an enlarged condition for several years. About a week ago he had another attack of the disease and both hind legs became much swollen. I should like to be advised whether or not there is any known cure for this disease. The horse is valuable and at least worth effort to remedy his condition. C. M. D., Lakeview.

It will be impossible to remove the swelling, chronic, form. You can help the recent attack by giving a physic, and afterwards give dessert spoonful of Nitrate Potash once a day for a week. Bathe the leg often with hot water with 1 ounce Kreso Dip to a gallon of water.

* * *

VACCINE VIRUS.

Editor Cultivator.—A man here wants to vaccinate his hogs against hog cholera. Says there is such a serum in the East, but has not been able to find out about it here to his satisfaction even by asking through the paper. He says you told him some plague is so often called cholera, in which case vaccination for cholera is not effective. Says he knows he has cholera sometimes in his herd and wants to know with what to vaccinate. H. G. H.

Yes. there is a product manufactured by the Bureau of Animal Industry at Washington, D. C. They claim it is a preventative and reduces the death rate about 70 per cent. You will have to apply to the Bureau for it and get instructions.

* * *

Ruptured Blood Vessel.

Editor Cultivator.—I have a horse that has gone blind with a light scum in the watery portion of the eye, caused from a strain which ruptured a blood vessel and caused bleeding from bowels. Is of dropsical nature, well from sickness for two months, but eyes do not improve. Can you give me a cure? D. D. B. Rialto.

Leech the film on the eye once every two days with nitrate silver. 5 grs water distilled 1 ounce. Use camel's hair brush. If the light affects the eye cover with dark cloth.

* * *

Ulcerated Membrane.

Editor Cultivator.—We have a horse that has an ulcerated sore on the side of his nose, extending from the edge of his nostril half way to his lip. The horse had the sore when I bought him over two years ago. I did not expect any difficulty in healing it, but it proves very obstinate. Have tried many ointments, etc., with little effect. Am at present using sulphate of copper, dissolved in water to cleanse it, then powdered sulphur rubbed on dry. The sore scales over and then if not washed off the next day it sloughs off and his nose is as sore as ever. He has several sore places along the line of the middle of his belly, from between his forelegs back to his sheath, where the hair is rubbed off and little swellings show, which evidently itch, as when rolling he will sometimes get squarely on his belly, work his body back and forth to scratch it. The horse is a high spirited, yet gentle animal and a fine traveller, but is thin in flesh most of the time. I feed him oat hay and two quarts of rolled barley twice a day. Kindly reply through the Cultivator as I am a subscriber withholding my name. R. H., Lakeview.

Apply a little calomel to sore day or two where it scales off. Wash the sores under the belly with solution of Kreso Dip tablespoonful to gallon warm water daily. Spoonful twice a day of Fowler's Solution.

The Produce Markets

Los Angeles Markets.

Los Angeles, Feb. 8, 1906.

Eggs are lower than for many months and no advance is expected soon, as the supply of both local and imported is constantly increasing with the advent of warm weather.

Butter maintains a firm tone as quoted, with no prospect of a change unless heavy rains come and increase the supply of green feed. Cheese receipts are heavy and the demand active.

Vegetables are more plentiful and prices easier.

Poultry supply is light and the demand good.

Mrs. M. A. Ellis offers bees for sale this week.

J. C. Peters of Hemet, advertises a fruit and poultry ranch for sale.

J. C. Ostergard and S. Fairburn are advertising watermelon seeds for sale in this issue of the "Cultivator."

Attention is called to the advertisement of the Henry L. Bauer nursery in this issue. Everythng for the home, garden or ranch.

A ranch in Shasta county is for sale and advertised in this paper by M. J. Forbes.

White Plymouth Rocks are offered for sale by Mrs. Hansen, of Coachella this week.

Ira D. Brown advertises an excellent garden tool in this issue.

If you are looking for a good ranch, notice the Chino ranch advertisement on another page.

Fine berry plants can be had of S. T. Stanfield, whose ad appears in this issue.

SEED PEANUTS FOR SALE.
Best Californias: foothill grown: shelled or unshelled. The best seed in every way. Quantity limited. Place orders at once. Prices very low.—H. E. WARD, Charter Oak, Cal.

A NEW NURSERY CO.

The Sycamore Grove Nursery and Landscape Co. is the name of the successor to the old Sycamore Nursery Co. of Los Angeles, formerly owned by I. J. E Saint. Mr. Saint is still connected with the company and with him is associated Mr. W C. Warner, formerly of San Diego. The new company will carry a full nursery line and in addition will do a general landscape work. Places will be landscaped set out, and if desired, will be cared for during the first few years.

San Francisco Markets.

San Francisco, Feb. 7, 1906.

Butter.

Weaker markets prevailed for all descriptions of Dairy Products yesterday, the continued mild weather causing increased arrivals and buyers, in anticipation of lower prices, restricting their orders to absolute current needs.

Fresh Calfornia extras	28½

CITRUS MARKETS

The citrus market has been very strong at most Eastern points during the past week, and prices have been uniformly good. In New York the sales have run from ten to twenty-five cars per day, while in Boston the average has been about fifteen cars daily, with Philadelphia about the same; other points correspondingly. Heavy consignments of foreign lemons are arriving in good condition and bring good prices.

NEW YORK, Feb. 6.—Twenty cars sold at auction today. The market is 25 cents lower. The weather is very cold.

Foreign Lemon Sale.

NEW YORK, Feb. 6.—Twelve thousand boxes of Sicily lemons were sold at auction today; they were in good condition. The market is firm. The next sale will be held on Friday, when 7000 boxes will be offered. Prices realized were as follows:

Fancy 300's, $2.20 to $2.50.
Choice 300's, $1.95 to $2.20.
Fancy 360's, $2.25 to $2.40.
Choice 360's, $2.00 to $2.25.

CALIFORNIA VEGETABLE GARDENS.

(Continued from first page.)

done. The same applies to us. It takes a strong will to throw out what looks like prospective profits. But the increase comes by culling closely. We should make the standard so high for our produce that the Oriental's stuff will be relegated to the rear. It should be so good that it will be American. The distinction should be so plain that the dividing line will show in the market.

Gardening is not all pleasure and profit. But the commonest of garden products are profitable when properly handled. A commision merchant said to us a few days ago, "Why don't you grow lettuce? There is $300 dollars per acre in it." He did not intend to convey the idea to me that all who grow lettuce are making $300 per acre. Let us see. Set lettuce 8 inches apart in the row, set the rows 12 inches apart and on one acre can be grown 5308 dozen heads. This leaves nothing for loss in growing but an expert is directing the work and under a high state of cultivation they are all growing and thriving. He will have some culls. but not as many as the novice. It can be readily seen that $300 per acre is a conservative estimate. And yet this is one of the commonest of garden products.

The point is made that the price that our land values have attained will not justify farming it. This is not true in the face of such figures. It will stand yet another raise. The resourcefulness of our soil and our proximity to market will give it yet another jump. It is our best avenue to intensive farming. It is the kind in which we can make every inch pay. The time was when one could grow some garden on part of the land and let the remainder go to barley, or some other cheap crop. Time is too precious and values too high to do so now. We can not afford to have pasture land. Feed the vines and the culls to the cow or to the poultry. or to something else that helps to make the living. There should be no waste in the fields of the market gardener. Neither in space nor product. With reference to space, do not think of the acres, but watch the inches. The rows sould be correctly spaced that the water and cultivator may have full effect. Care should be used in preparing the seedbed and planting that the stand may be perfect. The soil should be watched and carefully guarded. Should it cement below the points of the cultivator, break it up. Should the humus disappear, restore it with a coating of stable manure between the crops. There are so many things to watch. And the greater is the necessity of a concentration of effort. If the forces of the gardener are thus placed in one line the result will be entirely beyond the conception of the careless one who tries to fill the entire list of market quotations.

The field is open and it is large enough for all who desire to enter the contest. It is so varied that the rich and poor have a like show. Gardening under cover with artificial heat is a line in which the man of means can enter. He can use his science and money in making the season to grow that which is most fascinating to him, and with good returns. The poor man can take his $40 dollar horse cultivator and hoe and make a showing. He requires but little land as so many of the crops require but from three to five months to mature. He who has but little space can take up special work accordingly. It is not within the scope of this paper to treat of this special work even if we had the knowledge to do so. The Agricultural Department at Washington has bulletins, for free distribution, by the very best authority, on all subjects in which one may be interested. These give fully the culture and treatment of different plants as well as the best methods for subjecting and destroying their enemies. And in the power to overcome the enemies of the garden lies a large part of the gardener's resources; the treatment of seed and plant to prevent its destruction or the marring of its beauty. On the other hand the use of nitro culture and the application of fertilizers best suited to the condition of the land and the crop desired, tend to the very highest state of perfection and the greatest quality possibly may be attained.

The culture of mushrooms, horseradish, pie plant and even flowers for market—things not so common as peas, beans and melons which we all grow—might make fame and fortune for some one in Gardena valley should it be undertaken.

Then, the co-operative idea of growing, by uniting the entire community in their individualized lines for the season, and marketing in this way; thereby enabling the community to ship in assorted car lots is worthy the consideration of our gardeners. The affairs of the industry should be conducted in a way that the term truck gardener will no longer be applied, but that of Market Gardener in highest sense of the term. Let the Chinaman be the truck gardener. But we Americans should be the market gardeners and give the industry that dignity, pleasure and profit that is the envy of our fellow man from what ever country he may come. (Paper read at Gardena Farmers' Institute.)

POWER PLANTS, PUMPING MACHINERY AND WATER SUPPLY GOODS 212-214 S. Los Angeles St., Los Angeles, Cal.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pump-head using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

MALTHOID ROOFING.

An exceptionally valuable product selected by the builder of the new nine story Bilicke-Rowan hotel.

It is a well known fact among the builders of some of our latest and most expensive structures, that Malthoid roofing has been an important factor. Twenty-one years' experience in making, improving, laying and perfecting roofings enabled The Paraffine Paint Co., the manufacturers of Malthoid roofing, to produce in this material a roofing that is as nearly perfect as possible, and when compared with other roofings is noticeably superior, even to the laymen.

Malthoid roofing is coated with non-oxidizing weather-proof coating, this combination producing a roof covering good for all time, in all climates, under all conditions. Malthoid roofing is absolutely acid-proof, alkali-proof and fire resisting. Red hot coals placed on the flat surface will burn out and not ignite the roofing. Fumes smoke and gases mixed with rain or fog often produce an acid that destroys and decays metal roofs such as tin and iron, but have no injurious effects whatever on Malthoid roofing. Firebrands and sparks very often set fire to shake and shingle roofs while they become dead on a building covered with Malthoid, without injury to the roofing.

The writer of this article was shown many letters from users of Malthoid roofing, congratulating the manufacturers upon their success in manufacturing a fire-resisting roofing. The management of the Lewis and Clark Exposition selected Malthoid roofing for the covering of the fair buildings at Portland. The Paraffin Paint Company received the highest award at the Lewis and Clark Exposition on their Malthoid roofing, P. & B. Ready roofing, building papers and damp-proof compound. Malthoid roofing is a splendid roofing for high-class buildings and dwellings, yet cheap enough for factories, warehouses, depots, wharves, barns, schoolhouses, etc. Malthoid comes in rolls very compact, conveniently handled and cheaply transported at a low freight classification. The offices and warerooms of the Los Angeles branch of the Paraffin Paint Company are situated at 313 North Los Angeles street, city, from which point all business of the company is taken care of in the southwestern part of the United States, under the management of Mr. E. G. Judah. Agencies in almost every town west of the Missouri River. Refinery and factories at Paraffin, Alameda county, California. Main offices San Francisco, Cal., 24 Second street.

CONTROLLING NATURE.

Among the interesting steps in modern progress has been the control and development of plant life. People now living can remember when the number of edible fruits and vegetables was far less than at present, and even those that could be grown were vastly inferior to what we now have. For example, our parents knew nothing of the tomato except as a curious ornament in the garden. Sweet corn was hardly better than the commonest field sorts. All oranges had seeds. Celery was little known and poor in quality. In the flower beds the magnificent pansy has replaced the insignificant heart's ease from which it was developed, and the sweet pea traces its origin to the common garden vegetable. The practical results are accomplished by men operating largely for love of the work,like Luther Burbank in California and Eckford in England, as well as by the great seed merchants. D. M.Ferry & Co., of Detroit, Mich., who are not only externally vigilant to hold what ground has been gained, but have a corps of trained specialists backed by ample means to conduct new experiments. The results of their experience can be found in their 1906 Seed Annual which they will send free to all applicants. Mention Cultivator.

W. H. Brown, agent Armours Fertilzer Works has a card in this paper which should interest everybody who is considering the question of using fertilizers. See his advertisement and write for particulars.

The M .Bettman Co., of San Francisco, advertise "Caustic Soda" and parties interested will find it to their advantage to correspond with this firm.

$500! What About It!

Look for a Little Envelope in the 100 lb. Sacks of

Coulson's Special Dry Chick Feed

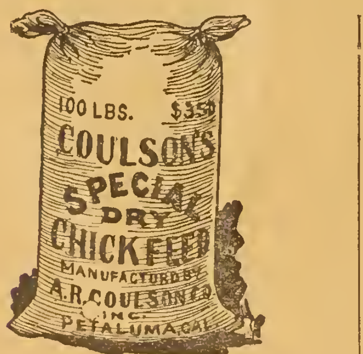
For Little Chicks and Turkeys

Send me another sack of Coulson's Chick Feed. It seems to be just the thing for young chicks, they are doing fine.—H. A. DUN, Tacoma, Wash.

$500

It's Great Food to Make Chicks Grow

$500



You will have the best success you ever had in raising chickens if you will feed COULSON'S SPECIAL DRY CHICK FEED. Send for sample. Its good for turkeys as well.

This Chick Feed is composed of small pieces of cracked grains, also a variety of seeds and small pieces of charcoal, meat and bone. It therefore contains a variety of the best and most wholesome ingredients in the right proportions to promote the growth of chicks and turkeys and fully nourish them so they will reach maturity early, and be vigorous, strong, healthy birds.

ECONOMY IN USING COULSON'S SPECIAL CHICK FOOD.

By a series of tests it is found that chicks will gain weight much quicker on COULSON'S CHICK FOOD, AND at less cost than those fed on grain.

Chicks fed on COULSON'S CHICK FOOD will reach the weight of two pounds a month sooner than those fed on grains, and they will reach the average weight of three pounds eight weeks sooner.

With COULSON'S SPECIAL CHICK FOOD and COULSON'S GROWING CHICK FOOD many succeed in raising from 95 per cent to 98 per cent of the chicks hatched and you can do as well. TRY IT THIS YEAR.

Mr. Poultryman, there is only one way to buy, and that is, on record of what you want. If you want to raise lots of nice chicks, buy good feed.

I think your Chick Feed in fine. I never lost one while I fed it. and never saw chicks grow so fast in my life.
MRS. HATTIE DEAN.
Mesa, Washington.

COPIES OF LETTERS RECEIVED.

I like your Special Chick Food better than anything I have ever used.
MRS. GEO. THISSELL, Jr.,
Winters, Cal.

$500. What about it?

I have used your Special Chick Food since last March, and am still using it. I believe it to be all right. I have lost less chicks than other years. It is good—the best I ever bought.
R. A. WHITFORD.

I have used your Special Dry Chick Food and recommend it to all my neighbors.
MRS. IDA L. PARKER,
Eureka, Cal.

BEGINNING LIFE ON COULSON'S CHICK FOOD

Our chicks are doing splendidly on the Special Chick Food. No losses except by accident.
J. HUNTER.

COULSON'S FOODS GIVE BEST RESULTS.

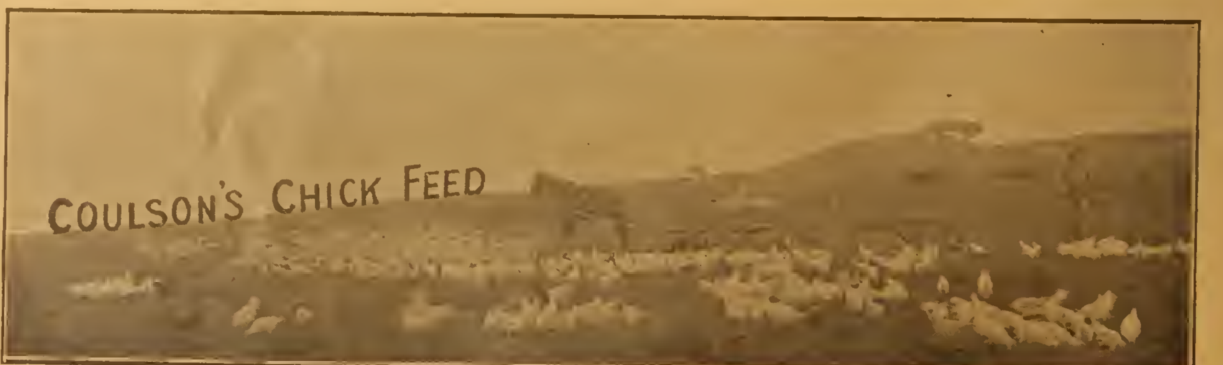
I am a user of Coulson's Chick Food and have raised 1100 chicks this winter. The first hatch I used some other food and lost over sixty. My second I raised on COULSON'S CHICK FOOD, according to directions, and lost only ten. Then in my third hatch I fed COULSON'S CHICK FEED—dry—three times a day for three weeks and out of 394 chicks, I lost only two, and all are doing fine. Now, chicken raisers in this locality are wondering at my success, and I am praising COULSON'S FOOD as much as I know how. (Signed) F. E. HEUSEL,
Half-Moon Bay, Cal.

COULSON'S CHICK FOOD.

Contains ingredients that long experience in poultry raising has found best adapted to give nourishment to growing chicks. It is promptly digested; causes no indigestion; keeps bowels in normal condition. Chicks show increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first five or six weeks. Save your chicks and make good profits.

Keep them from bowel trouble and all ailments incident to the first five weeks. Profit lies in the chicks you raise to maturity—not in the number hatched. Give them a ration that makes healthy, well developed bodies

Remember Mr. Basset sold broilers only six weeks old for $3.75 a dozen. They were fed on Coulson's Chick Food.



TEN WEEKS OLD CHICKS RAISED ON COULSCN'S CHICK FOOD

Relation of Handling to Keeping of Fruit

By C. Harold Powell, Pomologist, Washington, D. C.

At a recent meeting of the American Society of Refrigerating Engineers, we discussed some of the problems that the fruit grower has to face in building up and extending the American fruit trade. The keynote which determines the stability of the fruit business is a system of transportation that insures the distribution of the crop in sound condition to distant domestic and foreign markets. The discussion referred to the problems in transportation especially concerned with the comparatively slow refrigeration of fruit in refrigerator cars, in the solution of which the interest of the Refrigerator Engineers was solicited. In former discussions before this association it has been pointed out that a large proportion of the losses in the cold storage of fruit is the result of the ripening that takes place after the fruit is harvested and before the temperature is reduced to a degree of cold that retards the ripening processes and the development of decay; that delaying the fruit in the orchards, the packing houses, in transit, or its storage at the warehouse is detrimental to the keeping quality. We have pointed out that the fruit in the center of a package that radiates the heat slowly, or in the warm air in the top of a refrigerator car, or in any other condition that accelerates the life processes or stimulates the growth of decay organisms, shortens the life of the fruit in the warehouse. A refrigerator car is a warehouse on wheels, differing from a cold storage warehouse in having smaller capacity, less refrigerating power and more variable conditions of temperature and humidity. The factors that influence the keeping of fruit in one apply to the behavior of the fruit in the other, with the important qualification that the effects of handling the fruit improperly before it is shipped are more serious in transit than in a warehouse, as the ripening and the decays continue longer before they are finally checked. The need of checking the ripening and the decays by efficient refrigeration is an axiom at the foundation of successful fruit handling, applying with equal force to the keeping of fruit in transit and in permanent warehouses.

Mechanical Bruising the Cause of Much Decay.

There is another phase of the fruit transportation and storage business which needs to be more clearly understood. It is the relation of the physical condition of the fruit to its shipping and keeping qualities. To keep or ship well, it is fundamental that a fruit have a whole skin. Cuts, ruptures, or abrasions of any kind, are likely to be followed by infection by molds. The scores of these organisms are scattered abundantly through out the air, and they cause the fruit to decay if the conditions are favorable for their growth. On the other hand, the spores may come in contact with a perfect fruit without injury to the latter. The fungus cannot penetrate the skin unless the fruit is weakened by over-ripeness or by some other cause. This phase of the fruit handling business has been discussed from the earliest days of commercial fruit culture until it has been worn about thread bare. There is much need of so much progress along this line, and it is of such fundamental importance to the fruit grower, the transportation companies and the warehouse-men, that we desire to bring it up anew and discuss the relation of some of the Department investigations to the commercial losses that occur in shipping and storing as a result of handling the fruit roughly in the orchard and packing houses.

Molds Gain Entrance Through Mechanical Bruises.

A large proportion of the losses in apples, pears and oranges in storage and in transit, and of small fruits as well, are caused by molds of various kinds. We desire to distinguish between the losses of this nature and the losses that result from the over-ripeness of the fruit, from old age. A fruit may die from old age, or it may be killed prematurely by the attacks of some disease. The common soft rot that causes re-packing of apples is a blue-mold rot. The decay in oranges and lemons in transit is usually a blue mold trouble. There is a pink mold that often attacks apples when the skin has been ruptured by the apple scab. Other kinds of molds grow in peaches and small fruits when the skin is broken.

These molds usually enter the fruit through an abrasion in the skin. The cuts or ruptures can generally be seen with sharp eyes without the aid of a microscope. If there is moisture enough present and a temperature high enough to germinate the spores and start them into growth, decay is the inevitable result if the fingers come in contact with the injured portion of the fruit. If the skin is whole, i. e., is not ruptured, the spores may germinate, but the fungus perishes on the sufrace unless the resistance of the skin has been weakened by old age or from some other cause.

These facts are well known to many fruit handlers and to those who ship and store fruit. Unfortunately, they are none too carefully applied in the commercial handling of the fruit business. When an unusual loss occurs in fruits in transportation and in storage, the shipper is likely to seek an explanation of the cause of the trouble in factors with which he has no connection or control. As a matter of fact, the most experienced fruit handlers seldom realize the extent of the injury that happens to fruit in the picking and packing operations and from other causes. The most common kinds of injury are caused by stem punctures, finger nail bruises, cuts of various kinds by dropping the fruit in the baskets, on the piles or sorting tables and in the packages, by punctures from nails projecting through the heads and hoops, by injuries from the header, and by the movement of fruit packed loosely. These injuries themselves are not the cause of decay. They make the fruit susceptible to the attacks of some of the common forms of transportation and storage rots. There are enough of these injuries in lots of fruits handled with more than average care to account for a large proportion of the decay that occurs in fruits in transportation and in storage, as we will endeavor to illustrate by a few examples.

Injury in Handling the Apple.

The ordinary soft brown rot in apples in storage can almost always be traced with the naked eye to a mechanical bruise of some kind. It is not often that a lot of apples shows less than 8 to 10 per cent of the fruit with stem punctures, i. e., with the skin of the apple broken by the stem of another as it falls in the basket, on the pile or in the package. There is considerable variation in this type of injury due to the care of the pickers and packers and to the nature of the variety. The Northern Spy, for example, has a tender, thin skin. The stem is rather stiff. The fruit is readily punctured in handling. This suceptibility to injury undoubtetdly accounts for the reputation of the Spy as a questionable keeper. The Northern Spy, however, is one of the longest keeping varieties, if it enters the warehouse with a whole skin. The Ben Davis, on the other hand, has a thick skin, and the more slender stem does not readily puncture the fruit. The Ben Davis may not develop as much decay as the Spy under ordinary methods of handling. The Spy, however, will keep fully as long as the Ben Davis if it is handled carefully.

In addition to stem punctures, there is frequently a further injury of 5 to 10 per cent from cuts, scratches and bruises of various kinds. In a recent investigation of the Bureau in which it was desired to secure 100 boxes of apples free from mechanical blemishes of all kinds, it required the sorting of at least 500 boxes to secure the desired number. Most of the injury in this lot of apples was caused by the pressure of the fingers of the pickers and by rough pouring of the fruit on the piles, the grading tables and into the packages. It is likely that at least 10 per cent of the fruit had the skin ruptured. Most of the injury in this case affected the appearance rather than the keeping quality of the fruit, as the bruises did not break the skin. As this crop was handled by an unusually careful orchardist, the incident is referred to as a means of emphasizing the need of further progress along this line, and to show the extent of mechanical bruising in commercial apple handling.

In the Fruit Storage Investigations of the Bureau large quantities of apples have been handled in which each individual apple has been critically examined for the cause of deterioration. It is a rare exception to find blue mold decay that cannot be traced to mechanical bruising, except late in the season when the fruit has passed through its normal life processes and no longer has the power to resist the attacks of these organisms.

It is necessary in this connection to consider briefly the effect of delaying the storage of the fruit on the development of decay in bruised apples. If the weather is cool, i. e., about 50 degrees at the harvesting time, the molds start slowly into growth. As the temperature is lowered the rate of growth is still further retarded, but this type of rot develops slowly at the lowest temperature in which the fruit can be stored safely, especially if it has started into growth before the fruit is stored. At higher temperatures the growth is rapid, an infected spot often developing as large as a quarter of a dollar in five or six days at a temperature of 70 to 80 degrees. From the practical standpoint, therefore, a delay in storing fruit that has been handled with great care may be followed by premature coloring up and ripening or by development of scald, but with little actual rot, even if the weather is warm. If the picking and the packing are roughly done, the blue mold rots become a prominent feature in the premature deterioration of the fruit. On the other hand, the fruit may be roughly handled, but little rot develops until late in the storage season if it is refrigerated quickly after picking. The decay develops quickly, however, in such fruit when it is removed from storage to a warmer temperature.

There is no need of having blue mold decay in storage apples. Our experience has been that more than 1 or 2 per cent decay except late in the season, is caused, first by handling the fruit roughly and second by delaying the storage in warm weather, provided, of course, the warehouse has been properly managed.

The Effect on the Keeping of the Orange.

During the past year we have had an opportunity of studying the influ-

FERTILIZERS FOR WALNUT TREES.

The walnut is attracting attention more than ever, and interest in it increases every time there is a report of the prices obtained by the growers. Questions regarding soil and fertilizers, best adapted for the tree are becoming more frequent. Farmers who have poor gravelly soil with water a hundred feet or more from the surface want to know if it is not good walnut land, and if not, what fertilizer is good to use.

It must not be forgotten that the walnut has its limits as regards soil and other adjuncts, as well as the orange. Raising water 75 or 100 feet is expensive and walnut trees do not produce paying crops even in rich and naturally moist land until they are over five years old. Land that requires fertilization from the beginning for walnuts, should be devoted to some other crop. Alfalfa will pay better on such soil where an irrigation head can be raised at a cost of not more than a cent and a half an inch. Deep sandy loam is an ideal soil for walnuts and there are thousands of acres of such soil that is being devoted to grain growing and without water it is better adapted to this than to walnuts.

With such deep rooting trees as the walnut, it is almost imposisble to get some of the ingredients of fertilizing elements to the feeding roots. Analysis, however, shows that nitrogen is the chief element that has to be supplied. The fresh nuts without the hulls, contain about one per cent of nitrogen and .78 of one per cent is ash which means potash, phosphoric acid and other mineral matters which the trees take from the soil. The fresh kernels contain about two per cent. nitrogen and .52 of one per cent. ash. The hulls which are returned to the soil contain about 1.75 per cent ash but only about .15 of one per cent of nitrogen. There is little use of applying phosphate fertilizers to walnut trees except in conjunction with green manuring crops. When phosphates are present in the soil but in the absence of humus, very little benefit can be derived from them. It must be borne in mind that over half of the available potash, and phosphoric acid is found in the humus of the soil. It is the humic acid that keeps the phosphates available. It counteracts the action of the lime which reverts the available phosphates into the same material as bone. As nitrogen would in all probability be the only element necessary to supply, green-manuring should be the only means employed. A light dressing of potash and phosphate would help to produce an abundant crop of this which would in combination give all that is required in the line of fertilization of walnuts. However, the analyses that the nuts and hulls show would indicate that as far as they are concerned, with moderately rich ground, no commercial fertilizers are necessary as long as green-manuring is practiced.

Walnut trees are particularly well adapted to growing green crops beneath them. The trees being bare of leaves during the winter makes it possible to grow crops close under the branches. We would suggest that seed for such crops be sown just after the last irrigation before harvest. The young plants will get some tramping but not enough to seriously hurt them. Furrowing out for irrigation can be delayed till after the crop of nuts is gathered.

It is nearly impossible for growers to use native plants, the seed of which is not on the market, excepting with such burr-clover which comes in sheep manure. The habits of vetches are quite different from most other green-manuring plants, in that they develop a wonderful root growth during the winter months with a very poor showing of a top. About the middle of February the top growth commences and pushes forward with a rapid growth that is much more satisfactory than any other crop that we know of. It is very rich in nitrogen and is more easily handled than peas or lupins. It grows in a tangled succulent mass that is easily cut with a rolling cutter. Its succulency makes it rot quickly which is desirable.

TRIMMING THE GRAPE ARBOR.

The matter of trimming the grape arbor is an important one and each class of grape should have its pruning conform with its habit of bearing, still there are arbors that are never pruned properly. There are always some persons who fail to get crops of some of their favorite varieties of eastern grapes and attribute it to the soil or climate. We know of an arbor near Claremont, over which are trained three Concord and three Niagara vines which have been scientifically pruned ever since they were planted. They were heavily fertilized to begin with, which of course, was a prominent factor in their productiveness. These six vines have produced as much as 700 pounds of grapes in one season, they had this record before they were four years old. The system followed was to leave long fruiting canes with spurs at the bases for renewal, according to rules frequently given in the Cultivator. All eastern varieties of grapes produce best from growth starting from long canes. They have grown and borne fruit so long on this plan that it is better to allow them to follow their inclination. We have noticed numerous arbors of these varieties that have been pruned back to the old stems; others have been pruned long without any spurs having been left. Either of these plans are undesirable. Apply the long pruning method to your arbor grapes of eastern varieties.

Such grapes as Muscat, Tokay, etc., should be pruned to spurs of two buds each after the main leaders have been trained over the frame work. Do not fail to leave spurs to grow low down on the main stems if you desire that the arbor give shade clear to the ground. Removing sprouts from positions where they are not needed helps to improve the utility of the arbor.

Practical Farm Science

HONEY.

Honey consists of the nectar of flowers elaborated by the bee and laid down in the cells of the honey comb. This is in substance the definition given in the dictionaries and recognized by writers on food products and food adulterations.

It is not uncommon practice to feed bees, when flowers are scarce, with sugar in some form to carry them along till they can get a full supply of nectar from flowers. But in order to lessen the work of the hive and so increase production, cane sugar is sometimes fed abundantly and continuously when it is not at all essential to the bees.

This cane sugar, more or less converted by the bees into invert sugar, is laid down in the comb; but according to the definition given above is not, strictly speaking, true honey—Prof. A. W. Ogden.

PROTECT THE BIRDS.

The protection of birds is fast passing beyond the stage of mere sentiment. The lover of the gun has for years had, in a great measure, the supervision of the game laws, which furnish some protection to the smaller birds, but almost none to those which are considerable edible or decorative enough to be of use to the milliner.

Among refined and humane women the Audubon and similar clubs have done much to change the sentiment in regard to the use of the skin and wings of birds as personal adornment. Some years ago I made the statement, which I have seen no occasion to retract, that "I have rarely seen a refined, cultivated face under a hat which showed that bird life had been sacrificed for its decoration."

The methods to be used in restoring to the fields, woods and towns the number of birds of former years is a task of no mean undertaking. In reframing the laws we can depend upon little or no assistance from the sellers of powder and shot, the pot-hunters or the boy with the sling-shot or his parents, or even from the true sportsman, who, as a rule, is fully as willing to see the farmer's crop shortened a little as to curtail his own pleasure.

Societies should direct their attention to disseminating information through papers to the farmers, who, though they receive the greatest financial benefits through the insectivorous and granivirous birds, are often uninformed as to their full value, who will wantonly shoot the birds in their cherry trees which have done much to save their other crops.—Dr. J. F. Bancroft.

POISON FOR GOPHERS.

Dissolve 3-4 ounce of strychnine crystals in 1-2 pint of hot vinegar, and after the strychnine has dissolved add one quart of hot water. Take 10 lbs. of clean wheat and pour the poison solution over it, stirring frequently so that all of the wheat will be poisoned equally. When the poison water is all absorbed pour the wheat out on paper in a room where nothing can get at it and stir two or three times a day until dry.

Next dissolve three pounds of sugar in 1-2 gallon of water and boil until a thick syrup is made. Pour over the poisoned wheat while hot and stir until cold. You will then have highly poisoned wheat that is sugar coated. When ready to use take as much of the wheat as will be used within a week and pour a rew drops of Anise oil in it. This will make an attractive odor and the gophers will come to it from a distance, but as the Anise oil is volatile it is best to prepare only a small quantity at a time.

It is best to put about 1-4 to 1-2 teaspoonful of the wheat in the runway, but if put in the ground close the runway the gopher will find it. It sometimes happens that the gopher will carry the wheat to his store but he usually eats it within a few days, if not at once.

Great care should be taken in handling such wheat. It should be kept in some place where there is no danger of birds or animals getting it, and in a tight can.—J. B. Neff.

THE METRIC SYSTEM.

A very prominent seed dealer says: "In our business we deal directly with the farmer and study his needs and wishes. I wish every farmer in the United States could have it brought home to him that the adoption of the metric system would save him not only endless confusion and vexation, but would also prevent his purchasing what he thinks is one thing but which very often turns out to be something entirely different. The widely different State laws as to what constitutes a legal bushel of seed make it possible for the unscrupulous dealer to take advantage of the purchasers.

"In Pennsylvania the legal weight of a bushel of grass seed is fourteen pounds. We pick out the chaff and dead germs from our grass seed, and as a result the actual weight of our bushel is from thirty-eight to forty pounds. All this has to be carefully explained in our catalogue to account for the difference in price of a bushel between our seed and that sold by dealers who do not take out the chaff.

"As another example take onion sets. We sell what we call a 'heaping bushel' of from thirty-eight to forty pounds, whereas the farmer ordering his onion sets from the West or South will receive as low as twenty-three pounds to the bushel for his money. There is such an utter confusion owing to the different legal standards in different States for the same thing that the farmer in buying his seed from various places has hard work to form any idea of what he is going to get. We have tried to remedy the matter in our own catalougue by quoting prices in pounds. If the metric system were introduced, however, the farmer could be sure of getting the same quantity wherever he ordered, for the standard would be the same throughout the United States.

"We sell twenty-three kinds of grass and grain seed and the weight varies from seven to thirty-two pounds per bushel. You can see how confusing the matter is. We are earnest advocates of the metric system and are immensely pleased to see the matter taken up by the press.

"The fact that half a kilo so nearly approximates the pound will make it an easy matter for the farmer to get comparative weights of the old and new systems.

"We have found the farmer of today ready to adopt any new method that will help him in his work and we feel sure that once he sees the advantage of the metric system he will throw his influence toward the adoption of 'one weight, one system' thro'-out the United States."

TREES

ROEDING TRUE TREES FRESNO, CAL.

True to Name

It is of the utmost importance that young trees, shrubs and vines for planting be true to name. They must also be well rooted and properly prepared for shipping and planting.

We have four separate nurseries, comprising over eleven hundred acres, in different sections of the country, each having its peculiar soil best suited to the special requirements of different trees, shrubs and vines for their perfect development. It is a costly method for us to pursue, but it enables us to grow the very best on the market.

CALIMYRNA FIGS

Over fourteen years of careful experimenting with the growth of the Smyrna fig, or fig of commence, in this country were required before we could say that we had been entirely successful in propagating this valuable fig, and for the past five years we have been growing this fig in its perfection, drying, packing and marketing it.

CALIMYRNA R FRESNO

There are several varieties of the Smyrna fig, but with our varied experience in this line we feel warranted in recommending one, the Calimyrna, as the most profitable and best for all commercial purposes. We are able to supply almost any desired quantity of these superior trees.

We protect the Calimyrna Fig with the seal shown herewith, which is attached to each bundle of ten trees.

We have this season a superior stock of

PEACHES, PLUMS,
PRUNES, PEARS,
APPLES, APRICOTS,
CHERRIES, OLIVES,
NECTARINES, ETC.

These trees are all grown in our nursery plant, No. 3, which has a rich river bottom soil, permitting the most perfect rooting . Our

ORANGES,
LEMONS,
POMELOS,
LIMES,
CITRON

And all of our citrus fruit trees are grown in our nursery at Exeter, which has a deep, rich, black loam and is particularly suited to citrus trees. All of the standard varieties will be found in our stock.

GRAPE VINES

As we are the largest growers on the coast of the best varieties of raisin, wine and table grapes and also make a specialty of vines grafted on phylloxera resistant roots, we are in a position to fill your orders most satisfactorily.

CATALOGUE FREE

Our catalogue, in either English or Spanish, is profusely illustrated and gives a good idea of the immensity of our stock. We mail it free to any address on receipt of 5c postage. Price list mailed on application.

BOOK YOUR ORDERS NOW

If you are contemplating doing any planting it would be well for you to place your order as early as possible. We will book your order now and ship your stock when it is desired.

Paid-Up Capital, $200,000.00.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

DECIDUOUS FRUIT PROSPECTS

An inspection of the many orchards in the northern counties indicates a good chance for the coming fruit crop. The blossom buds are rapidly maturing and are well swollen already. In most cases these are well filled out and give every evidence of an abundant crop, barring of course, unforeseen contingencies. Apricots alone will probably be light. Of this fruit there was a heavy crop last year, and we rarely have two good crops of apricots in succession. Very much damage has been done, too, by shot-hole fungus, which in many cases has weakened the trees and so lessened their bearing capacity. Last year there was a great shortage in the peach crop. This was due to some unknown cause, although the theory was advanced that heavy rains during the blooming period had washed the pollen from the blossoms and prevented proper fertilization. The trees blossomed well but the fruit did not set, and in many cases the blossom buds shrivelled up and failed to mature. This year, there is every evidence of a strong blossom season, to be followed by a heavy crop. The same is true of pears, and while the blight has done much damage with this fruit, there is still a sufficient quantity of pear orchards left uninjured to insure a very heavy crop in a good season, and such this promises to be. With the exception of the apricot, as noted, all other deciduous fruits so far promise well, and if the unforeseen does not happen, we shall have a very bounteous crop of deciduous fruits this season.

* * *

NO VINE QUARANTINE FOR TULARE COUNTY.

The vineyardists of Tulare County are very much worked up over the possible danger of introducing the Anaheim disease and Phylloxera into that county, from both of which it is now fortunately free. To protect themselves, the supervisors at the request of the vinegrowers, passed an ordinance prohibiting the importation of grapevines into the county from any section whatever. This has been pronounced unconstitutional by the Attorney General. A petition, very numerously signed, and expressing the general opinion and wishes of the people, was then prepared and presented to State Horticultural Commissioner Cooper, asking that he declare Tulare county a horticultural quarantine district, into which no grape vine cuttings could be admitted. The matter was again laid before the Attorney General, with the view to discovering whether, under the law, the Commissioner could do as requested, and the necessity for such action and the urgency of the case were explained. In response a somewhat lengthy opinion was rendered, giving many authorities and quoting law points in relation to the matter, the whole opinion being summed up as follows:

"The act defining your power does not seem to authorize anything more than a circumscribing of an infected district, and the eradication of the pests therein. But without deciding as to the full extent of your powers thereunder, such a regulation as that contemplated by the petition signed by the citizens of Tulare county would seem to violate the principles laid down in the above case.

In answering your communication therefore, I advise you that a regulation prohibiting the importations of vines from other sections of the State, whether the same be infected or free from infectation, into the said county of Tulare, would be unreasonable, and it would be necessary for you to designate the section in which infestation prevails, and prohibit the exportation of vines, tree, or plants, exposed to such infestation from such section."

* * *

AN ERRONEOUS STATEMENT.

The Santa Barbara Independent says:

"County Horticultural Commissioner L. T. Yates, in the course of his inspection of fruit that has been shipped into this city and county during the past few weeks, has discovered that many of the consignments of oranges have been affected by the Mexican orange maggot, which has been a source of much annoyance to growers and those who have been handling the fruit for a long time past. Although a quarantine has been established against the importation of infected oranges from Mexico, Commissioner Yates states that large quantities of the infected fruit have been shipped into California and that it has been quite generally distributed in the market in the southern section of the state in spite of the precautions that have been taken to enforce the quarantine regulations."

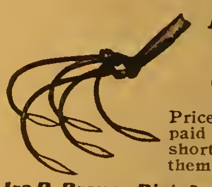
It is to be regretted that such statements as this find their way to print, as they are misleading and tend to arouse the fears of our fruit growers, when there is no necessity for it at all. We question very much whether a single Mexican orange has ever found its way into Santa Barbara. No Mexican oranges get into California without inspection, and inspection means destruction, as most or all of them come from the state of Guerrero in which the orange worm is known to exist. The Mexican orange maggot has never yet obtained a foothold in California, and it is safe to say that with the present system of inspection and quarantine, it never will, and Commissioner Yates is laboring under a great mistake in connection with his alleged discovery.

* * *

CODLING MOTH TIME.

In a very short time the apple trees will be in bloom and already orchardists in the apple sections are looking up their spraying outfits, preparing for the annual contest against the Codling Moth, and it is certain that good work must be done, if the grower would have any results for his labors. Often orchardists make the mistake of purchasing cheap materials and then wonder that the results are not more favorable. We know of no falser form of economy than the purchase of cheap Paris green for a campaign against the moth. The amount of the article used is very small, one lb. to two hundred gallons of water, so that a few cents saved on a lb. of Paris green is infinitesimal, while the waste, from this poor economy is very heavy, often the entire crop. So, before preparing the spray, every possible method should be used to ascertain that the Paris green comes up to the standard, and it should be purchased with the guarantee of some reputable house. It would be well to purchase the necessary amount early enough to have it tested, and this can be done by sending samples to the University at Berkeley. A few cents extra and a little trouble taken beforehand, may mean the difference between a crop of fruit and the loss of a year's labor and outlay.

The Earl Fruit Company recently sent a carload of apples to France, and the prices realized which are very satisfactory, are as follows: Four-tiers, $2.40 to $2.65; four and a half tiers, $1.92.



ADJUSTABLE GARDEN CULTIVATOR

Price $1.50. Sent charges paid on receipt of price for short time only, to introduce them.

With the Citrus Growers

BY J. W. MILLS

NEW THEORIES IN IRRIGATION.

Should the orange growers of Southern California go back to the old way of irrigating that was in vogue in most of the orange growing districts eight or ten years ago, there would not be much more than half enough water to keep the trees now under cultivation, on a growing basis. The furrow system has saved the orange growers not only water but expense in cultivation. There is one orchard of 700 acres in Riverside that has been pulled through with one inch to fifty acres for two or three years past. It is true that some of the orange trees are young, yet this is offset by two hundred or more acres being in full bearing lemon trees. The area this year was increased by over one hundred acres with no increase in the water supply. Had this orchard been irrigated by the old system of flooding the area could not have been increased but it would have been cut down considerable. The orchard wihch we refer to is part of the Arlington Heights property.

The superintendent of this large orchard has a new theory which he works in connection with the furrow system of irrigation. The object aimed at is to put the water down below the zone in which the roots naturally grow and keep that zone as dry as possible. This is to discourage the formation of roots near the surface. Mr. James Mills, the superintendent, claims that by running furrows close to the trees, the soil in the centers of the spaces running parallel with furrows, contains more moisture two feet below the surface when the next irrigation comes around, than does the soil near the trees. This being the case, there must be side percolation to a remarkable degree. There is one 20 acre tract of two year old trees which went through last summer with one irrigation. The trees made a splendid growth and some of them produced a few oranges. This however, is not so remarkable as was the case with orange trees of the same age at Pomona Station. These went through the entire year from the fall till the present time with not even one irrigation. Some of the trees have half of a loose box of oranges of fine quality. These trees were planted after the Reed system and irrigated after planting, in furrows. During the coming years, as the soil fills up with roots, the supply of water will have to be increased. Here is where we have to look for economy in the use of water and this is what has incited experimentation with new theories. The same theories will not work in different kinds of soils and here is where we can't judge by what our neighbor does, just what we should do. We know from experience that on most soils and on all which we have handled, that side percolation is not very active. It is most active on heavy soil. We fear that even if the practice of running water in furrows near to the trees, is practiced from the planting of the orchard, that as the trees get older, there will have to be an addition to the number of furrows. We have a theory, backed by experience that side percolation will be rapid enough when the feeding roots fill the soil.

IMPROVED CONDITION OF FRUIT GROWERS.

It was pleasant to note, at the late Fruit Growers' convention, the evidences of a better feeling in regard to the future of fruit growing in California. For several years past there has been quite a pessimistic feeling prevalent, at least among some of the members, and advice has been given to root up the fruit trees—usually the other fellow's—or at least to discourage further planting. This year while there was no advocacy of extended planting of new orchards, there was generally a hopeful feeling as to the future of the fruit industry in our state. This was undoubtedly due to the fact that extraordinary good prices have prevailed for orchard products this season and fruit men have done well, in spite of a shortage in many varieties.

AGRICULTURAL EDUCATION.

The intelligent prosecution of agriculture is essential to the very existence of civilized man, and especially important to the people of the United States. The great mass of Americans have no chance to learn the art of farming in a practical way, and great ignorance prevails, even in the rural districts, as to the best mode of cultivation to hold fertility in new soils and to restore the exhausted lands in older settled states, which ignorance is the cause of great financial loss and is leading to the abandonment of country life by thousands of our people and the return of primitive conditions over extensive regions, much to the loss of the nation in many ways; therefore, to give all American youths opportunity for practical training in agriculture, such studies should be taken up in the common schools, especially in rural districts.

Every thinking person approves the movement to extend and to systematize industrial education. It especially urges that practical training schools of agriculture and the simple mechanic arts be established among the rural population, so that every child shall be trained to love nature and to make the most of its resources for self-support and the upbuilding of model American homes. With such a system of rural education, the forests of the land would be restored and preserved, and a body of youths trained for citizenship that would make the progress and prosperity of the republic forever secure.

ORANGE TREES

Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County

Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.

E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Ange'es, Cal.

Orange Seed Bed Stock

I have some 50,000 fine seed bed stock for sale. These plants are good color and very thrifty. Absolutely clean and healthy in every way. I will make them caliper 3-16 of an inch and up to ⅜ or ½ inch. Owing to the large size of the plants the packing will necessarily bring the price above the ordinary price of common sized plants, but they will be sold cheap, and if you intend setting it will pay you to see this stock.

J. M. Baker - - - Glendora, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

AN EVERBLOOMING IRIS.

There is, around Los Angeles in limited quantities, an iris of the Germanica type that seems to be an everbloomer. Iris Germanica has been so crossed and re-crossed with other species that except for well known characters still present we might suspect some of the types of belonging to a distinct species.

Just at present other species and varieties are out of bloom, but this particular one is still throwing up large, healthy flower spikes covered with florets of a deep rich purple. Even the recent cold snap seemed in no wise to affect this persistent variety. It is a vigorous grower with long flower spikes making it very desirable for cutting. Our attention was first called to this everblooming type during the Los Angeles Flower show in November and we now have a bunch of blooms from the same plants sent in by a Moneta subscriber. It is remarkable to find an everblooming iris, but more particularly one that blossoms through our recent cold snap.

EUCALYPTUS FOR HIGHWAYS.

A most important family are the Eucalyptus; few of these are suited for street planting in cities, but for country roadsides they are especially good. Of those thoroughly tested, are Eucalyptus polyanthemos, blooming in winter with long pendant blossoms recalling mignonette, is one of the best.

Eucalyptus callophylla and E. ficifolia are fall bloomers, and E. [illegible]eroxlon var. pallida with beautiful crimson flowers blooms from January to April, and has a weeping silvery foliage. Individual specimens of E. corymbosa in full bloom make a sight not easily forgotten, and may prove useful for avenues. Many others such as E. cornuta, E. diversi-color, E. leucoxylon are well suited for country roads. E. microcorys is highly recommended in Australia and from the description and habit of growth, is one of the few kinds worthy of a place on the lawn as a specimen tree.

CHARM OF COUNTRY LIFE.

There is no place in the world which appeals so irresistibly to people of all kinds, at this season of the year especially, as a pretty well-kept country home. It need no longer be handicapped by the old time drawbacks. The rural free delivery brings the mail daily to the door, and there are so many other conveniences that the farmer of ten years ago did not have, that farm life is no longer the drudgery it used to be, but more of a pleasure.—F.

CANNAS.

Some do not succeed with Cannas as they think they ought, and it is all because they fail to observe some essential matters. To do their best, Cannas must have a light, deep and very rich soil. We have seen them at their very best in old, well-rotted manure piles; but they must have plenty of water; sprinkling them does no good. When you go to water the Canna bed, give it a soaking a foot deep or more, and do it once or twice a week in dry weather. Try this and see if your Cannas don't improve.

PLEASURES OF COUNTRY LIFE

In this age of hurry and worry, of hustle, bustle, rush and push, the concentrated energy of the average American is kept on the alert, in the great struggle for bread and butter with most of mankind and for gain for the big, round, shining dollars with others.

The desire to be able to give our children a fair education and to secure for ourselves a competency when no longer able to work, makes a just use of our energies commendable. But "all work and no play makes Jack a dull boy.," and we do not note the beauty of all about us.

But what are some of the pleasures of life in the country? Our lives do not appeal so strongly to the sympathy of our city cousins as they did a few years ago when we were forced into a state of isolation by reason of circumstances beyond our control. Today, with the daily newspaper delivered at our door that keeps us in touch with the whole world, and the telephone that makes it possible to be social with our neighbors, and in communication with the markets and business world generally, we are becoming so independent that we have no use for their sympathy and concern for our welfare.

First, and above all we have an abundance of pure air which ought to keep us in such health as will enable us to enjoy all of its pleasures which makes the real joy of living. Not that we are never sick, nor ever have headaches or backache, nor suffering any of the "ills that flesh is [illegible]" but with this chief blessing—heir to all kinds in its most perfect condition, and freedom from the excitement and confusion of the city, it is usually our fault if we do not have a fair degree of health, without which there is little pleasure in life anywhere.

Society in the country is not altogether free from evils, yet every true parent must take great pleasure in being able, to a great extent, to prevent outside influences from counteracting home instruction until the habits and characters of the children are so well fixed that there is less danger of contamination when they must go out for themselves.

If you are so fortunate as to have a home on the mesa, against the foothills, or in a canyon, and have a spark of love for the beautiful, your heart must be touched with the profusion of beauty in nature's great garden, from the time the first delicate flower of winter appears until the latest summer visitor has gone.

The great ocean of waving grain and grass with its countless shades and tints of colors, makes your fingers tingle with the desire to wield the artist's brush and send a copy of it to your city friends.

And what a pleasure to see your children run and romp unfettered by fashion's toggery, laugh and sing and shout, and so develop the muscles, strengthen the lungs, and build up a constitution that can bear the discipline and study of school without injury and take hold of work with zeal.

ELEPHANTS EARS.

Everybody is familiar with the Caladium (elephant's ear) as a foliage plant, but few have ever seen it in bloom. A magnificient variety has been introduced from Central America which is a fine bloomer. The flowers are shaped like those of the calla lily, and are from seven to eight inches long and about the same width. It is a little late to start it now, but we have seen grand plants from bulbs that were put out in the middle of June It must have rich soil and plenty of water.

In the Vegetable Garden

BY ERNEST BRAUNTON

CHILLI PEPPERS.

There are several varieties of chilli peppers, but only two are grown commercially in California. One of these, the bright red, called "The Long Red" having pods from six to ten inches long and pointed, is the best known, while the very dark cone-shaped chilli usually known as the Mexican chilii, is not so commonly grown.

Chillis are most successfully grown in rich sandy loam which does not form a crust after water has been run over it, but it is not best to grow chillis more than two years in succession even on the best of soils without fertilizing or plowing in a cover crop. The chilli roots are shallow feeders and draw heavily on the plant food near the surface.

Great care should be taken in selecting seed so as to have as few nonproducing plants as possible, as well as to have the most profitable plants.

The seed should be taken from that part of the field producing the best and earliest ripening plants.

The best location for seed beds is on sandy ground, as this warms earlier in the spring and there is less liability of "damping off" of the plants if there should be an excess of moisture. The seed may be sown in the last week of February in beds that can be protected from frost, as the chilli plant is very sensitive to cold. Seed enough may be put on so as to have about four seeds to the square inch, rake in lightly and then cover with about a quarter of an inch of damp sand which should be kept damp until the plants are well up. After this it is best to put on water enough only to keep the plants in a thrifty condition until they are about two and a half inches high when they may be transplanted to the field.

If "damping off" should begin to show in the seed bed, all the infected plants as well as those within an inch of them should be carefully taken out with a trowel and thrown away. It is best to select a new location for the seed bed each year.

Plow the ground deeply where the chillis are to be planted and harrow down well. Then have a common sled marker which will mark three rows at a time four and one-half feet apart. Plant three feet apart in the rows, making the earth firm around the young plants. If the ground is not thoroughly wet it is best to irrigate before planting.

Planting should be done as soon as danger of frost is past.

The cultivation should be with a view to make a ridge of earth, having the chilli plants in the center. This makes a convenient furrow for irrigating and keeps the water from standing around the plants, as standing water injures them.

Chillis being shallow rooted require water at frequent intervals after they begin to bloom and it is often necessary to run a small stream down the rows every ten days. Some kind of cultivating should be done after each irrigation until the plants are too large to allow a cultivator to pass between the rows. Chillis grow best when there are clear warm days and warm nights.

If the chillis are intended for drying the picking is not done until the chilli is all red, any green spots will be white when dried. If the chillis are wanted for canning they are picked while of a dark green color. The usual manner of drying is by running a twine through the stems and hanging in the air on a scaffold, but in damp districts the chillis have to be dried in specially made evaporators.

As much as 2400 pounds of chillis have been grown per acre, but 1000 pounds per acre is nearer the average crop. It will take about seven lbs. of red chilli to make a pound of the dried product.

The consumption of dried chillis seems to be on the increase and there is an increasing demand for green chillis from the canners. Chillis can be grown for about 7 1-2 cents per dried pound on good land where water is not expensive.—J. B. Neff, Anaheim.

POISONOUS FUNGI.

The poisonous effects of fungi are of two kinds: The irritant, which affect the stomach and digestive organs directly and show their effects soon after eating; and the narcotic, much more dangerous, which act upon the nervous centers and do not produce poisonous symptoms until after a number of hours, usually eight or ten. The irritant fungi are often recognized by their taste when raw, but the narcotic species are generally pleasant to the taste, or at least not disagreeable.

The following rules should not be neglected by the beginner:

(1) Avoid fungi when in the button or unexpanded stage; also those in which the flesh has begun to decay, even if only slightly.

(2) Avoid all fungi which have stalks with a swollen base surrounded by a sac-like or scaly envelope, especially if the gills are white.

(3) Avoid all fungi having a milky juice, unless the milk is reddish.

(4) Avoid fungi in which the cap, or pileus, is thin in proportion to the gills, and in which the gills are nearly all of equal length, especially if the pileus is bright colored.

(5) Avoid all tube-bearing fungi in which the the flesh changes color when cut or broken or where the mouths of the tubes are reddish, and in the case of other tube-bearing fungi experiment with caution.

(6) Fungi which have a sort of spider web or flocculent ring around the upper part of the stalk should in general be avoided.

THE FARM GARDEN

The farm garden probably pays better than any other land on the place. No figures have been collected to show of what value its products are, but in the census of 1890 full statistics for market gardens were obtained and from these the conclusion just stated may be argued. The average value of garden stuff to the acre was found to be $147.17, while for wheat the average was only $11.65. Later reports show that the average for wheat, corn, oats, and hay is $7.75 per acre. It seems clear, therefore, that market gardening is more profitable than farming. But the home garden must pay even better than the market garden, for it is not subject to the heavy losses incident to marketing perishable crops. Its products are used directly on the home table and there need be very little waste. It follows that the garden pays better than the field. A good garden will supply half the family's living, and when field crops show a balance on the wrong side it becomes a very important means of support.

TEXAN ONION TEST.

In the yield test of irrigated and unirrigated onions in Texas it was found that the actual cost of four irrigations given during the season was $11.50 per acre, and that the increased yield amounted to 18,820 lbs, over that of the unirrigated field. The yield of the irrigated plat was at the rate of 38,560 (or 676 bu.) per acre. In a test of nineteen varieties of onions, the Red Bermuda proved the most satisfactory and productive.

Vegetables, when well cooked, will be found substantial aids to health. With our nuts, fruit and vegetables we do not need strong meats, and the physicians are awakening none too soon to the necessity of advising rheumatic people to abolish the meat course and adopt that which is more congenial to our mild, and of itself, revitalizing climate, the fruit, nut and vegetable diet.

Public Abuses Must Cease.—In the business world a general reckoning is going on. Our country is new and many evils have grown up. Graft has been practically universal. The business world is doing much toward doing its own cleaning, but the president is pushing things along in an official sense. He is setting the example. No other man in the United States is so well fitted for the work the president is doing. It is almost providential that he is in charge at the present time. There is graft in the insurance world—in fact, wherever the business field is plowed, something is turned over that is in need of daylight. In the minor walks of business, owners and managers have eliminated graft. They have required their employes to be honest. Now the public is going to require that general honesty shall be extended to include those who are in charge of the business. It was a good thing to make the subordinate honest, and it will be a good thing to make the boss honest. For a long time railroad managers have exacted the most punctilious honesty from their subordinates. Nothing remains now but to cut off the graft higher up.

Private cars, refrigerator cars, stub roads and rebates (incidental to these stub roads) must go. Common sense has willed it and the public conscience requires it. Above all things discrimination must be discontinued and good service given.

Congress and the president have these matters in hand and the right thing will be done. There never has been any doubt about the result. The railroads have been more scared than hurt. After it is all over they will be glad that congress has taken action. No laws have ever been made to control railroads that have not, in the end proved to be the best thing for the property. The sooner railroading is made a legitimate business the better. This country is new and it will take some time for the vast business of railroading to be divested of all possibility of abuse. After the railroads are regulated, some attention must be given to regulating the commerce upon our rivers and lakes—now entirely unregulated. And after that will come the regulation of ocean steamship lines, in the management of which outrageous abuses are now practiced. The public should not weary of well doing until all abuses of the business world are remedied, so far as it is possible to do so by legislation.

It is undoubtedly true that the first important act to be adopted by congress, now in session, will be an act cutting off railroad abuses, prohibiting rebates, and making discriminations impossible. The Cultivator hopes that such will be the first act of the present congress.

Business is generally upon a cleaner and healthier basis in the United States.

* * *

The Walnut Industry—The growing of the English (rightly Persian) walnut bids fair to become one of the leading industries of the Pacific Coast. For a few years prices have been steadily advancing until during the season just past the walnut has proven to be one of our most profitable orchard crops; and this, too, in a year when our citrus fruits have brought prices little short of phenominal.

Doubtless, the same mistakes will be made as has been the case with all our fruit trees, more especially the olive and those of the citrus family; much land will be planted to walnuts that is totally unfitted to the purpose. The walnut industry has thus far been confined to Southern California and particularly to that portion known as the "fog belt." The English walnut seems to thrive best where not entirely removed from coast influences so that the greatest measure of success has been attained in those districts subject, at times, to foggy weather, and sufficiently warm and free from frost that no injury results from late spring frosts during the period when the walnut is in bloom.

As we go further north, into regions of colder or more frosty winters, the grower will doubtless do well to shun the standard sorts so universally planted in the south and confine himself to the French varieties, particularly those known as "late bloomers." Many cases are known, both in California and Oregon where walnut trees have made a wonderful growth, but have each year been rendered barren by severe frosts at blossoming time. There is no doubt that with careful selection, not only many parts of Northern California, but also in Oregon walnut-growing may become a profitable industry. Of late years the observant growers have become converts to the use of trees grafted on native walnut root. As before noted, the high and increasing prices have caused quite a boom in planting throughout this State.

* * *

Passing of McClatchie.—In the death of Prof. Alfred James McClatchie, which occurred in Los Angeles on the 11th inst., the people of the Southwest lost one of their best instructors in scientific horticulture. All that he wrote contained his best effort and among scientists he was known to be careful, painstaking, conservative, and the mistakes he made were fewer than generally falls to the lot of one who writes voluminously on technical subjects.

His was a keenly analytical mind;he was ever the scientist, and was able to give to the world a considerable mass of standard scientific literature in a comparatively short time. His writings consist of large numbers of press articles, many of which first appeared in the Cultivator, bulletins for the Arizona and California Agricultural Experiment Stations, and for the Department at Washington. Of the latter his best known and most comprehensive work was "Eucalypts Cultivated in the United States." In addition he published many bulletins in Southern California through the local Academy of Sciences, among them being "Flora of Pasadena and Vicinity," "Seedless Plants of Southern California," etc., etc.

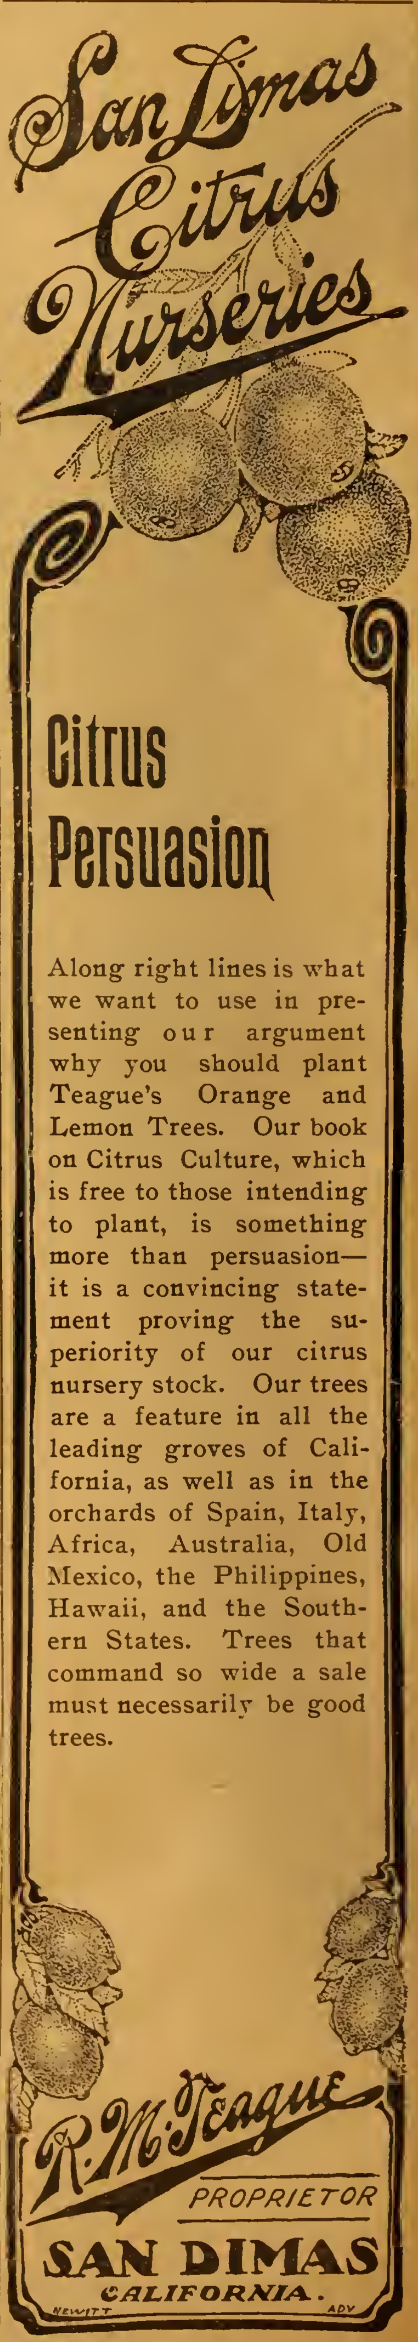
He was of a quiet, unassuming nature, rather inclined to shun the stranger, but to those who knew him best he was, at all times, a pleasing and interesting companion. It has been the good fortune of the writer to have met and visited with him many times and he was ever willing to give information and advice along scientific lines. The last visit made him, at his late home in Montebello, even when the hand of the Great White Plague was heavy upon him, found him cheerful and hopeful for the future. He will be more missed in scientific circles than any scientist ever in this section of the country and leaves, besides a wife and child, a host of friends to mourn his loss. His works will prove an enduring monument to a life of close application to scientific study and research.—Ernest Braunton.

* * *

The New State.—In the movement to divide Indian Territory considerable interest centers around the new state that will be formed. The name most likely to be chosen will be Sequoyah, in memory of the original possessors of the country. The capital will most likely be Fort Gibson as it is easy of access on the Grand River near the boundary line of the Cheroke county. Fort Gibson is the oldest town in the Territory, the government having established a military fort there in 1818.

There is a little interesting history about this place when the military post was in operation.

Among the officers who commanded there was Zachary Taylor who was afterwards President and Jefferson Davis who became President of the Confederate States. When Davis was a lieutenant he eloped with Miss Betty Taylor the daughter of the redoubtable General and they lived in a double log house which though in ruins is still shown. Henry M. Stanley the African explorer, taught school in a building which is pointed out as one of the land marks. Gen. Hazen, while residing there married Miss McLean who a few years later became the wife of Admiral Dewey. Washington Irving wrote his "Tales of a Traveler" while spending some time in the place, and in 1848 Henry W. Longfellow was so delighted with the scenery in the neighborhood, that he immortalized it in his "Evangeline."



San Dimas Citrus Nurseries

Citrus Persuasion

Along right lines is what we want to use in presenting our argument why you should plant Teague's Orange and Lemon Trees. Our book on Citrus Culture, which is free to those intending to plant, is something more than persuasion—it is a convincing statement proving the superiority of our citrus nursery stock. Our trees are a feature in all the leading groves of California, as well as in the orchards of Spain, Italy, Africa, Australia, Old Mexico, the Philippines, Hawaii, and the Southern States. Trees that command so wide a sale must necessarily be good trees.

R. M. Teague
PROPRIETOR
SAN DIMAS
CALIFORNIA.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The 14th annual citrus fair at Cloverdale will open on Tuesday, Feb. 20th, and will close on Saturday, Feb. 24th.

Redlands has shipped 950 carloads of oranges this season, as against 1440 carloads shipped up to this time last year.

The apple specialist having compiled figures for the past four years shows a shortage in the apple crop in every state in the Union.

The Riverside packing houses are getting down to work again. Last week the shipments of oranges and lemons passed the 200 car mark.

The first orange car special run east by the Salt Lake left Riverside last Friday, arriving at Provo, Utah in the quick time of 33 hours and 25 minutes.

Hon. Elwood Cooper is at the head of a company which is investigating a new process for arresting the ripening of fruit, whereby it may be shipped without refrigeration.

Nordhoff has a large orange crop ready to pick, estimated at 130 to 150 car loads, about twenty-five per cent. over last year's crop. A good crop is being gathered around Fillmore, Bardsdale and Sespe.

The acreage of strawberries in the Florin district is decreasing very appreciably, and persons on the ground and who have given the matter considerable thought incline to the belief that it will be one-fourth less this year than it was last.

The Santa Paula Chronicle asserts that lemons grown in the vicinity of Santa Paula are known to have better keeping qualities than those from other parts of the state, and the trees bear more lemons in the summer time than places farther from the coast.

The stockholders of the Santa Paula Citrus Association have about 100 acres of lemons now, and expect to plant about 70 more acres this year. The new acreage that will be planted means the employment of much more labor, more business and money for Santa Paula.

The Coachella Submarine: "Sylvanus Starrett left Sunday for Fresno to bring 100,000 rooted Malaga grapevines to the valley, which will be distributed to farmers throughout the valley who got in their orders early. From 500 to 600 acres of Malaga grapes will be planted in the valley this year.

In the vicinity of Cloverdale, thousands of acres of vineyards are planted, and at Asti the Italian-Swiss Colony has its large dry wine vineyards, winery and distillery. Here is situated the largest wine tank in the world, having a capacity of 500,000 gallons, blasted out of solid rock.

Mr. H. E. Collins of Los Angeles, who is shipping oranges to the Western Orchard Produce Co., of London, England, received returns last week from a car shipped from Riverside, Jan. 31st., which netted $1.50 per box. The fruit went through in thirty days, A second car was shipped from Nordhoff on the 6th of the present month.

A letter received from J. H. Arbenz now located at Ringsville, Texas, informs the Cultivator that in the judgment of the writer many of the California fruits can be grown in Texas. Mr. Arbenz, who is a nurseryman of experience, looks upon the state of Texas as full of promise in the developement of fruit and auxiliary conditions.

AGRICULTURE.

Martin Schields, a gardener and rancher in Antelope Valley, claims to have perfected a winter variety of watermelon.

The government is daily expecting a fresh supply of the deadly Danysz virus from France, with which to experiment in the control of the pesky pocket gopher.

The movement of hay in the state for the past week reached [illegible]00 tons. The Orange County peanut crop for the present year will amount to 200 tons harvested from 200 acres in the vicinity of Tustin.

The rainfall in Suisun Valley for the season is about ten inches, and the condition on the farms and in the orchards is quite favorable at the present time for the crop season.

The Coachella Valley Producers' Association shipped 187 carloads of melons last summer from Coachella. These melons were grown on 691 acres, of which 529 were at Coachella, 107 at Durbrow and 54 at Mecca.

At the meeting of the State Farm Commission, Professor Wickson of the State University recommended the purchase of the Burgess site tract near Walnut Creek, in Contra Costa county, twelve miles from Berkeley.

LIVE STOCK.

Corning, in Tehama county, is to have a new creamery.

The Pocket creamery a few miles below Sacramento, was burned down recently.

Sheep men are complaining of the depredations of dogs in the vicinity of Dixon.

A meeting of stockmen at Santa Cruz this week took steps to endeavor to checkmate the beef trust.

A cattle growers' association, with a membership of about twenty, was formed at Badger, in Tulare county last week.

Thousands of sheep are reported to have perished in the heavy storm on the ranges of Yuba county during the past week.

It is stated on good authority that a weekly stock train will shortly be put in service between the Imperial valley and Los Angeles.

Walter Butter, near Santa Rosa, has twelve incubators going. each containing 600 eggs and expects to hatch 40,000 chicks this spring.

Coyotes killed off so many hogs in the hills around Orosi, that men engaged in the industry of hog raising had to abandon the business.

Ernest Babcock of Casa Blanca is exhibiting a three legged calf born 13 days ago. The animal is strong and promises to reach a triangular maturity.

Chicken raisers in the Los Angeles section are expecting to see a second Petaluma arise, so far as egg production is concerned, at the little town of Inglewood.

The reports of the Santa Rosa Poultry Association and the Sonoma county Poultry Association, show that during this last year they each handled no less that $25,000 worth of eggs.

One of the fruits of the great irrigation movement in the vicinity of Winters is the plan of sixty-five of the farmers in that section to establish a co-operative creamery in that town.

The entire dairy herd of the Napa State Hospital, consisting of over eighty head of fine selected cattle have been poisoned by some person. On Sunday, a week ago, the whole herd suddenly became sick and all gave evidence of being in great agony. Four cows died and several more are expected to die. The drug used was probably arsenic, placed in the water or food.

MISCELLANEOUS.

A new bank opened at Santa Paula on the 5th inst.

The new town of Corcoran is about to build its first church, Presbyterian.

The contract has been let for the construction of a railroad between Vacaville and Winters.

Articles of incorporation of the Holy City, the New Jerusalem, were filed in San Jose last week.

The season for shooting valley quail, ducks, ibis, curlew, plover and rail, closed yesterday, (Feb. 15.)

The city of Napa has placed a new bell, weighing over a ton, in the court house tower in that place.

A shipment of 1,000,000 salmon eggs to New Zealand was made last week from Tehama by the Mill Creek Hatchery.

Porterville has just organized a live improvement association, looking to street planting and the embellishment of their high school grounds.

There is to be a twelve-foot tunnel from Alameda county, under San Francisco bay, to the shores of the peninsula for a great water pipe.

The 16th annual convention of the California State Beekeepers' Association will be held in the Chamber of Commerce, Los Angeles, Feb. 20-21.

Many handsome homes were built in Glendora in the past year. The amount expended in residence construction alone doubles that of the previous year.

Among the improvements contemplated at the station of Holt, situated on Roberts Island in the San Joaquin valley, will be a railroad station, a new warehouse of large proportions and an asparagus cannery.

The people of the eastern portion of Shasta county, and particularly in the fertile Fall river section, have started a concerted movement to form a county of their own with Fall River Mills as the county seat.

The City Council of Stockton, Cal., as a committee of the whole, decided to call for an election on the issue of $700,000 of bonds for municipal improvements, including a City Hall, electric light plant, street work, children's playgrounds, sewers and garbage disposal.

The State Board of Lunacy has authorized the manager of the Stockton State Hospital to proceed with the improvement of the farm two miles north of Stockton that was purchased with funds appropriated by the last Legislature. The first work will be to level and put in 175 acres of alfalfa. The balance of the farm will be used for stock grazing and general farming.

Says the Imperial Press: "The party to take up the work of making a geological survey of the Salton basin arrived in Imperial last Thursday. They will be joined by other parties and expect to complete the work in three months. It is supposed that this work is done just at this time to furnish accurate data to the United States Government concerning the damage done by flood waters both in Imperial and by the overflow now flooding the Salton basin."

A Big Seed Offer

Convincing Seed Buyers of the Quality of : : :

Taylor's Seeds

Try Seeds First, Then Send Money

In order to introduce our seeds as rapidly as possible we will, upon request, send one each of our specially arranged collections of choice vegetable and flower seeds. The quantities are proportioned and selected to give a continuous supply of flowers and vegetables of high quality throughout the season to those who do not care to wade through long catalog lists. So certain are we that they will give satisfaction, that we will send our collection of flowers, 14 varieties, and our vegetable list, 14 sorts, for $1.00, and wait for our pay until you have tested the seeds and proven to your own satisfaction that they will germinate and produce the results we claim. If they are not first-class you do not send us a cent, if they "make good" June 1, send the dollar.

You know we could not do business on such liberal terms if our seeds were not as represented. They are guaranteed true to name and the seed grown. Remember, we require no money in advance. Order today, using coupon below, and you will say it was one of the most profitable dollars you ever spent.

F. Gilman Taylor Seed Co.,
Box 27, Glendale, Cal.

Please send me prepaid one each of your vegetable flower collection, If they grow satisfactorily, I will pay you $1.00 on June 1st, 1906. If not satisfactory, it is understood that I am to be at no expense whatever.

"Greatest Sporting Goods House"

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

DEHORNING CATTLE.

As I have five letters on hand referring to this important subject, I think it may be well to take it up more fully, as the time to dehorn is at hand, when the grass is good and before the filies become bad. Nearly every month the newspapers tell of some one being gored by the trusted and gentle dairy bull—that fantasy of the brain, the gentle bull—that in a paroxysm of rage has turned on his attendant, the only gentle bull to be trusted is the dead one, and the better his breeding the worse his temper. Over every dairy barn the following should be posted, "Treat the the head of the herd well but beware of his friendship." It is often asserted that the muleys have injured their keepers and the men have been knocked down by them, but it is rare compared to the number that have suffered by the sharp horns which catching in the clothes and throwing the victim down, and tossing him around, the hornless animal is powerless to do more than roll and bump the prostrate man around on the ground, I have often seen the men here, on the ranch when a dehorned bull rushed at them ,stand until he almost reached them, then jump aside and be in a place of safety before he could turn and come back at them.

It has seemed to me that in many cases, the head was more tender when the animal was dehorned than when it was in nature; that it feared to use the head to butt like a real muley, though this may not be true except in a limited number of cases. I have often laughed to see a gay little yearling with the short little spikes of horns chasing the great fellows weighing nearly a ton around the pastures.

A Dehorned Thoroughbred Holstein.

While the males are dehorned for the sake of the men handling them, the cows are dehorned for sake of peace, so the same poor cow will not have to take all the punches and knocks, the herd eats and drinks and sleeps quietly, one cow cannot stand by the trough and keep all the rest from drinking, nor block the door into the barn, by threat of sharp horns.

The age at which to dehorn has to be considered. For a time the calves were dehorned with caustic potash when a week old, but the men thought it checked the calves growth, I did not think they could be right, so we tried it, by weighing the calves when dropped and taking them turn about, dehorning every other one, at the end of each week they were weighed, the dehorned ones lost in weight and were always behind the others until they were turned out to grass, some lost the week they were burnt as much as ten pounds and did not start to gain in weight for four or five weeks, while others that were not dehorned gained steadily. The horns are now removed from the heifers after they have had their first calf, if they are shaped so that they can use them for hooking. The bulls are dehorned at maturity. Personally I have never removed yearlings' horns as I believed the head bones might not be hardened enough to stand the clippers. I have been told by two men in different parts of the State that they had had losses in cattle of this age when dehorned. Our veterinary here has not met with any losses in his work for us, but he thinks it is because we use sterile tools and are insistent on the men that help doing good, rather than quick work.

The use of the saw is barbarous, and inflicts much needless pain. There are a number of dehorning clippers on the market, those that I have examined seem to be of sufficient strength to do the work quickly and well. As two of the correspondents ask for the name of ours, I will say it is the Keystone bought fifteen years ago in the East, and from the maker, a man in whose little shop my pony used to be shod when I was a child in spending my summers on the farm in Chester county, Pennsylvania, when I saw his advertisement I bought of him rather than of a stranger.

The cows are driven into a corral in a bunch and one at a time are let in at the gate of the dehorning yard, the chute is out of sight behind a barn and after the cow is dehorned she is passed on into another field also out of sight of the waiting herd. The wilder cows and the bulls are dehorned in the chute, many of the cows need the clips in the nose to control them. After the animal is in the chute, the stanchion at the end is closed over the neck, one man steadies the head, while a second does the clipping and a third takes charge of the tools used. The clippers have been previously sterilized and cleansed, are taken from a pail of hot carbolized water. The horn is clipped close, taking with it a ring in the skin, the other horn follows at once, the clipper is handed to the man and is cleaned before using it again. A small plumbers stove is employed to keep hot iron rods; these are simply old files that have been put into handles; if there is any spurting of blood that shows that an artery has been cut, it is at once sealed by using the hot iron as a cautery, if not the blood is wiped off and a piece of oakum is laid in the hole left and rosin sprinkled over it and the hot iron used to melt it to form a covering, this makes a scaled wound that flies cannot trouble. I used to feel badly, fearing the dehorning was painful, but now I believe it is only bad for the moment, like having a tooth pulled. The cows dehorned at noon show only a slight decrease in the milk and eat as though nothing had happened to them.

Prof. Carlyle thinks that in a few generations the horns could be bred off cattle altogether. I suppose though at present we are all too busy trying to increase the profits of the herd to stop to take up this. At first, it would be like the color fad in cows, a drop backwards. I can remember when white was a blemish on a Jersey cow. I have seen heifers sent by my uncle to the butcher from fine Jerseys because they were not solid colored. The time may come when the horns will be cultivated and shaped by scraping the side to which it is desired to have it curl, for every one seems to love a crumply horn, even children, in my day, were not to enlightened to say "The cow with the crumply horn; milked by the maid forelorn." The neighbors when they buy a cow want her good and want her handsomely marked and the crumply horn is regarded as a beauty mark.

BREEDING DRAFT HORSES.

There is one more line of work that I wish to mention and that is the horse.

California has acheived great reputation for her fast horses—runners, trotters and pacers. I do not wish to say anything against speed horses—they have their place. I like to see a good race. But the raising of fast horses is a special business. Every livestock farmer can raise draft horses—heavy or medium. James McNab of San Francisco, who has had large experience as a buyer, writes: "It is a fact that at the present time there is a great scarcitv of heavy draft horses in this State. I have been constantly a buyer of heavy horses for 30 years past in San Francisco; have always traveled throughout the State in that time looking for and buying stock, and I must say that at no time during that period have good draft horses been so hard to find as at the present time.

"I know of no opportunity in the stock business that affords such profitable inducements as that of raising heavy draft stock. Five-year-olds, weighing from 1700 to 1800 pounds, readily bring $300 each in the San Francisco market, and higher prices are paid for fancy animals.

"Good 1600-pound teams and over are scarce and sell for from $500 per span and upward. They are salable when five years old, and, unlike roadsters, trotters and thoroughbreds, need no expense in the way of breaking and training.

"The fire department in San Francisco has had the greatest difficulty in finding suitable stock. At the last price made of $285 per head, the contractor failed to fill the contract.

"Had California horsemen followed up the line of breeding in recent years with the same enterprise that was displayed up to about the year 1885, I believe they would have attained even greater success than they reached with the thoroughbred or trotter, and that the California draft horses would have been noted the world over.

"Let us hope that the renewed interest manifested by recent heavy importations of draft stallions will result in an effort to put the State in the proper line for the future as a producer of draft stock."

These two tubs of butter were made from the same quantity of milk from the same cows
36 pounds @ 15¢ per pound
74 pounds @ 23¢ per pound
U S U S U S U S U S U S U S

How was it done? Here's the story in the words of a plain, honest, hard-working farmer and his wife.

RAYMOND, NEBR., JUNE 6, 1905.

We had a water separator, and from twelve cows we made 36 lbs. of butter. The next week we used a No. 6 U. S. Separator and made 74 lbs. from the same cows in the same pasture without any extra feed. We made $10.45 the first week after using the machine. We are very much pleased with it, and could not do without it now.

JOHN NEYLON,
MRS. NEYLON.

Are *you* using any gravity method to skim your milk? If you are, a

U. S. Cream Separator

will do for you what it did for the Neylons. Think what that means—a considerable daily saving in the time and work of handling your milk—from ⅓ to ½ *more* butter than you are now getting, and *better* butter, too, that brings a *higher* price. You can't afford to put off looking into this matter another day—write us *now* for a free catalogue, which explains just what you want to know.

SECURITY
Stock Food
is sold on the honest plan of satisfaction or no cost. This is a straightforward plain talk and means just what it says.

Use **Security Stock Food** (glutenized) for growing animals; for fattening animals; for work horses; for milch cows. The Food won't cost you a cent if you can't see that **Security Stock Food** has saved feed, made quicker growth; kept your animals in better condition, given more milk, and made you more money. Write us if not satisfied and we will refund price in full. You are the sole judge. No questions asked.

For five years this guarantee has been on every package sold. It also covers Security Poultry Food, Lice Killer, Gall Cure, Colic Cure, Worm Powder, Calf Food, Heave Remedy, Healer and Rheumatic Liniment. *Security* preparations are sold by dealers in almost every town in the United States, who will recommend them highly and "back up" our guarantee.

SECURITY IS THE ONLY GLUTENIZED STOCK FOOD.

where mares could be substituted for gelding for work purposes. A mare will raise a colt, and, with judicious handling, will lose but a few days from the field. As has been said already, the demand for horses of this type is great and the prices obtained good.

FODDER FOR THE DAIRY HERD

The often uncertain conditions which obtain in California during the period when we should be feeding the best materials for the production of milk in summer, has led Dr. Cherry, a celebrated bacteriologist, to write an exhaustive article which we publish in part herewith, for the very excellent suggestions he makes. His object is to give a general view of the problem of foods and feeding, and to see what provision can be made bv planting crops which will be available for the coming summer. When pastures furnish an abundance and variety of grasses, no better food can be found for the milch cow. But before ripening mixed grasses contain from 65 to 80 per cent of water, and a cow requires at least 100 lbs of such material in the course of a day if she is to yield a profitable quantity of milk. This amount represents two corn-sacksful, pressed down pretty firmly. As the grass dries it loses a great deal of its water, so that the same amount of nutriment may be obtained from much less weight. The cow finds it hard to obtain sufficient nourishment to keep up her own weight, without any surplus to spare from which she can manufacture milk.

For it must be remembered that the animal body is like a machine in this respect, that it is able only to transform the food materials into other forms of energy or into different chemical substances. It is no more able to create within itself the power of doing work or of secreting milk than a steam engine can keep on running when not supplied with wood and water. The food of the steam engine consists simply of carbon and water. That of the animal is more complicated. Water and carbon it must have in abundance, but the carbon is useless for the purposes of life in the form of charcoal. It requires to have been first of all worked up by plants into the form of starch and sugar, or of oils and fats. But the animal differs totally from the steam engine in this respect. Not only must it have the foods already mentioned, but others still more costly and complicated must be provided. This class of foods is called protein or albumin, and is found to consist of not only carbon and water, but also of nitrogen and traces of phosphorus and sulphur.

* * *

Chemical composition of foods.—Wherever life of any kind exists, whether it be in the form of plants or animals, the above classes of chemical substances are always found. However different a plant may be from an animal, the difference is due to the varying distribution of these materials, rather than to the presence of any distinctive substance in either plant or animal. Speaking roughly, plants are distinguished bv the preponderance of carbon, animals by the relative amount of protein.

Carbon forms the charcoal of the plant. It exists in the form of wood and fibrous materials, as starch and sugar (carbohydrates), and as oils and fats. Wood and fibre is generally too tough for the animal to digest and utilize as food, but the carbohydrates and fats form most important articles as food. They serve as fuel for the body, keeping up its warmth, and supplying it with much of the material for doing work. In the case of the cow they furnish a large part of the solids of the milk. For these purposes any given quantity of fat has a food value of two and a quarter times the same weight of carbohydrate. This fact explains the instinctive liking that all animals have for fatty foods in cold weather. The starch, sugars, and oils which are found most abundantly in seeds and fruit show that they are present in all parts of the plant.

Protein consists not only of carbon and water, but also contains nitrogen, and traces of phosphorus, sulphur, potash and many of the inorganic salts. Its distinctive feature is the nitrogen which it contains. Protein is the essential part of all living substances, and it is for its replenishment that nitrates, ammonia, sulphates, and phosphates are required in manures. Nitrogen exists in nature chiefly in the form of the gas which constitutes four-fifths of the atmosphere. But with some few but very important exceptions, plants are not able to make use of it in this form. They require to have it presented to their rootlets in such form as nitrates or ammonia salts dissolved in the water of the soil. The plant stores the nitrogen chiefly in the seed, and thus in the form of protein it becomes available as food for animals. The white of egg, lean meat, and the casein of the milk are examples of nearly pure protein. Blood, muscles, nerves, and organs, not only consist largely of protein, but they require this same substance, or others very like it, as food to make good the wear and tear of daily life, and to provide for growth and development. Hence protein is an essential part of the food of all animals. The plant, under the influence of the heat of the sun, slowly and laboriously manufactures it from the soil; animals eagerly appropriate it from the plant or else from one another, so that the struggle for existence has been well described as "The struggle for nitrogen." Every moment the living parts of our bodies are being worn out and renewed, and this renewal can only be effected by protein in the food. Protein is therefore, an essential part of every ration, and from what has been said it will be seen that it is the scarcest and most costly part of every ration.

* * *

Digestible and palatable.—But while the chemical composition of the food is thus fixed, there is another point of supreme importance. The food must not only have the right constituents, but it must also be digestible and palatable. The mere taking of food into the stomach is not sufficient to sustain life. The juices secreted by the walls of that organ must act on it, and reduce it to such a condition that the solid parts become dissolved, and are thus able to permeate the walls of the stomach and intestines and enter the blood. By the blood they are carried to all parts of the body to supply the food required by the working parts. The food must therefore contain a proper proportion of digestible matter. When the stomach is filled with a mass of dry, hard, unnutritious grass, leaves and straw, not only is the animal deprived of proper nutriment, but it cannot make use of the digestible parts of that which is actually present in the stomach. ,

* * *

Varied and Appetizing.—Then, also, the food must be varied in character and appetizing. We all know the effect upon ourselves of the way in which a meal is cooked and served, and the same holds good for all animals. The sight and smell of food, and the anticipated enjoyment of the meal are the chief stimulants to the secretion of the gastric juice. It has been shown by recent experiments that suitable food may be placed in the stomach of a starving animal, and no attempt will be made to digest it if the animal is not aware of its presence. In the same way the digestive juices will be secreted in abundance if the animal merely thinks he has swallowed food. He may be completely deceived on this point, but preparations for the digestion of the meal are made all the same. Hence successful feeding implies variety as well as quantity and quality.

Among the articles of green fodder recommended to be cultivated are alfalfa, vetch, Canadian field peas, barley, cow peas, horse beans, oats, rye, soy bean and sorghum.

In the vegetable line is recommended sugar beet, cabbage, carrots, parsnips, potatoes, pumpkins and turnips.

Hay, in the following articles, barley, oats and alfalfa.

These ingredients, says the author, "when combined in a balanced ration form the best feeds for best results, we can give the dairy cow."

Sharples TUBULAR CREAM SEPARATORS

Will you buy a bad separator because the agent is a "good fellow?" Some people do. They should read this.

If You Have a Brand New Separator
not a Tubular, put it in the garret. **We guarantee Tubulars to make enough more butter than any other separator, and from the same milk, to pay 25 per cent yearly interest on their cost. You test them free side by side.** Your decision is final.

Carnegie is using investments paying 6 per cent; here is a guaranteed 25 per cent to you. The waist low supply can—simple bowl—enclosed, self-oiling gears—are found only on Tubulars. Catalog T 260 explains it.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

FERTILITY OF EGGS.

At this season of the year, when it is all important to have fertile eggs, I may be pardoned if I continue the subject. It is well worth while to try one's best to have fertile eggs at this season, for next fall and winter eggs depend upon the pullets hatched in the spring. Last week I mentioned the proper food for fertility (it is the "balanced" narrow ration of 1.3) a few more words not calling it really the balanced ration, but "Nature's ration." Nature's food in the spring time would be plenty of tender green grass, clover, alfalfa or sprouting grain. You cannot expect fertile eggs without an ample supply of green food, an unlimitetd supply I had almost said. Nature also supplies in the spring after the rains an unusual amount of earth worms and larvae of insects. We must imitate Nature and increase our supply of animal food, but even Nature demands exercise. All her feathered children have to work, fly, scratch or run to gain their sustenance, and our imprisoned little friends must have exercise or their eggs will not be fertile. The exercise of scratching is more needed in the spring than at any other time, because it strengthens the organs of reproduction. Let a few hens get into your garden just when the seeds you have carefully sown begin to show their heads, or if you do not care to have such an object lesson, plow up or dig up their runs, and plant seeds, barley, wheat, oats, rape, lettuce, or anything you have and let the biddies do the cultivating. This will help the fertility more than anything and also greatly increase the egg yield.

I never give red pepper or stimulants of any kind during the breeding season. Stimulants are no more a food or a benefit to fowls than whiskey is a food or a benefit to a man. When stimulants are fed infertility will be noticed in the eggs and there will be mortality in the chicks that are hatched. In seasons when eggs show a large percentage of fertility, the chicks will usually be sturdy and thrive, whilst on the contrary, when the eggs do not hatch well, the chicks will be weakly and difficult to raise, will be liable to take cold and will readily fall a prey to any chicken epidemic that may be prevalent. In other words they will have weak constitutions. As I explained last week there are several causes for infertility of eggs, but the chief causes can usually be traced to improper food and lack of exercise.

* * *

In an Eastern poultry magazine I saw a letter on infertility. The writer asked if it could be possible that the use of blue stone in the water, as a preventitive or cure of roup might be the cause of the great infertility in eggs last season. Blue stone (sulphate of copper, is a poison, a very powerful germ killer, or else it would not kill the roup. Blue stone is the foundation of most of the roup cures in the market, which are to be given in the drinking water, and I think it very possibly may kill the delicate germ of life in the egg.

The fertility or infertility of eggs is an interesting and at this time of year a very important subject. People are very apt to jump to conclusions and to think they know all about it from one short experience. One man, for instance writes that infertility comes from the large number of eggs that hens now lay, quotes the wild birds as an illustration that their eggs are never infertile. This, however is a mistake, as I have found out myself in partridge and quail eggs.

Now as an offset to his theory, I had a hen called Snow Queen, that lived nearly seven years. She must have laid over one thousand eggs. I never knew one of them to be infertile. One of her sisters laid almost as many, all fertile, and another half-sister I think never laid a fertile egg. I had one hen I bought. She was a beautiful bird and I wanted to get new blood through her. I kept her three years. I set every egg and not one was fertile. These are merely interesting facts. One hen I had only laid four eggs in one month; none of her eggs were fertile. In all my years of experience and close observation and especially after using trap nests I found that my highest scoring birds were my best layers, and with the two exceptions I have named, my best layers had the most fertile eggs. My fowls were of the American class.

In the matter of fertility there is much difference in the different breeds. The Mediterraneans or the smaller, lighter, more active classes do not give the same amount of anxiety to the breeder as the larger, heavier breeds. This is one reason for the difference in the experience and opinions of fanciers, it is frequently simply caused by the difference in the size and activity of the breeds.

The comb is an indicator of much value in mating, especially among the larger, single combed breeds of Mediterraneans, and can help us determine the probabilities of fertility. It is safe to conclude that when the combs are shrunken or pale and flabby looking in either male or female the chances of fertility are poor. Breed only from the hens that are your very best layers and that are in vigorous health, and mate them to the best and most active male in your yards.

The old say, "The male is half the pen," should be remembered. Choose to head your pen of two year old hens, a good vigorous cockerel, the son of one of your best layers, choose one as near up to standard as possible. If you have not got one, buy a good one from a bred-to-lay strain.

When I was in the forest of Montmorenci for two summers, the nightingales sang all night and all day. "When do they sleep? I asked "Oh! Do you not know?" was the reply. "There are nightingales that sing only in the night, and others that sing only in the day. And the young ones inherit the same, the young of the day singers only sing by day!" A curious fact that was brought to my memory by seeing it asserted that if good fall layers are wanted the eggs should be incubated from hens that are from fall and winter layers. Please some of our readers experiment along these lines.

* * *

EDITOR'S QUESTION BOX.

Trapnests—Breeding. (E. R. P., Santa Rosa.) We have been readers of the "California Cultivator" for six months, and have received great help from the Poultry Department. I want to ask you to take up the subject of breeding. We are extremely new to the business of scientific poultry raising and have a very hazy idea of the terms. Line breeding: cross-breeding: in-breeding: breeding for utility: breeding for fancy, etc. Our chickens are White Leghorns,

AUCTION SALE

"OLD TRUSTY" INCUBATOR.

This is the Incubator that beat them all at the Poultry Show, Jan. 15th, '06. This is the Incubator that is outselling every other make today in Los Angeles. Just ***investigate,*** that's all we ask. Free trial to all, 30, 40, 60 days or longer. Send for the free book.

McCLANAHAN CO., LOS ANGELES, CAL.

and we want to develop a flock of heavy layers. I also want some help on the subject of "Trap-nesting." How do you do it? You mentioned the Maine Experiment Station nest as the best suited for the purpose and that the design could be supplied through the "Cultivator." I would very much like to have it.

Answer.—The trap-nest with the plans for making it was described fully in the "Cultivator" of January 17th, 1905. I have requested the office to send you one. If you were living near Los Angeles I would advise your sending to Henry Albers, 315 South Main or to S. H. Church, 503 South Main st, for one of the nests already made, then you could copy it. It is exceedingly simple and easily made. I made them myself from the description. The lid or cover, (a simple bit of board) is not given in the description, just the nest part.

To develop a flock of good layers, hatch **only** the eggs from your best layers. Like begets like. If you want to have hens that lay in the fall, hatch eggs from your best fall layers. If you want hens that lay large eggs select the large eggs for incubating and so on. You can get just what you want by careful, watchful work.

I will follow your suggestion and talk about breeding which is indeed a most interesting topic.

* * *

Trap-nests.—(J. C. H., Newcastle.) I see in the "Cultivator" you state you gave plans of a Government expert on making trap nests. I was sick for some time and must have missed it. Would you please have it published or send me description through the mail. Am afraid I am asking too much, but am very anxious.

Answer.—The plans and description of the best trap-nest that I have ever seen, because the simplest and easiest made and that does not alarm the hens, was given in the "Cultivator" of Jan. 17, 1906. It can be sent from the office or if sufficient of our subscribers ask for it, I will print it again. See reply to E. R. P.

UNWISE METHODS OF FORCING HENS.

The desire of many poultrymen when their hens first begin to lay, is how to force them to lay without ceasing, and as the eggs cannot be produced from nothing they conclude that the more food the more eggs; but that is just the rock upon which so many are wrecked, for the forcing process does not limit its operations in any one direction. In forcing the hen for eggs she is forced to do many things that are not desirable. She may be forced to become too fat or diseased, or to be utterly worthless for any one purpose whatever. Her capacity is limited, and when she is driven beyond that capacity she breaks down entirely. No hen can be forced to lay eggs. Nature gives her a certain period of time during which the eggs are developed. It is not difficult to supply her with the needed elements for this purpose, and any surplus bestowed will only be a waste, for if she cannot divert the materials to the production of eggs she will either void them or lay them up in the storehouses of her body, as fat, and will then become utterly unfitted to perform her functions thoroughly as a producer of eggs. There are many methods by which persons try to force hens to lay. One will put red pepper into the food to stimulate them, not being aware that red pepper has no more influence on the generative organs of the hen than so much sugar or salt, and the stimulant effect derived is merely imaginary. In fact, red pepper is cooling to a certain extent, and its pungency is but temporary. Another believes in putting tonics in the drinking water, believing that they are helpful, and tonics are composed of nearly all substances, many of which are rank poisons, such as copperas, tincture of nux vomica, etc. Even the well known Douglass mixture is swallowed by the hens with the water they drink to assist them in laying eggs Yet when the hens succumb to the several effects of the nostrums they are condemned as not being hardy or the difficulty is attributed to some disease which calls for more nostrums. If a hen is healthy and has a good appetite the nostrums cannot improve her. Eggs are not produced from powders, pills or solutions but from the food. A healthy hen is no subject for medicines or tonics If she is sick or drooping it is not out of place to assist her to regain her health with a tonic, but as long as her comb is bright and red and she scratches and works vigorously enjoying her food and laying eggs as fast as nature permits, the use of stimulants or tonics will not benefit her or enable her to lay another egg more than she would without their use, even if they do not injure her.—

HOW TO CLEAN EGGS.

Regarding the proper method of cleaning eggs, a New Jersey poultryman says:

"Eggs all of one color and perfectly clean make an attractive appearance and will readily bring several cents more per dozen than a dirty lot, particularly when quality goes with appearance, and the one is generally an indication of the other. An egg is improperly cleaned when it is wet too much and not rubbed dry with a dry cloth. Some when they see spots of dirt on eggs, put them in a pan of water and wash them like potatoes. There is, on the freshly laid egg, a mucilaginous covering which gives it a velvety appearance peculiar to new eggs. Water removes this, making the egg have an older appearance, and destroys its keeping qualities, as this covering makes the shell impervious to air. An egg, then, if it is not much soiled, should merely be moistened where necessary, and rubbed dry. If the blemish is in the nature of a stain, a little powdered scouring brick will help, and if this is not effective vinegar may be used in addition. In this way any stains may be removed from an egg. Sometimes they have to be put in water, but do not do it unless it is necessary, and then rub dry afterward. If this is not done they will look soiled and dingy. Eggs should be collected three or more times a day.

LOOK AT 'EM.

A woman said to us the other day, "I can't succeed at poultry raising." Why not? I asked, look at the women all over California who have made a success of the poultry business. Mrs. Basley, with her chickens, or Mrs. Sherman with her dairy and vineyard are examples of what a woman can do who tries to succeed. It's all in grit and knowing how.

Buff Plymouth Rocks

A few fine cockerels $2.00 to $4.00 each. Eggs, $2.00 for 15. Very choice Eastern stock.
F. W. Tutin, Riverside, Cal.

Rhode Island Reds

Fine stock of cockerels and hens for sale. Eggs, $1.50 per setting.

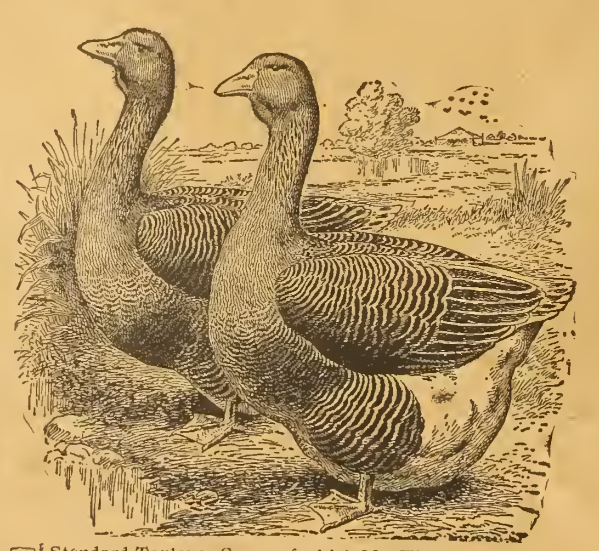
RAISING TOULOUSE GEESE FOR PROFIT

A few generations ago the breeding and raising of geese was one of the commonest branches of poultry culture in this country. And why people don't follow it more now is a question I will submit to answer. It must be that so few know the profit that can be had from a flock of geese.

I have had great experience in the poultry business and until I started raising geese a few years ago "experience was my only profit.

There has been greater improvement in the Goose family than in all the fowl kingdom, but I will take up the goose where we find him to-day, the wisest and most cunning, as well as the hardiest and most profitable member of the whole poultry world. And when we think of the many benefits derived from a flock of geese; the flesh, I can say without fear of contradiction, is of the very best, the feathers are used for beds, the quills are used for writing-pens and tooth picks, the down is used for pillows, and the grease is used by nearly every doctor in this country. Most of our grandmothers used to think there was nothing quite as good for children with a cold as goose-grease.

The best way to start a flock of geese is to get a pair of old ones, as it is the best and cheapest, and by far the most satisfactory. My geese begin laying late in January. I arrange some boxes and barrels with litter in and they find the places provided for them. Be very careful not to disturb the goose while she is on the nest. A goose will lay from 14 to 18 eggs, then she gets broody and wants to set. Shut her up away from the nest a few days and she will forget all about it, and go right to work laying again. I gather the eggs and keep them little end down in a well-ventilated room until I have enough to set a hen or incubator. If setting hens are used, keep them free from lice by dusting them with a good insect powder every week, and put from four to six goose eggs under each hen. After eight days test out. leaving four fertile eggs under each hen to hatch. Goose eggs should be sprinkled every fourth day after the twelfth one, in damp or cold weather with warm water 103, in hot, dry weather float from one and a half to two and a half minutes in warm water 103 degrees.



⊏⊐[Stondard Toulouse Geese, of which Mr. Higgins has one of the largest flocks in the State.

If incubators are used, float instead of sprinkling, the last float just before or when they pip, holding the pip up so as not to fill the shell with water and drown the gosling in the shell. If the gosling remains in the shell and dries, he should be helped out. Break away a little of the shell and if the inside lining does not bleed he is ready to come out. Wring out a cloth from water as hot as you can bear your hands in, wrap the egg in the cloth and leave it for a few minutes. You will find the gosling will come out bright and clean. Keep the goslings warm till they are dry and can run around. When they are 24 hours old, put them in a box, the bottom covered with sand, and feed often with a crumbly mash of one-third corn meal, to two-thirds bran. They are very easily raised, and no other young in the whole tribe of domestic poultry is so up-to-date and helpful as a young gosling, and given a tender grass plot, and a little warmth, he goes merrily on his way, nipping a living and asking favors of no one.

Geese are turned out to pasture just the same as cattle. Their bills have serrated edges which enables them to graze. Grass is the most important of all foods for young goslings, thereby costing very little to raise, and they grow as by magic. I use a stall in the barn as a brooder, keeping the goslings in a box at first with an old carpet thrown over it.

There are some things about raising geese which can be learned only by experience, and a little practice is worth a world of theory. Toulouse geese need good fresh water to drink at all times and none to swim in. You should arrange the drinking fountain so the goslings cannot get all wet, and not allow them to swim in any pond or stream till after they get a coat of feathers. But the drinking vessels should never be empty.

Geese need no warm houses in Southern California. An open corral is much better, where we have no severe winters, and the grass is green all the year. They will do well and stay in good condition the year round. So the cost of keeping them is simply the value of the grass they consume. Through the laying season in addition to grass, I feed a handful of rolled barley or wheat, and at all times keeping plenty of coarse sand where they can get it.

Toulouse geese are not subject to sickness, vermin, diseases of any kind. Barring accidents I raise all I hatch, when six or seven months old or at maturity, you can usually, by observation, tell the ganders from the geese. The male, in most cases, grows some larger than the female, the goose is deeper in the body, a trifle slimmer in neck and smaller in head. The call of the gander is loud, long and shrill, while that of a goose is merely an answer to it. Separate a flock by driving part of each side of a fence or building and you can distinguish most of the ganders by their calls. Never look for a curled feather in the tail or any outside marks

Standard Bred S. C. White Leghorns

EXTRA LARGE BIRDS AND HEAVY LAYERS. Eggs, $2 per 15; $8 per 100; $60 per 1000 from January until July only.

YARDS—CORNER MOORE AND CHAPMAN STS.

such as I have seen in some cuts, for there are none. Early in the spring it is easier to tell them, by teasing them, but it must be understood and done with care.

Geese live to a great old age, but are not profitable to raise in confinement, they must have a pasture where the year round they will live almost exclusively on alfalfa, grass or weeds, needing little grain, and thriving well. When geese are in proper condition they will lay from 36 to 50 eggs in a season, and under favorable condition the eggs should all hatch, say you raise 35 goslings up to an average of 12 pounds each at a cost of raising of six cents per pound, and sell them at 18 cents per pound, leaves you a nice profit of over $50.00 and you still have your pair of old geese. Show me anything on the farm that will come up to this with as little trouble, and I am using the lowest figures as my geese brought me a little over 20 cents per pound last year.

A great many people write from all over the State, asking about geese such as "are they as profitable as chickens," "do geese do well in Cal." and "what breeds are the best" (I hope none of them miss this issue of the Cultivator.). Toulouse are the only geese I have, and can not say as to other breeds, but I don't see why other breeds will not do as well as Toulouse. Southern California is the best place in the Union to raise geese in, as a small patch of alfalfa will feed a large flock of geese.

Any one can find ready sale for the feathers, at 75 cents to a dollar a pound, just let it be known in the city that you have good feathers for sale and you will soon find you did not have enough to go around.

Geese can not be raised in great droves like chickens and ducks by the thousands, "that gives a better chance for every farmer's wife!" to make a few dollars for herself, she can raise quite a flock in a season and make it pay, have no fear of glutting the market, green geese always find a ready sale, and there is a good demand in the fall and winter.

There is still much to be said about Toulouse geese, and a wide field open for discussion. I have only begun to tell you the good qualities there are in geese, saying nothing of the pleasure.—Hugh O. Higgins, Riverside, Cal.

WHY NOT BREED FOR EGGS.

It is not at all an uncommon experience for flocks of a dozen or more hens, all well fed and in perfect health to cease laying entirely about this time of the year and so continue for a month or six weeks. A few days ago three gentlemen on a street car were talking hen talk. Two of them had not had an egg laid the last three weeks. The other with about twenty Barred Plymouth Rocks had secured three eggs during the week—only one hen was laying. All these were of improved breeds—two of the gentlemen kept barred Plymouth Rocks and the other White Wyandottes. The only way such cases can be accounted for is, that these breeds have been carefully bred and selected for standard requirements, and not for laying qualities, as the standard does not require laying qualities, but altogether external markings of feathers, shanks, beaks, ear-lobes and wattles. This egglessness of hens during November and December should be remedied, if there is a remedy, and there certainly is. Select as breeders the best layers and males from the best laying hens; breed for yellow legs and we get them; breed for white ear-lobes and we get them. Then why not breed for eggs?

RAISING TURKEYS.

Turkey raising has become almost a distinct branch of poultry industry and requires a location very different from that needed for chickens, geese or ducks. Turkeys, while thoroughly domesticated, still retain that natural disposition to roam, and for this reason it is impossible to succeed with them in small lots. They must have range, even when this is given them they are but little more troublesome than any other kinds of poultry.

A. E. Bourke, Pres. Phone Black 1211

PETALUMA, CAL., JAN. 1, 1906.
TO WHOM IT MAY CONCERN;

As the chicken raising season is at hand, we beg leave to call your attention to a few of our specialties.

Do you need an Incubator? Our machines are fully guaranteed and have proven themselves unsurpassed wherever used.

Do you need Brooders? We manufacture just what you want; fully guaranteed, made of the finest material and of the best possible workmanship, and, above all, a practical machine which saves the purchaser money, time and labor.

Do you need Poultry Supplies of any kind? We manufacture a line of Supplies the use of which makes Poultry Raising not only profitable, but a pleasure. Among our specialties are:

Our Water Fountains; our Self Feeder for Chicks, our Feed Troughs, large and small; our Lamp Fillers.

Our convenient Must Hatch Nest Boxes; our safe and sure Must Hatch Insecticide, our sanitary Must Hatch Disinfectant, our sure death Must Hatch Lice Exterminator, our Poultry Compound, a fine Spring and Fall Tonic.

In connection with the above list, all of our own manufacture, we can also furnish the following, which are indispensable to the Poultrymen:

The No. 128 Clover Cutter, the Enterprise Bone Mill, the Ohio Feed Cutter, the Banner Root Cutter, the Enterprise Feed Chopper, the Ideal Duplex Feed Mill, and the Farmer's Boiler.

Do you wish to make your own Incubator or Brooder? We can furnish you all the necessary parts for making an Incubator or Brooder, also plans for the best and most practical Poultry Houses.

Did you ever purchase Just Hatched Chicks? We have a Hatchery of 50,000 chicks per month capacity in operation the year round and have, for the past few years, been successfully shipping, in our specially constructed carriers, just hatched Chicks, to distances as great as 2,000 miles. If you need them, book your order early, as our future delivery list is rapidly filling up.

We can also supply White Leghorn hatching egg in quantities desired. If you have not already received our catalogue, write for Catalogue B, and you will find therein a more detailed description with prices, etc., of the above.

Hoping to hear from you in the near future, we are,
Yours Very Respectfully,
MUST HATCH INCUBATOR CO.

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

INDIGESTIBLE FEED

A year ago a neighbor of mine lost two horses. They had been turned out on filaree pasture. When taken up they became very ill with colic and could not pass anything. Both died, and when cut open a very hard ball of filaree grass was found in the intestines. The doctor said that killed them. Now there were many other horses and cows on the same pasture and none of them were affected. This year the same man turned another horse on the same pasture, only the filaree had not yet come above the ground, but there were horse beans growing. This horse died with the same symptoms and when cut open a hard ball of horse bean pods was found in the intestines. Now many people feed the horse bean straw and pods, and it does not hurt them. When the first two horses died there were no horse beans in the field. But the symptoms were so much alike that I think there must have been a common cause. There is an apple orchard in this field and it has been sprayed every season with arsenic, Paris green, etc. Now, if a lump of this were left in some spot in the field and the horses had eaten a little, would that cause the above symptoms and death?

Those horses died from infraction of the bowels caused by the filaree. In green, succulent state this is good feed, but after a time as it matures, the filaree becomes woody and indigestible, particularly to horses turned out when the grass is in that stage, while other horses that have been feeding on this pasture for some time before are not so likely to be affected. The horse that died from infraction of bean pods had not been accustomed to the feed. This caused indigestion impaction. If the arsenic or Paris green had been the cause, your symptoms would have been quite different—diarrhoea instead of impaction.—Dr. Oliver.

* * *

DISTEMPER

Some months ago many horses in this locality had distemper. Their throats became very sore and they could eat very little and could swallow no water at all for some days; could not get their heads below the level of their shoulders. After some days lumps broke out on their throats or near their ears. They coughed some. Some horses died. Is this the real distemper and what causes it.?

This is the real distemper. Answer No. 5 applies to this case.

* * *

STRANGLES

Several of my horses have lately been troubled with a lump on their chest, or just between front legs, or under body a little back of fore legs. It grows very large and is hard and very feverish. Seems to move up the neck a little. When lanced a great deal of matter runs out and the horse gets better. They are very stiff in front legs and look very sick before the lump is lanced. What is the cause?

Those horses had what is known as irregular strangles and should have good care and mashes kept warm and in well ventilated stable. Apply a stimulating liniment to swollen lumps and lance as soon as they soften up. This disease is peculiar to horses.

* * *

CHRONIC DIARRHOEA

Please give remedy for chronic diarrhoea in a horse. He has had it for a couple of years.

Have's horse teeth examined and dressed. You have chronic indigestion from not properly masticating the food. Mix dry bran and rolled barley, one third bran and two thirds barley.

* * *

WORMS IN HORSES

Please give a remedy for worms in horses.

Pulverized copperas is good for large round worms.

* * *

BAD TEETH

I have a horse which has a fever rash all around his lips. He is rather thin and does not eat well, although usually a great eater.—Watsonville.

Have his teeth examined. Give a spoonful of nitrate potash twice a day. Apply solution of carbonate of soda to rash.

* * *

WORMS

Editor Cultivator—I had a Scotch Collie puppy about three months old. Fed him bread, skim milk and some meat. He had a spasm or fit just as if he were poisoned. We cut his tail and gave him milk and butter, and he got better, and drank a dish of milk without being forced, when suddenly he fell over dead, about three-quarters of an hour after the spasm. What do you think caused his death? H. K.—Watsonville.

The cause of the puppy's death, I believe, was worms—Threadworm (Filaria Immitis.) These worms are found in the heart of the dog. Dogs with this disease often die suddenly while others linger and have excruciating pain.

CRAPES, CREENS AND LOQUATS

Continued from page 148

large while rye, barley and oats grow the rankest kind. Any information in any form I will be glad to pay you for. Is rape grown for plowing under and is it a nitrogen gatherer and a free grower?—M. C. Cole, Santa Ana.

You are asking for something that is hard to give when you ask for a grape that is disease resistant. Before he Anaheim disease struck the country the grape was considered remarkably free from diseases of a serious nature. We do not know of any variety that will pay better than Purple Cornichon in your part of the country on heavy land. The Advance loquat has given good returns in your section we are told. It is the largest and handsomest variety now on the market.

Rape is not a nitrogen gatherer but it is a rank grower on heavy soil. Yellow melilot is a rank grower and a good nitrogen gatherer. It is commonly known as sweet clover. It has a slight resemblance to alfalfa but has a yellow bloom and in an annual. March is the time when this plant gets in its best growth. Bush cowpeas will mature in 60 to 90 days. If planted late in May you would get quite a growth.

* * *

ASPARAGUS ON WET LAND.

Editor Cultivator: Will you please tell me through the columns of the Cultivator, whether or not sub-irrigated heavy sandy loam will be suitable for asparagus? The land is lying low and in irrigating season the water is three or four inches below the surface.

How far would you set the plants and how far apart in the rows, also, how deep would you set the plants and what is the best variety of asparagus? If the land is not suited for growing asparagus, what kind of vegetable is it best suited for?—J. G. F., Fresno.

Asparagus should not be planted with the rows closer than six feet and the plants should not be closer than three feet apart in the rows. The crowns of the plants should be at least eight inches below the level of the surface. There are two reasons for this. When it is desired to cut white asparagus, it should not be cut less than three or four inches above the crown as it is always tough that far from the crown. Should the plants be set higher, it will require making the ridges higher which will necessitate removing too much from the roots and incur extra expense. Another reason is that, a shallow plowing just before the asparagus starts will destroy all the weeds and put the land in fine condition for the season's cultivation. This shallow plowing will cut off all the old stubs that are left from the past seasons growth. The crowns of the plants will be out of reach of the plow and the buds will escape injury. It must be remembered that asparagus grows out of the ground, that is, keeps adding to its height.

Your land does seem rather wet for most any kind of a crop, the wettest time being in the summer, but we do not know of any crop that will stand wet feet better than asparagus, though for early asparagus the water should be with held after the harvest season in order that the roots and crowns may have a rest and produce large shoots at the beginning of the season. If asparagus is allowed to grow and send up shoots all through the summer, the shoots will always be smaller than if it has a rest.

We would think that such wet land would produce good French artichokes. We would feel our way with this industry though, as the demand may be easily supplied. Judging from the prices they bring in the markets at the present time, they ought to pay well.

Conover's Colossal is the variety usually grown.

* * *

CUTTING THE EUCALYPTUS TREES.

Editor Cultivator: I would like to know the best time to cut Eucalyptus trees for wood so as to have the least risk of injury, that they may sprout and produce new tops with the least loss from dead stumps. My trees are mostly Blue Gums?—Subscriber.

The best time at which to cut Eucalyptus trees so as to insure the best renewal of tops, has not been definitely determined, but experience has taught us that Blue Gums cut away any time from December till March will send out plenty of shoots.

* * *

GREEN FEED IN THE WALNUT GROVE.

Editor Cultivator: Please tell me through your columns, what I can sow between my walnut trees which are on sandy loam soil, that will do the least injury and yet make the quickest and best feed for poultry. Is wheat good or could you suggest something better?—I. G. W., Tropico.

We would not plant wheat in any kind of an orchard. Nothing will sap the soil as fast as grain or grass. Half the area planted to alfalfa will give more and better feed, require no more water to keep the moisture supply up and will enrich the soil. In your climate, you will have green feed summer and winter.

"Sheds water like a duck's back"

An ideal roofing must be absolutely water-proof, practically fire-proof and alway weather-proof.

Rubber Sanded Roofing

Is proof against everything an ideal roofing should be proof against. Water flows off of it as fast as it falls. It is practically a fire-proof roofing—cinders, sparks or blazing brands falling upon it will burn themselves out, without injury to the roof. It is weather-proof in every climate. A building is warmer in winter and cooler in summer, than under any other class of roofing, because it is a non-conductor. Be sure to investigate thoroughly, that

Wear-Proof Surface of Clean Flint Sand.

"Pioneer" Rubber Sanded Roofing is put up in rolls—ready to lay and is easy to put on. A complete kit of roofing supplies is furnished with each roll. Our Booklet "D" will tell you all about the roofing question. Send for it today.

Pioneer Roll Paper Co., Los Angeles, Cal.

Queries and Replies

GROWING LETTUCE.

Editor Cultivator: Please tell me how to raise lettuce in the home garden? How can it be made to form crisp tender heads.

The soil is sandy and being an interior town, of course is hot and dry through the summer. Any information concerning the growing of our most valuable salad plant will be gratefully received by—J. H. S., Colton.

We have found that in addition to a loose friable soil, it is especially desirable to spade and work over the ground deeply for summer lettuce, keeping plants well watered, free from weeds, and the surface loose. Prize Head is especially recommended for sections like yours, but last year, near Los Angeles the writer had perfect mid-summer lettuce from both Black Seeded Simpson, and Denver Market.

GRAFTING WALNUTS.

I have planted around my place at 40 feet spaces eastern black walnuts. I put out some two years ago and some last year, nuts planted where I wish trees to grow, some are three feet high. When is the best time to graft or bud and which is most desirable. I wish to put the Franquette stock on.—G. H., Santa Rosa.

Grafting is usually done on one year old trees, but if they are only three feet high at two years old they can be successfully grafted at that age. The best time to graft walnut trees is just before the new growth starts. The scions sould be cut now and laid away in a cool place, packed in sand that is damp, but not wet, until wanted for use. Cleft grafting has been most successful, but if care is taken to have the inner barks meet and the graft is protected from the air as soon as placed in position by having a coating of warm wax, there is no reason why other styles will not be successful.

If the grafts in any of the stock should fail to grow let a shoot come in which can be budded in the last of August or first of September.

WITHOUT IRRIGATION.

Can you raise Egyptian corn, Kaffir corn, sorghum, potatoes, melons, or sugar beets and beets for feeding stock, on sandy ground like there is about Fresno, just from the moisture from the natural source, without any irrigation? How and when should each be planted.—A Subscriber, Fresno.

You may grow potatoes, melons and beets, without irrigation, but you should have water for the corn crops. If your soil is rather dry it may be best to irrigate potatoes, but if you do so let it be "early in the game," never after the first blossom shows.

SHEEP ON ALFALFA.

Editor Cultivator: How do sheep do on alfalfa and how many could be kept to the acre?—H. T., Turlock.

We do not know how many sheep an acre of alfalfa will keep because such feeding is not practiced. The sheep would do well much longer than the alfalfa, for they quickly kill it out.

A GOOD INCUBATOR.

The new management of the Stockton Incubator Co., are putting out a machine which is giving some great hatches. This machine has had many years trial with California poultry men and only a few months ago the writer was told by the poultryman in the central part of the State that while he had two other makes alongside, the old Stockton hatched healthy chicks to equal any of them.

Messrs. Marshall and Barnes, the new managers are pushers and are getting their machines up to look well as well to give good hatches. These machines were awarded a silver medal at the Buffalo Exposition against the strongest competition.

C. Scheerer & Co., Los Angeles, are advertising their justly celebrated Vulcanite Roofing in the Cultivator and will be pleased to send samples and price list on application. Write them, mentioning Cultivator.

RELATION OF HANDLINC TO KEEPINC OF FRUIT.

(Continued from first page.)

ence of bruising the orange on its keeping quality. The orange is cut from the tree with a pair of shears or clippers. The orange and lemon crop of California amounts to 30,000 carloads annually. The losses from decay in transit are estimated at half a million dollars annually. These losses have usually been ascribed to the conditions in the refrigerator car service. We are not prepared to say what proportion of the losses in the orange are due to the conditions in transit—a considerable amount without question—but it is reasonably certain that the handling of the fruit before it is packed, the character of the package in which it is shipped, and the conditions ni which it is grown are important factors aside from the conditions in transit that influence the shipping and keeping qualities.

It is exceptional to find a lot of oranges with less than 15 to 20 per cent of the fruit showing mechanical skin injuries by the clippers in severing the oranges from the tree. It is not unusual to find 20 to 30 per cent injured in this manner. Other injuries occur from stem punctures, and still others from the machinery used in washing, brushing, weighing, elevating and sizing the fruit. During the early part of the season, that is, in January and February, when the weather in California and in the transcontinental trip is cool and the fruit is immature, the decay in transit is not a serious commercial factor. But later in the season, in March, April and May, when the fruit is riper and the weather warms up in California, the molds start into growth easily in the bruised oranges and continue to develop in transit, especially in the center of the packages where the fruit is cooled last, and in the warmer parts of the car. The decay in imperfect fruit in transit is determined largely by the weather conditions at the shipping point, and the temperature in the car during the first few days of the trip. When the weather is unusually warm and moist, the fruit enters the car in a hot condition and the molds grow with unusual vigor. But when the fruit enters the car cool, it may be refrigerated sufficiently before the molds start into growth.

At the same time, oranges in perfect condition physically seldom rot in transit even in warm weather. It is a question whether oranges would require refrigeration if the fruit was handled so as to prevent the rupturing of the skin. It is the practice of the best lemon growers on the Pacific Coast to ship lemons in the hottest summer weather under ventilation. The rots in transit in oranges can be reduced primarily by the grower and packer in the same way that decays in apples in cold storage are to be reduced. Perfect fruit is the keystone on which successful fruit keeping is based. Quick refrigeration is of equal importance in holding back the development of decay in fruits that are made susceptible by rough handling.

There is another phase of the question that needs to be touched upon as it throws some light on a common source of trouble in shipping and storing fruit. There is a wide variation in the care with which different pickers handle fruit. Of two orange pickers working side by side, one may not injure more than 2 per cent of the fruit while the other injures at least one-half of the fruit. There is a wide variation in the fruit of different growers taken as a whole. One lot of oranges in a packing house may show 5 per cent of injury, another 10 per cent, and a third 30 per cent. Similar variations will be found in peaches, apples and in other fruits handled by different pickers and growers. When the fruit of a community is pooled, it often happens that a car on arrival in New York shows an average of 10 per cent decay, while another car the following day of the same grade has developed 25 per cent. The shipper is perplexed by the report and is likely to attribute it to a false report on the part of the inspector. Such differences, however, are logical when the wide variation in the conditions of the fruit or different pickers and growers is taken into consideration. The first car may have come from a grower who delivers the fruit to the packing house with a minimum of injury; the second from one who handles it with unusual roughness. There may be an equally wide variation in the different boxes of the same grade, caused by the variation in the care of the different pickers. In the same way, an apple dealer who stores twenty lots of Baldwin apples in one storage room may expect a wide variation in the keeping of the different lots if the fruit has been picked and packed by different growers, or if there has been a variation in the length of time that elapses between the picking and the storing.

The conditions under which the fruit is grown, such as the character of the soil, the age of the trees, the method of orchard management, the geographical location, undoubtedly exert a wide influence on the shipping and keeping qualities of fruit. On this branch of the subject there is little definite information. We know that the texture and the quality of the fruit is influenced widely by the cultural conditions, and it is probable that the susceptibility to decay, the rapidity of ripening and other factors that influence keeping quality are likewise modified. The Bureau is carrying on investigations along this line.

There has been a gradual improvement in the methods of fruit handling and in the methods and facilities in transportation. No other country begins to handle fruit as carefully as our own. No other country can approach the refrigerator car service, or the fruit transportation service of the United States. None other has developed the fruit business to the extent of the United States. But the industry is in its infancy. The domestic and foreign markets are capable of enormous development. The extension of the industry will depend on the improvement in methods by which the fruit grower, the handler, the transportation and the warehousemen increases the distribution of the fruit over wide areas in sound condition.

VULCANITE
ROOFING

JUST THE THING ALL
THE YEAR ROUND

Non-conductive of heat and cold. Does not buckle—lays perfectly smooth. A material which is at once light, strong, durable and cheap, and at the same time water-proof, wind-proof, acid and fume-proof. Also used for covering outside of buildings, floors of warehouses, offices, etc. Requires no paint; is permanent and inexpensive. Comes in various weights.

Samples and price list upon application.

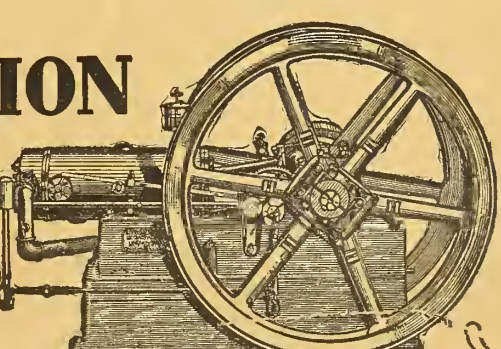
LOS ANGELES, CAL.



FOR
IRRIGATION
By
PUMPING

For all those who wish to irrigate by pumping, the I. H. C. gasoline engine is the one best power.

The difference between success and failure in an irrigation pumping plant is often a question of fuel.

The I. H. C. engines use gasoline—a cheap and easily transported fuel.

They take the least fuel and convert it into the most power.

They are unequalled when put against a steady load as in pumping, and sustain their full rated power with persistency and regularity.

They can be belted to any centrifugal or direct pump for lifting water from wells, canals, streams, etc.

Anybody can run them without expert knowledge or previous experience.

They can also be used as a general purpose engine for sawing wood, cream separating, feed grinding, etc.

They are made in several styles and sizes—

Horizontal and Portable—4, 6, 8, 10, 12 & 15 Horse Power.

Vertical—2, 3 & 5 Horse Power.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

Household Department

I CAN CLIMB.

At my needlework
I'm sitting
All intent on silken rose,
While my grayhaired dragon, knitting
Glares with spectacles on nose.
Locked and barred the garden gate,
Safely hid the garden key;
Tranquilly I bear my fate—
Thought is free.

In a trice today is banished,
Silken rose and dragon fade,
Prison bars and walls have vanished,
Once again I tread the glade.
Then forgot are space and time,
Fears and tremblings have flown—
For it's understood that I'm
Not alone.

So, although they guard securely,
Watch my face with jealous stare;
Though my needles fly demurely,
Yet my heart is light as air.
Little need to chafe and fret,
Nearer draws the magic time,
They have locked the gate, and yet—
I can climb.

Dr. Smile's Story.

Dr. Smile squeezed himself into the largest chair in the room and rubbed his fat hands preparatory to relating an experience. "Did I ever tell you about the people who were too good?" he asked. "Well, they formed one of those strange colonies which start to make what they think will be an earthly paradise. In this particular Eden the inhabitants were too modest to leave any record of themselves. I am, however, entitled to make a post-mortem statement, since I was present at the death of the community and ministered to it in its last moments.

"One day a tall, bearded farmer came in his wagon to get me to attend a case in his town. As I was a young practitioner without any practice I was delighted to respond. I was slightly troubled when the farmer asked me what my charge would be for attending a patient two weeks. I named a modest sum, and asked if he thought that excessive. "No," he said, "I think that is too little. Let us double the amount. 'And,' he continued, counting over some bills, 'we pay in advance.' "In that wonderful community, so I was told, they actually sent subscriptions to farm papers several years in advance."

"As we drew near the town our road became like a paved avenue, with never a stone or a mud hole in it and never a weed beside it. The fences in exactly regular lines, had no boards missing and were neatly painted. As we entered the town the houses seemed unnatural; the white paint was all unspotted; the windows everywhere had evidently just been cleaned, the door knobs were all highly polished, even the shingles on the roofs bore evidence of having been scrubbed recently. The grass in the dooryards must have been raked every day, the flower gardens could not muster a weed and the barns were just like the houses. The neatness of everything was growing painfully oppressive to me; I intimated as much to my companion.

"Cleanliness is next to godliness,' he replied. 'As we bathe twice a day and wash our clothing every alternate day we feel that our houses and barns should receive some attention.'

"Who makes such rules as these and who is able to enforce them on a whole town like this?' I asked.

"Said he: 'We need no rules. All of us agree about everything.'

"But,' said I 'what town officers could keep a road like this? Who is the head of your town?"

"We have no head," he answered. 'We have had elections, but no one was willing to be put in authority over his fellows or to take the salary of an office."

"Have you no physician of your own?" I asked, feeling hopes for the future.

"We had one," said he. "A perfect man. But for three months, when several of our people were down with one thing or another, he visited his patients all day without stopping for meals, and he sat up with the worst cases every night until one day the dear man dropped dead himself. He was a great example to our people."

"I found that my patient was the one black sheep in the flock. He was a fat, healthy fellow, who was thoroughly lazy. The good people, out of pure charity, forced themselves to believe that he was sick rather than indolent, and instead of tarring and feathering him as any other town might have done they paid a physician to attend him. He took me into his confidence at once; for he felt that his position was secure. He invited me to sit down with him to a sumptuous meal and related his history unblushingly.

"It might be a strain on your credulity to give further examples of the goodness of these people; how they sneaked up in the night to cut cordwood for their neighbors or dig potatoes for them; how they worked so hard that there seemed a likelihood of most of them dying of overwork in a few years; how they kept their hogs so clean that the animals all died young.

"Well, the end came rather unexpectedly. After I had visited my patient regularly for five days I found that the annual meeting of the town was to be held one evening in the hall. My patient said he might arouse himself enough to attend the meeting if I desired to go with him.

"Accordingly we went, sitting comfortably in the rear of the room. My companion prepared himself for a nap. The meeting opened with a long invocation; it grew so long that I nodded and was almost ready to follow the example of my patient.

"But in the midst of the prayer—perhaps at the end of twenty minutes—I noticed the odor of smoke and thought I heard the crackling of flames. I glanced about the room hastily. Except myself and my patient, who was snoring softly, every person had his head bowed and his eyes closed tightly. I leaped up with a shout, for there over the speaker's head the smoke was rolling in volumes and the woodwork was already afire.

"Then arose an unexpected debate. The men began shouting to one another to stand back and let the women and children out first; and thereupon the women and children, even to the little ones, not to be outdone, declared they would go last. Next followed a scene of confusion; the men argued with the women individually and pushed them toward the stairs, and the women answered still more vehemently and pulled the men toward the way of escape.

Williams' Shaving Soap

Williams' Shaving Soap "will not smart or dry on the face."

You know how common soap dries up into a scum—how it burns and smarts. You can avoid it all by using Williams' Shaving Soap.

COLONIST RATES TO CALIFORNIA

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leovenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearlo all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist leeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

"Then I remembered my patient. I shook him till he woke up. 'Are you as obstinate as these people about being saved?" I asked.

"Me?" said he, seizing me by the arm. 'Oh, Lord, get me out of here quick! All the gunpowder in town is just now stored in the basement. Help me out quick.'

"I started with him for the stairs. But the smoke was so thick and the confusion so great that I could not find them. At length I found a window and climbed out in order to pull my patient out after me. His head and his shoulders came through all right; then he stuck and with all my pulling and his kicking and sputtering he remained fast.

"Drop to the ground," he cried, "and run to the nearest house. Bring the ax you will find at the wood pile and come and cut this window frame out for me."

"I dropped to the ground and ran as fast as I could to the nearest house. Just as I reached it there was a great explosion. I looked about to find that the hall and all the people had been blown to atoms and only a great hole in the ground was left."—Chicago Tribune.

The Farmer's Wife
And the Telephone

When considering the advantages of a telephone on the farm, and whether or not to buy one, don't forget the wife. Of course the telephone is a "time-saver" for the farmer, it removes the necessity for so many trips to town, and gives him more time for work, but above all don't overlook the companionship it will afford the wife during the long day when the men-folks are away. It will be a protector to her and a messenger if occasion compels her to call for aid or assistance in a hurry. It will relieve the dry monotony of many a dreary day and drive lonesomeness away. The story is told of a line inspector, out in Illinois, who one day found a woman rocking and knitting, with the receiver of her telephone tied onto her head, so that she might hear all the conversation that passed over the line. That poor woman was not "nibby," she was just lonesome. Hundreds of farmers' wives know what it means to be lonesome — to yearn for companionship. Think what a relief the telephone will be to your wife, what a sense of security it will give her just to feel that she has the entire neighborhood right at her elbow when she wants them.

Stromberg-Carlson Telephones

are best for the farm, because they are always in order. They are made right, especially for such service, and they stay right. You can buy cheaper telephones, but they will cost you more in the end. They will be out of fix most of the time and will require constant attention to keep them "working" at all. To make your farm line both practical and profitable, don't experiment with cheap telephones. Buy only the best. We would like to help you to decide which is best; to do that, let us send you our new book, "How the Telephone Helps the Farmer," in which we illustrate and describe the process of making a farm telephone from beginning to finish, taking up particularly the most important or essential parts and showing how we make them and how the cheap fellows make theirs. This will be an object lesson to you that may save you a good many dollars and no little disappointment. It tells how to interest your neighbors in building a line, and will furnish valuable information you cannot afford to be without. It's free—write for it today. A postal will do; just say, "Send me 71-N," and it will come by return mail.

Cookery Recipes

NEAPOLITAN CORNSTARCH PUDDING.

Beat the whites of three or four eggs to a stiff froth. Dissolve two tablespoonfuls of conrstarch in a little milk and put it on the fire. When it begins to boil add the dissolved cornstarch. Stir until it becomes a smooth paste and add the whites of the eggs, letting it remain in the double boiler but off the fire, to cook them. Divide it into three parts, leaving one in the custard kettle. To this add an ounce of melted chocolate and a handful of small seedless raisins. Flavor part with vanilla and grated cocoanut. Color the third with green vegetable coloring and add pistachio flavoring, and a sprinkling of chopped pistachios or almonds. As fast as each is mixed turn into a round mold with straight up and down sides. Another pretty combination is to make a third of it coffee, in which case the coffee part should be made separately, taking a third of the other ingredients. Boil up the milk with a heaping tablespoonful of fresh coffee, strain through a cloth, and proceed as before. With this use chocolate, and have the middle layer pink, coloring it and flavoring with sherry. The small raisins are also good in the coffee layer, in which case use thirty sliced almonds in the chocolate and a few cut cherries in the pink. This is an inexpensive pudding to make, is delicious even without adding the fruits or nuts, and makes a showy desert surrounded with a circle of whipped cream.

* * *

Steamed Pudding.—Two cups sweet milk, 1 teaspoon soda, 1 cup molasses, 1 teaspoon cinnamon, 1 1-2 cups chopped suet, 1 teaspoon salt. Thicken with flour, not very stiff and steam 2 hours. Eat with milk, sugar and nutmeg.

* * *

Molasses Cake.—One cup molasses, 1 teaspoon ginger, 1 cup hot water, 1 teaspoon salt, 3 cups flour, 1 teaspoon soda, dissolved in hot water, 2 tablespoons melted butter.

* * *

Sauce for Salads and Cold Meats—Beat well four eggs, leaving out the whites. Mix together one tablespoonful of mustard, one of sugar, teaspoonful of salt, half a teaspoonful of cayenne pepper and a cup of vinegar. Turn into a pan and set the pan into boiling water. Cook until the consistency of thick cream. This, well bottled, will keep in a cool place sometime.

* * *

Celery Vinegar.—One quart of fresh celery, chopped fine, or a quarter of a pound of celery seed; one quart of good apple vinegar, one tablespoonful of salt and one of white sugar.

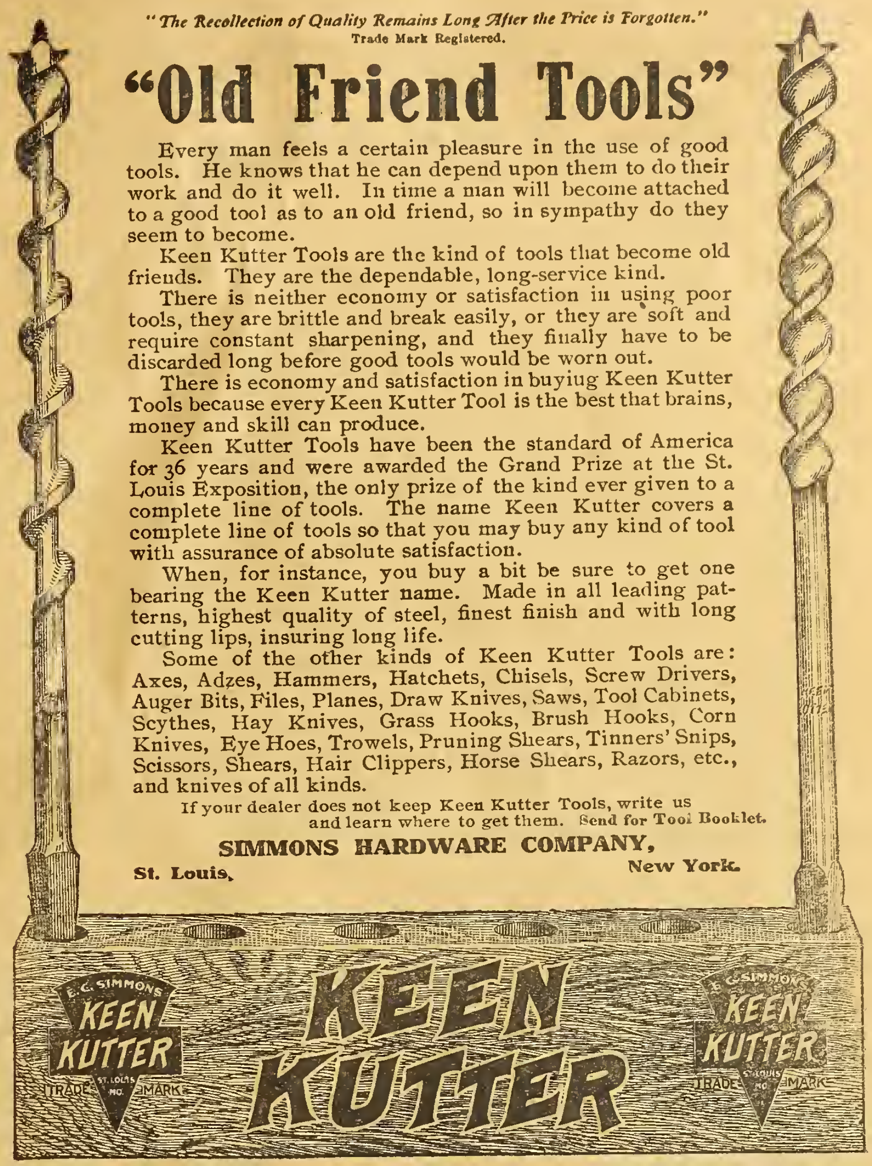
Scraps by the Literary Farmer—I am not so old that I require to be chloroformed, or otherwise to be disposed of for the benefit of that much-talked section, the general public, but my active days of farming are over. My boys allow I know something about the points of an animal, but consider me useless when it comes to filling a silo or milking a cow even. So I take life easy and retain their respect by keeping in touch with the latest improvement in scientific farming and agricultural experimentations. Some of these thnigs that interest me may interest your readers, and from time to time I shall send you a few notes.

Bacon.—Our bacon is poor and will not be any better so long as the packing trust do as they please. The Canadians are dissatisfied with the quality of theirs, and have been comparing it with the Danish. The latter is, they say, of superior quality, and the bulk of it comes from cross-breed animals, fed largely on barley. Corn was not much used.

* * *

Weeds.—Spraying weeds with blue stone, one pound to the 5 gallons of water has only proved effectual in killing mustard. All the others are not affected.

"In the spring the husband fools
around with rake and spade and hoe,
And plants and sows a lot of seeds
that never, never grow."



"The Recollection of Quality Remains Long After the Price is Forgotten."
Trade Mark Registered.

"Old Friend Tools"

Every man feels a certain pleasure in the use of good tools. He knows that he can depend upon them to do their work and do it well. In time a man will become attached to a good tool as to an old friend, so in sympathy do they seem to become.

Keen Kutter Tools are the kind of tools that become old friends. They are the dependable, long-service kind.

There is neither economy or satisfaction in using poor tools, they are brittle and break easily, or they are soft and require constant sharpening, and they finally have to be discarded long before good tools would be worn out.

There is economy and satisfaction in buyiug Keen Kutter Tools because every Keen Kutter Tool is the best that brains, money and skill can produce.

Keen Kutter Tools have been the standard of America for 36 years and were awarded the Grand Prize at the St. Louis Exposition, the only prize of the kind ever given to a complete line of tools. The name Keen Kutter covers a complete line of tools so that you may buy any kind of tool with assurance of absolute satisfaction.

When, for instance, you buy a bit be sure to get one bearing the Keen Kutter name. Made in all leading patterns, highest quality of steel, finest finish and with long cutting lips, insuring long life.

Some of the other kinds of Keen Kutter Tools are: Axes, Adzes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Tool Cabinets, Scythes, Hay Knives, Grass Hooks, Brush Hooks, Corn Knives, Eye Hoes, Trowels, Pruning Shears, Tinners' Snips, Scissors, Shears, Hair Clippers, Horse Shears, Razors, etc., and knives of all kinds.

If your dealer does not keep Keen Kutter Tools, write us and learn where to get them. Send for Tool Booklet.

STOP MY ADVERTISEMENT.

"Discontinue my add. It has been the means of selling all of my plants; also a good many of my neighbors"—A. E. Harrington, Los Angeles.

"You may discontinue my add in the Cultivator, as I will have no more eggs to sell for some time to come."—F. L. Hogue, Carpenteria.

The Cultivator gives results—and that is the test of circulation. We have but one favor to ask—try the paper once and you will remain a permanent advertiser with it.

IT'S PENNY WISE

Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 2124 Willow St., Los Angeles.

Sole Agency for Pacific Coast for the

SURE-GO Gasoline Engine

Manufactured by the Wogaman Mfg. Co. Greenville, O.

The Sure-Go is of the latest and most improved design, has fewer working parts than any other Engine on the market, therefore lasts longer. So simple is its construction that any child can operate it. It can be used in any work as it rests upon skids, can be easily moved from place to place, thus of great value to the ranchman or farmer. This Engine is four cycle, four horse power capacity, and can be delivered at a price that will astonish you, it is so cheap.

Anyone interested in Gasoline Engines will find something to their advantage in labor saving and money saving, by communicating by letter or in person.

CITRUS MARKETS

The past week has been another one of very satisfactory prices for citrus fruits, with the exception of two days of extremely cold weather during which sales were slow and the market consequently slightly depressed. With the warming up the market took a brisk rise, prices being firm at a slight advance on all grades.

NEW YORK, Feb. 13.—Twentyfive cars were sold at auction today. The market is very strong and is about 15c higher. The weather is favorable.

Climate and Crops

U. S. Department of Agriculture, Climate and Crop Bulletin of the Weather Bureau, California Section, for the week ending Monday, Feb. 12.

General Summary.—The weather was partly cloudy and warm in all parts of the State nearly all the week. Light rain fell in all sections at intervals from Thursday to Sunday, and heavy rains occurred in portions of Southern California Thursday and Saturday. The southern reservoirs are well filled and all streams are running, insuring abundance of water for irrigation during the season.

Conditions were exceptionally favorable for growing crops and farming operations. Grain is in good condition and making satisfactory growth, with indications of at least an average yield. Plowing and seeding are completed in some sections and progressing rapidly in others. Sugar beet planting continues and work has commenced in the hop fields. A carload of asparagus was shipped east from Alameda county on the 9th, some twenty days in advance of the first shipment last year. Grass is making fair growth and green feed is quite plentiful in nearly all sections. Stock are generally in good condition. Potato planting is in progress.

Orchards and vineyards continue in good condition and cultivation is progressing. Early deciduous fruits are advancing rapidly and several varieties are in bloom in the central and southern sections. Present prospects are good for an excellent yield of fruits and grapes. Oranges and lemons in the Santa Clara valley are ripening rapidly and orange harvest is in progress in the Cloverdale district. Orange shipments from Southern California are light.

Eureka Summary.—Weather continues favorable for all vegetation. Plowing and seeding are progressing. early sown grain is in excellent condition and making rapid growth. Grass is doing well. Stock are thin but much improved.

Los Angeles Summary.—Generous. well distributed rain during the week benefitted vegetation, and grain and grass made good progress. Seeding continues, but will be finished this week in some places. Olive crushers are busy making oil of fine quality.

Last week the Riverside packing houses kept reasonably busy and 137 cars of oranges were shipped. This brings the total for the season up to 1130 cars, and shows 325 cars less this season than last.

The Victoria Avenue Citrus Association of Riverside had the honor of topping the market, receiving $3.05 for Thompson's seedless. This is one of the highest prices of the year.

The Arlington Heights Fruit Company of Riverside report that their lemon crop this season will break all previous records.

The directors of the State Commission in Lunacy have agreed upon a site at Folsom for the erection of an asylum for insane criminals.

Among the citrus nurseries, Pollard Bros., of Alhambra, are in the first rank and they advertise a full line in the Cultivator.

Thos. S. Armstrong of Anaheim is advertising several different strains of fine poultry for sale in this paper.

Morris Bros., Banning, Cal., are advertising White Leghorns and Barred Rock eggs for sale in this paper.

If interested in turkeys read advertisement of Mr. N. Frank Morse, in this issue.

Attention is called to the poultry advertisement of A. W. Huskin's in this issue.

Buff Plymouth Rocks are for sale by F. W. Tutin of Riverside, see his card.

Blue Andalusians are advertised by C. E. Chittick of Los Angeles this week.

Harry McIntire's celebrated buff Cochins are advertised in this issue.

The Redlands Board of Trustees has ordered an election to be held on Monday, February 12th for the purpose of issuing bonds to build a septic sewer system, estimated to cost $80,000, and to build a new city hall, costing $20,000.

Glendale voted for incorporation and carried the day by 75 to 41.

A POULTRY COLONY.

A new departure in poultry matters is the establishing of a poultry colony which is now under way at Inglewood. Large tracts have been subdivided into several of from one to several acres and these are being taken up by poultry people. The L. A. Realty and Trust Co., are subdividing large tracts and selling in parcels to suit. One of these tracts has been taken up by the Anna L. Pinkerton Co., which will make a model plant on about nine acres. The place will be devoted entirely to White Wyandottes. will have large runs all most conveniently arranged as to feeding, cleaning and general care.

Inglewood aims to be a second Petaluma in the matter of poultry. No surer way to wealth for any community exists than through the poultry yard.

ALBER'S BLACK MINORCAS.

"The best strain of the best breed" is what Mr. George Albers strives to do. Of course breeders of other varieties may dispute with Mr. Albers as to which is the best breed. But sure it is that his Black Minorcas are beauties in looks and beauties at the performance. Big, fine looking eggs and lots of them.

It is indeed a pleasure to look over his yards near Los Angeles, and see his prize winners. Wherever exhibited Alber's Minorcas have won ribbons and with it all, Mr. Albers is a most genial and honorable man with whom to deal.

If any of our readers are interested in butter and cheese making machinery or supplies, or especially in the Sharples Tubular Separators, they will receive faull information by addressing The Joshua Hendy Machine Works, 38 Freemont street. San Francisco.

The Superior Light & Heat Company are advertising their Superior Acetylene Generator on another page of this paper and it is claimed to furnish the most perfect light and heat at a very moderate cost. Write them for full information, mentioning the Cultivator.

After an expenditure of about $500,000, the Southern Pacific officials announced yesterday the final completion of a new piece of track thirty-nine miles long in the Colorado desert, which will enable their trains to run without interference from the waters of the Colorado River, which have filled the Salton Sink and ruined about forty miles of their main line.

More tile is going down all over the Orange county celery lands. The drainage is having a wonderful influence on the soil, further than simply getting rid of the water. The celery does not freeze as quickly. In fact, it is practically impossible to freeze the crop with the water all out of the ground.

Owing to the S. P. Co.'s refusal to provide better accommodations between that place and Los Angeles, the members of the Board of Trade at San Fernando have purchased a 14 passenger automobile.

C. C. Desmond of Los Angeles has been appointed by Governor Pardee as a trustee of the State Reform School at Whittier.

The Sinaloa Land Co., of Los Angeles has purchased five thousand acres in the State of Sinaloa, Mexico.

Sonoma county is now free from debt, after struggling under the burden for more than thirty-five years.

Campbell System
—OF—
Soil Culture

is revolutionizing agriculture in the semi-arid regions of the west. With an annual rainfall of 14 inches, crops of all kinds are as certain and as large under the Campbell System as in the Eastern States. It is a system of scientific "dry farming" evolved through 26 years experimenting in the arid regions.

The late J. Sterling Morton, Secretary of Agriculture, wrote: "Yonr great work in soil culture is thoroughly appreciated by every thinking citizen of Nebraska. Your intelligent efforts to benefit the agriculture and horticulture of this state are of greater value to your race and to those who come after you than all the efforts of all the members of Congress who have ever represented this commonwealth at Washington."

Campbell's Soil Culture Manual for 1905, 96 pages, is a complete exposition of the system. Explains how rain waters may be stored in the soil, moisture movements, relations of air to plant growth and the control of these conditions and functions by cultivation. Practically invaluable to all dry region farmers.

Stockton Reversible Gang Plow

EFFECTIVE DURABLE LIGHT OF DRAFT

This is our regular Plow and Land Shifter and Rear Lever. Land Shifter simple and durable. It is in easy reach of operator and there is no danger of wheel running over foot.

Houser & Haines Mfg. Co.
Stockton, Cal.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pumphead using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

THE FURROW SYSTEM OF IRRIGATION.

During past years there has been much discussion regarding the merits of the different systems of irrigation. The furrow, the basin, and the check or flooding system, all had their adherents. There are, at times, and in certain places at all times, good reasons for using each of these, but the one now universally adopted is the deep furrow system. Did all resort to the checks or flooding, so common at one time, many parts of the State would not have a sufficient water supply to reach all orchards.

A HELPFUL BOOK FOR FARMERS

To one not in constant touch with such matters it is truly astonishing news to learn at what a rapid rate rural telephone lines are being built all over this country. A network of such lines is fast spreading all over the land, furnishing a means of quick communication to the farmer as well as to the dwellers in the towns and cities.

But many communities have not yet built such lines, and the farmers there are consequently shut off from the benefits and privileges their more fortunate neighbors enjoy. It is only a question of time, however, until every farm home will have its telephone. The farmer who hasn't connection now with a rural line will soon be taking the matter up with his neighbors and figuring how they can build a line to their farms.

For the benefit of all such we recommend that they read the book, "How the Telephone Helps the Farmer," published by the Stromberg-Carlson Telephone Mfg. Co., Rochester, N. Y. Besides enumertaing all the practical advantages the telephone offers the farmer and his family, it tells how to go about it to interest your neighbors with you to build a rural telephone line; how to organize the company,— giving blank forms for constitution, by-laws, etc.; how to select and buy the proper equipment, with a chapter on the probable cost per mile to construct the line. In fact, the book is full from cover to cover with helpful, practical information the farmer cannot get anywhere else and makes the preliminary work of getting a telephone line perfectly clear and easy. The same company publishes several other books you will want. If you are interested they will send them all to you free, and will assist you in every way they can to organize your company, and build your line properly, so that it will not only be a success, but a benefit to every one on the line. Write today for the book. "How the Telephone Helps the Farmer," and tell them what you are doing and what you expect to do,—they will give you expert advice which will make the work easy for you. It will only cost you a stamp to write for it, and may save you several hundred dollars when you come to build your line.

BODEN'S WHITE LEGHORNS

John P. Boden of Watsonville, is out with one of the prettiest catalogs that we have seen issued for any poultry yard. Has only twelve pages but is full of half-tones of his own White Leghorns, Toulouse Geese and pigeons. The cover is of a heavy grey tint board.

Regarding his stock, Mr. Boden says in his introduction: "I have not striven to raise birds for exhibition, but to build up a strain of first-class egg producers."

Lovers of White Leghorns will enjoy a look at Mr. Boden's catalog.

SAVE THE WATER

Just at this moment when nature is so profuse in its gifts of water, there is probably but little thought or worry as to the amount which shall be on hand in a few months' time.

At the same time it is a most opportune time to consider how more water can be saved for the dry season which will surely prevail a few month hence. So it is proper to call attention, as we have done before, to the great economy secured by the use of the surface irrigation pipe. This pipe is put up in lengths of ten feet of a single galvanized pipe of various sizes. A request for a catalog at the new office of the Tallerday Manufacturing Company, 210 Los Angeles street, or better a talk with Mr. Tallerday himself, will give information which will be of value.

Leo W. Marden, the White Leghorn man of Hynes, says the eggs from his White Leghorns last year averaged 95 per cent. fertile. He ascribes this to the care in mating and keeping separate his breeding pens. Only the choice hens that are bred to lay are in those pens. His effort is for the 200 egg hen and this he is closely approaching.

S. C. White Leghorns, stock and eggs, are advertised by the Monte Vista Poultry Farm, Corning, Calif., this week.

A Few Remarks About the Care of Little Chicks

BY A. A. WHITE

37 White Minorca hens laid over 3,000 eggs during the months of December, January, March, April and May. Eggs sold for fancy prices—37 hens earned $275.00 in five months—fed daily on Coulson's Mash Egg Food. A. A. WHITE.

The problem of how to raise to maturity strong, healthy chickens has been and will be a very vital question to all poultrymen, who wish to make a success. I believe the excessive mortality amongst chicks is one of the greatest reasons why many poultry ranches are not paying double the dividends or profits that they should. Look at the amount of time and feed wasted on poorly hatched and wrongly fed chicks (which, as a natural consequence, die,) that would be more profitably spent on healthy stock.

Yet the solution of this problem is not so hard as it appears. The main thing is to get your chicks hatched right and from stock with lots of vitality. This being granted, now comes the FEED QUESTION, the VITAL QUESTION.

It has been proved beyond a doubt that chicks fed on dry food at least for three or four weeks, have stronger constitutions and are far better developed than soft-food-fed chicks. Why is this? Because the natural food of many fowls is seeds, bugs, etc., for which nature has provided.

WHITE MINORCA ROOSTER
Raised on Coulson's Chick Feed. The Feed is the Making of the Chick.

Now, anyone knows that a hen always raises her brood with better success and also far more healthy than brooder chicks; simply because she forages around and finds them a grain here and another there, so the result is they work and exercise at the same time, resulting in healthy bodies, and good growth.

I have proved to my own satisfaction that Dry Feed is IT every time. My experience dates back to when I used crumbly soft food for little chicks and although I could raise a fair percentage, yet I had better success with dry chick food; particularly the ready mixed feed, which I got from my store-keeper, called COULSON'S SPECIAL DRY CHICK FOOD. The first sack I bought seemed high priced but say, the success I had warranted it, for I found it went further than the other feed, and the chicks grew so fast.

A small batch of chicks, about 200, were fed on Coulson's Special Dry Chick Feed for the first month entirely. I scattered it on chopped straw, etc., and made them eat it up clean, so that I couldn't see any left in the straw at night. After they were a month old I fed them with COULSON'S GROWING CHICK FOOD, which was a more bulky food, and therefore, forced them on growing. They were a fine bunch of Chicks, strong and chirpy, and REMEMBER THIS, no bowel trouble or picking of feet They were too busy hunting for their food(Coulson's Special Dry Chick Food) in the straw, to have time to stand around looking for feet to pick at, and their crops only taking a seed at a time, were not gorged, but kept grinding away steadily. At eight weeks old I had 107 chicks left out of 200 out of the incubator. How's that for a percentage? Of this number I sold four dozen broilers at eight weeks old for $3.50 per dozen: average weight being One Pound, fourteen ounces and some went over Two Pounds. These were just White Leghorns, not heavy breed chicks.

That convinced me that dry feeding was the solution of how to raise chicks successfully and COULSON'S SPECIAL DRY CHICK FOOD is the feed to do it with economy. My chicks at eight weeks of age had cost me about 9 cents each, and were fed entirely on COULSON'S SPECIAL.

RAISED ON COULSON'S CHICK FEED.

ADVANTAGES OF COULSON'S READY-MADE CHICK FEED.

A prepared Chick Feed composed of sound selected grains broken to the proper size and blown free from dust is the most economical feed for young chicks. One hundred Pounds will feed as many chicks as Two Hundred Pounds of ground grain.

Why It is Preferable.

The proper feeding of Poultry is without a doubt the most essential factor in the raising of any kind of poultry for profit. Considerable advancement in the feeding of poultry has been made in the past few years especially in the feeding of little chicks.

Chicks should be fed a feed that makes healthy, well developed bodies. COULSON'S SPECIAL DRY CHICK FEED contains the ingredients that are the best adapted to give nourishment to the growing chicks. Sweet, tender seeds, cracked grains, blown free from dust, cut oat meal, tiny pieces of cooked and dried meat, fine particles of fresh cut bone, charcoal, burnt bone, and other good things.

It is a clean, sweet feed that is easily digested, and chicks show an increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first six weeks. You can feed your chicks entirely on COULSON'S SPECIAL DRY CHICK FEED the first six weeks at a cost of about 5 cents apiece.

Ask your feed dealer about Coulson's Special, and be sure that he don't sell you something else. Remember it is COULSON'S that you heard so much about, and make YOUR WILL POWER strong enough to insist on getting Coulson's.

If your dealer don't keep it, write us, and we will tell you where and how to get it.

The Functions and Importance of Roots

By Eizo Kondo, a First Year Student in Agriculture at the California Polytechnic School, San Luis Obispo.

Hidden at the bottom, like the engine of a steamer, the root is a most important organ of the plant life. The functions are three-fold as a rule; it anchors the plant to the soil, it absorbs the nutriments for the plant from the soil, and it serves in many cases as a store house of food for the future use of the plant.

The firmness of plants in the ground depends upon the nature of their roots, though the depth and character of the soil influence, to a certain degree, the extent of the roots and the tenacity of their hold. The roots of the maize in a rich, tenacious soil. for instance, extend but two or three feet, while those in a light, sandy earth have been traced to a length of fifteen feet. In general, those plants which are exposed to much stress of weather have large and strong roots. Thus tall trees and herbs are fastened to the ground by an elaborate root system, while those whose circumstances do not require such have but a few slender roots.

All the underground roots may be divided into two classes. The dicotyledonous plants or exogens, have at first a single descending axis, the tap-root, from which, in most cases, the lateral or secondary roots branch out in all directions. The order of their branching is more irregular in older plants than in younger ones, owing to the mechanical hinderances of the soil. This mode of growth beginning with one main root is called the axial mode. Monocotyledonous plants or endogens have no single axis, but produce what are called the crown roots or fibrous roots whose mode of growth is monaxial or radial, that is, they radiate in all directions from the base of the stem. This distinction has important bearings in agriculture, for the roots belonging to the first kind draw their plant food from the lower strata of the soil, while those of the second class spread near the surface and consequently are more dependent upon the external conditions.

Before describing the most important function of roots, absorption, it is necessary to consider their structure. The root is composed of four parts; the epidermis (bark or skin) the outer covering for protection against harms and re-absorption of the sap by the soil; the cortex or the soft layer beneath the vascular cylinder, the hard woody axis running through the center, and the medulary rays which are fine silvery lines radiating from the center. Besides, the tip of root hair is termed the spongiole from its texture. This important section is well protected by the root-cap consisting of cells that have been loosened from the main structure and thus serve merely as an elastic cushion to defend the true termination of the root.

The growth of nearly all roots is mostly in length but very little in thickness. Wigand, in an experiment, divided the young root of a sprouted pea into four equal parts, by ink marks and after three days he discovered that the two upper divisions had scarcely lengthened, while the third was double and the fourth was eight times its previous length. For the same reason a root cut off in transplanting never afterwards extends in length. The quantity of roots actually belonging to any plant is usually far greater than can be estimated by roughly lifting them from the soil. A conservative estimate of four well-developed corn plants gave an aggregate length of over a mile of roots not counting the root hairs. The entire root system of a squash vine was found by actual measurement to be over fifteen miles in length not considering the root hairs, and of this length, the major part must have been produced at the rate of 1000 feet per day,(Osterhout.) The quantity of roots in per cent of the entire plant in the dry states was found to be as follows:

Winter wheat examined last of April, 40 per cent; winter wheat, examined last of May, 22 per cent; winter rye, examined last of April, 34 per cent; peas examined four weeks after sowing, 44 per cent; peas examined at the time of blossom, 24 per cent.

The Pride of the State.—Our Big Tree, Sequoia gigantea.

Now the imbibing the nourishment from the soil is of the utmost importance to the plant life. The root, however, is ingeniously fitted for this work. The root hairs which are exceedingly minute and delicate and cover the young portions of the root system, absorb by osmosis the plant food very dilutely dissolved in water. The raw sap thus imbibed from the soil is carried upward by the root pressure and capillarity, through the vascular cylinders of the various portions of the plant, to the leaves. the starch factory; then a portion of the manufactured food is carried down back to the roots for their growth and often for storing it for future use. It would almost appear that the root is endowed with instinct in its search for food. From the very beginning of their development, strenuously against obstacles groping around with numerous rootlets penetrating through chasms, undermining rocks, they go down day and night until they strike their goal, the plant food. Their spread also, as a rule, corresponds to that of the branches, so that they may drink every drip of the rain and dew falling from the plant.

Now for the majority of the biennials and for some of the perennials, the roots serve as storehouses of the plant food. This is one of the many wonders performed by nature. Plants like the dahlia and hawkweed perish above ground in winter being unable to withstand the frost and cold, but survive underground through the supply of nourishment stored in their roots, so that they may start afresh in Spring with all the advantages over their less prepared competitors in the never-ceasing struggle for existence and reproduction. Again the hardy winter herbs such as the plantain, dandelion, and common dock which keep a rosette of green leaves above ground throughout the winter are supplied with more or less fleshy roots full of nutriment.

The soil is not the only medium for roots to live in, though it is the most proper and common one. Many plants are living in water fed and supported by the aquatic or water roots which may be easily distinguished from the subterranean roots through their white thread-like, tender and succulent texture. The parasites have a sort of root known as haustoria, a term meaning suckers or absorbers, for they draw sap, either raw or digested, from their hosts for their own use. The aerial roots are those which have no concern with the soil, nor are dependent upon other plants except perhaps for anchorage, as the orchid, but acquire plant food and moisture from the atmosphere. Often, however, they serve as merely the climbing roots, as in the case of the poison ivy or the trumpet vine. The adventitious roots occur on the stems as those which appear at the lower nodes of corn. They serve to firm the plant in the soil as well as to perform the other functions of ordinary roots. Most plants are fortunately able to produce the adventitious roots when they are covered or kept in contact with the ground, thus making their propagation by cuttings and layers possible.

Hastily, by way of conclusion, the root may be defined as a body of tissues provided with vascular bundles which originate from an older, previously existing part of the plant: its growth is not limited, and it never directly gives rise to a leaf.

NITROGEN WANTED.

A writer in the Florists' Exchange of New York, says: "The question of an economical source of nitrogen for commercial purposes, shows possibilities of becoming a problematical one for growers in the near future. In 1904 nitrate of soda could be purchased at from $40 to $45 per ton; at present its market valuation is held at about $52 per ton at wholesale. Organic nitrogen, which formerly was obtainable in the form of by-products of slaughter houses, is no longer available at reasonable prices; the meat products of those establishments now having strong demand as poultry food. Unquestionably, there is great need of a new source of commercial nitrogen from some quick-acting material at a reasonable cost.

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

GRAFTING FIGS AND OLIVES

Editor Cultivator.—Is the process of grafting figs and olive trees different in any way from that used in grafting apples? Constant Reader.

Olives may be grafted successfully by following the methods used in grafting apples, but figs are more successfully grafted by taking out a V-shaped piece of bark at the upper end of the stump and inserting therein a scion from last year's growth. The scion should be so cut that it will set down in the incision, the inner barks of both stumps and scion joining along the edges. The curves of the bark side of the scion will bring the inner barks together if trimmed properly. The bark on the stump is much thicker than that of the scion, so the scion will be countersunk. Wax well with a mixture of one part tallow, two of beeswax and four of resin. When well mixed, grease the hands, turn the liquid wax into warm water and pull it like you would candy. This will toughen the wax and make it more durable. Wax the grafts after wrapping them with twine or cloth. After the grafts have been in two or three days, go over them and wax again to close up any cracks that may open. The wax should be put on with a brush.

Wrap the fig trees with old sacks so that the trunks and branches will be protected clear up to the grafts. The olive trees will send out a mass of suckers that will cover the trunk. These should be topped to prevent them outgrowing the tops, but leave enough to shade the trunks.

* * *

BEETS

Editor Cultivator.—I would like you to give me a little assistance in the way to grow sugar beets, the amount that can be grown per acre, the market prices. Also the nearest sugar factory to Rosamond, and would it pay to grow sugar beets here and ship them. There are hundreds of acres of good beet land here that are not cultivated, but would be if we had a factory in this locality. H. J. L., Rosamond.

It will cost you on an average, $20 per acre to grow sugar beets that will go ten tons per acre, calculating on the cost of harvesting and delivering to the factory at $1 per ton. No one can tell how many tons per acre can be raised in a new district, until a trial is made. There are too many things to take into consideration, such as drouth, time of thinning, insect pests, untimely winds and a dozen other things too numerous to mention. Chino is the nearest point to a factory from your station. You can get the most information on cost of transportation from the factory people themselves as they can do better with the railroads than you can and if you are willing to make an experiment, the factory people will help you if there is any indication that they can make yours a sugar beet district. They will know more about that from the beginning than anybody else as they have made a close study of the subject and are only too glad to open up any new sugar beet district. Write to Mr. Louis Hache, of Oxnard, and state the case to him.

* * *

NEMATODES

Editor Cultivator.—I send hereby a collection of roots and beg of you if you would inform me through your paper, the name of the disease, the cause and is there any name for it? For the last six years I have been trying to replant places of dead peach trees, but every new tree turns out the same as you see in the box of roots I send you. I took all necessary precautions in planting, such as throwing out the old soil and filling in again with fresh soil, but it does no good. I am satisfied that it starts right in the nursery. I know that the nursery where I got my trees has root knot. Hoping to read an answer in your paper, I am yours, A Subscriber.

The samples of root which you send are badly infested with Nematodes, a small worm that is one of a large class. These worms attack beets, parsnips, roses, peach trees and a score of other plants. Your own soil is affected, but how it became so, we cannot tell. The only remedy for you, is to devote your land to some other culture until these worms are starved out. Grow grain or alfalfa for a couple of years and you will get rid of them. You will no doubt find that your older trees are affected the same way, tho' they may continue to fare better than younger trees will. You may remove soil till doomsday and you will still have those worms as long as they have food that will support them.

We cannot give you the specific name (variety) of these nematodes, but if you send a sample to Prof. C. W. Woodworth of the Agricultural Department of the State University, he will give you the information.

* * *

GRAPE QUESTIONS

Editor Cultivator.—I notice in the February 2nd Cultivator, mention of some new varieties of grapes, Blue Portuguese, Cipro Nero, August Giant Verdal, Olivette de Cadanet and Muscatello Fino. Is there any description? G. E. B.

Blue Portuguese is a very early grape, similar to Mission and an arbor grape. Cipro is a very late grape, reddish purple, very tender and crisp, ripens about the time of Purple Cornichon, but is a poor keeper. It is the best flavored grape to ripen in its season. August Giant is a very large purple grape of the Concord class. Verdal is a large white grape, bunches similar to the best London Layer Muscats. Ripe in September. Muscatello Fino is a black grape that is identical in flavor with the Muscat except that it is slightly sweeter. It and Cipro Nero do their best when pruned half long.

* * *

VALUE OF GREEN CROPS

Editor Cultivator.—I see that you are an expert in answering questions. Let me prepare one for solution. If it is too hard for you, please refer it to our professors at Berkeley. Your paper recommends to plant peas, clover, etc., in our orchards to strengthen the soil; to be planted in September or October and plowed under in February or March, occupying the ground for six months out of twelve. The question is this. Will the land receive a greater benefit from these crops than they would if the same had been kept in a fine absorbent condition during these six months by frequent cultivation? C. T.

The last part of the preceding answer is the best we can say on this subject. It has been proven that clean culture exhausts the humus in the soil and that means that the life giving element in the soil is gone. The humus of soils contains the greater part of the available plant food. There is plant food left, but when the humus is gone there is no humic acid to work on it and make it available and the plants begin to suffer. Stable manure supplies humus at the surface, but growing plants supply it at the surface and as deep as the roots go which is far below the plow furrow.

We sell country lands. CHATFIELD & VINZENT, 228 Montgomery St., San Francisco, Cal.

Practical Farm Science

BY PROF. A. J. COOK

ITALIAN BEES.

Bee-keeper, Orange, asks if I will not give my opinion of the merits of Italian bees in the Cultivator. As this is a very practical question, I gladly answer. The honey bee is wholly oriental. So are all our honey bees, black and yellow races alike, were imported. The black or German bees were first introduced and well distributed before the yellow races were even thought of. The fact that today all our ablest bee keepers keep only Italians, speaks volumes in favor of the yellow race. A race of inferior or even equal merit would hardly supercede a well established breed. Surely not with men of highest intelligence.

The black bees are uniformly black or gray-black throughout. The Italians are a little larger, brownish in color, and marked with three yellow bands or rings on the abdomen just back of the thorax; all of which show plainly when the bee is full of honey. When the honey stomach is empty, the third ring may hardly show. The ring close to the thorax is very narrow, the next wider, while the third is the one that is often obscure. If all the bees show the three rings, then we may be sure of their purity.

I will now give briefly the points of superiority of the Italian race. First—they are more active, and thus work more. They also have larger tongues and thus often gather from flowers with such long tubes that the nectar is beyond the reach of black bees. Common red clover is worthless as a honey plant for black bees, though often of much worth to Italians. For both of the above reasons, Italian bees give much more honey than do black ones. Italians are more active also in defending their hives from robbers and the bee moth. Thus they are safer. I am not sure that they are, as often claimed, less subject to attack from fowl brood and other bacterial diseases. The Italian queens are surely more prolific, and thus they breed up more quickly and are likely to be stronger at all seasons. Lastly, the Italian bees are much more amiable than are the blacks, and so much less likely to sting. I have often worked unprotected for days together with Italians and though I used no smoke, I received no stings at all. I could not say this of black bees.

In only two respects do black bees excel. They are sometimes more ready to enter the supers where the fine comb honey is to be secured, and the honey is a little whiter than the same from Italians. In California, extracted honey will always be produced largely, and so these points will not count, though were I to work wholly for comb honey I should still wish the yellow banded or Italian bees.

The very bright yellow bees are very handsome, and so some breeders are tempted to breed for color alone. Thus the very bright yellow bees are not generally as excellent as are the darker or more leather colored ones. I prefer a leather colored, large, queen to one very bright yellow in color. I therefore urge all to secure Italian bees. I am sure that in California, especially they are much to be preferred to the German race. Nor do I believe with the same chance, as has been claimed, the black bees will run the Italians out. On the other hand, I feel sure that the reverse would be true. I know that vigor is more with the Italians and in a race, vigor is what counts.

* * *

RUSSET APPLES.

The Golden and Roxbury Russet apples are excellent in flavor and of equal merit to eat in hand or for sauce or pies. They are remarkable keepers, and what is best of all they are always crisp and fine. I find the same holds here in Germany. We find no American apples that please us as well as do russets. We can buy the Bellefleuer, the Northern Spy and the Greening, but none stand up and hold the flavor as do the russets. Next to the russets come the Rhode Island Greenings.

I think I have heard from Mr. Maskew that the russets do well in California. Surely they are apples to send abroad. I believe there will develop here a splendid market for apples, and in this case we must study for varieties that will hold up and keep their quality. I doubt if we can find any varieties that will hold their goodness as well as the russets. If the golden russet will do well, it is worthy a first place as a market variety, especially for long distance shipments.

* * *

I have just been reading a very interesting work that gives an account of the phenominal growth of Germany in business and wealth. The Krupp Co. is described at length. This company has made a wondrous and most exceptional record. They do great things for their employees. They have many more offices of help than they can use, and have never had discontented men, or help, and have never been even threatened with a strike. They provide for the families of their employees in case of accident and look after the general welfare of this help. They feel that much of their success comes from satisfied, contented assistants.

He, six weeks after the honeymoon—I suppose you think you were a fool when you stood up and married me?

She—Well, I was the next thing to a fool. —Yonkers Statesman.

ACTIVITY IN VINE PLANTING.

Dread of fatal vine diseases does not seem to materially affect planters in the upper country, for there is a more active planting of vines this season that ever before known. The favorite varieties are table grapes and in San Joaquin and Sacramento counties, these form the great bulk of the new plant, and of these the Tokay takes the lead by all odds. This is unquestionably due to the fact that these grapes have commanded extraordinary prices during the past few years, culminating last season, when prices were best in many years, and the growers who had grapes for sale grew rich. Thompson's seedless is growing in popularity in many localities. It is a heavy and certain bearer and has made a very profitable grape, both for raisins and the table in the past.

VIGOROUS FIGHT AGAINST PEAR BLIGHT.

There are now six pear blight exerts from Washington, who have been sent out by the Department of Agriculture, at work in the pear orchards of Northern California. These are Prof. Waite, in charge of the work, Prof. Scott, his first assistant, and Profs. W. W. Gilbert, D. B. Swingle, Perley Spaulding and E. L. Shear. Besides these, Prof. Ralph Smith and a number of young men from the University are at work. The policy pursued is to take several sections in which the blight is thoroughly established and concentrate all efforts on these, completely eradicating the blight within a given area. This is for the purpose of demonstrating that with proper work, the blight can be controlled. These sections will then become exemplars of the method and success of the treatment recommended by the Washington experts, and will be used as object lessons for the pear growers and County Horticultural Commissioners, showing that the disease can be controlled and how it can be done. In each section, too, there will be a number of students who will learn how to fight the disease, and hereafter sufficient skilled help will be attainable to control the disease all over the State and give assurance of the future success of the Bartlett pear industry.

IMPERTINENT INTRUDERS.

When a man, for any cause, becomes prominent in the public eye, he is regarded as a curiosity, and very many people, who are neither interested in the man or his work, and who do not understand either, will intrude themselves upon him, oftentimes very much to his annoyance and detriment. This is the experience which Luther Burbank has suffered from a mere impertinent curiosity to see the man who is being talked about for his remarkable work. As Mr. Burbank is one of the most modest of men, this stupid curiosity would be annoying in any case, but as it most seriously interferes with his labors, it is doubly annoying. One who appreciates the work Mr. Burbank is doing will understand that he has to follow a certain line, sometimes for years to produce the result aimed at, and this requires the closest attention, he cannot afford to stop long enough to be admired by a senseless throng, because he happens to be popular, as the very work for which he is admired would stop if he stopped for the benefit of his admirers. This, however, is the experience of all public men, they are always the target for the curiosity of the unthinking masses, who would gaze upon them as they would upon a curious animal, simply because they are talked about. We notice that, owing to the Burbank grounds being overrun with curious visitors, friends of the great originator have taken up the matter of his protection and a circular has been issued forbidding visitors the premises. It is to be hoped that this hint will be effective, and that those who have no business with Mr. Burbank, except to satisfy a mere morbid curiosity will leave him alone.

THE SILK INDUSTRY IN CALIFORNIA.

After years of waiting for capital to set the silk industry going in our State, it really seems that the auspicious moment has arrived. A capitalist, attracted by the special advantages to be gained by the use of a newly invented silk reel, has provided means to test the feasibility of producing the finished article in San Diego. He has bought thousands of trees and expects to get all necessary apparatus at once.

There is already a local market for all good cocoons, and many persons are preparing to take up the business of silk raising. "Cheap labor" is not a factor. According to consulate reports the Chinese only get about 30 per cent of the available product because of the lack of scientific work with both trees and worms.

The newly patented silk reeler and twister will save one-half to two-thirds of the former amount of labor and do better work. This invention will open a new industry for the State. Good cocoons may be raised in every county in the State. In some sections only one crop can be produced, but in many two and three may be developed if plenty of food trees are present.

Italy annually imports 70 to 80 tons of silk eggs at a cost of $60,000 per ton. One small county in Lombardy sends out $5,000,000 worth of silk every year.

One acre of trees will produce from $75 to $100 worth of cocoons each crop. The United States sends out each year $50,000,000 for reeled silk to keep our more than 900 silk factories at work. The introduction of silk growing and manufacturing may mean millions of dollars annually added to the income of our State.

Taylor's Seeds

Try Seeds First, Then Send Money

In order to introduce our seeds as rapidly as possible we will, upon request, send one each of our specially arranged collections of choice vegetable and flower seeds. The quantities are proportioned and selected to give a continuous supply of flowers and vegetables of high quality throughout the season to those who do not care to wade through long catalog lists. So certain are we that they will give satisfaction, that we will send our collection of flowers, 14 varieties, and our vegetable list, 14 sorts, for $1.00, and wait for our pay until you have tested the seeds and proven to your own satisfaction that they will germinate and produce the results we claim. If they are not first-class you do not send us a cent, if they "make good" June 1, send the dollar.

You know we could not do business on such liberal terms if our seeds were not as represented. They are guaranteed true to name and the seed grown. Remember, we require no money in advance. Order today, using coupon below, and you will say it was one of the most profitable dollars you ever spent.

F. Gilman Taylor Seed Co.
Box 27, Glendale, Cal.

Please send me prepaid one each of your vegetable flower collection. If they grow satisfactorily, I will pay you $1.00 on June 1st, 1906. If not satisfactory, it is understood that I am to be at no expense whatever.

With the Citrus Growers

BY J. W. MILLS

CUTTING BACK OLD ORANGE TREES.

Editor Cultivator: I have some old seedling orange trees that have been allowed to grow too high and are showing some dead wood. The oranges are good but small. What month is best to cut back? Can the fruit be brought up to a good grade by liberal fertilization? What fertilizer shall I use? What quantity and when?—Subscriber, Santa Barbara.

Any time after the first of March will do to cut back your trees.

The fact that your oranges are small indicate that they should have more nitrogen. We would suggest that you give them a liberal application of stable manure and grow legumes among the trees. The general impression is that nothing will grow under the large seedlings that shade the ground. You will find that a fairly good growth may be had if you give them frequent irrigations. Keep the ground moist and they will grow.

* * *

MAKING MEDITERRANEAN SWEETS BEAR.

Editor Cultivator: I have a number of large Mediterannean Sweets which do not fare well. They set a large crop last year but dropped nearly all of it in June. The trees made a good growth last year but they are a little yellow. Would pure blood be a good fertilizer for them?

A neighbor of mine told me to slit the bark on the trunk as the treees are bark bound. He told me of a number of cases where the trees were treated that way and they afterward bore well. Never having heard of this method of treating trees before, I would like to have your opinion on it before I try it. Please answer through your valuable paper.—A. G. D., Redlands.

It is a common complaint with the growers who have Sweets that they fail to get a crop after a full bloom. The splitting of the bark will often relieve a bark bound tree, but that does not remove the primary cause. Splitting the bark will not hurt the tree. We are not in a position to say what fertilizer to use to insure a setting of fruit. There are too many contingencies that have a bearing on the question of fertilizers. Under the same applications for fertilizers year after year, there will be a different character of fruit during the different seasons. The only rule which we feel sure will not be very far out of the right way, when the trees are not looking just right, is to give them a liberal application of stable manure and keep the condition of the trees as even as possible as regards moisture and cultivation. Green crops grown between the trees will restore the natural condition of the soil better and cheaper than anything but stable manure will give relief in this respect, a little quicker. It seems that there is pretty strong proof that continual clean cultivation has brought about a large number of our citrus troubles. One thing is sure and that is, such farming is contrary to nature and when that becomes a custom in any line of action trouble is sure to follow.

THE HARDY ORANGE.

Just outside my window is a large, vigorous shrub, perfectly hardy in the latitude of Washington and also as far north as Philadelphia, and even in some regions where the winters are still more severe. This shrub was introduced from Japan a good many years ago, and is commonly known as the trifoliate orange, or hardy orange.

Although the shrub belongs to the orange family, it is not a true orange. It has a small fruit about the size of a walnut, yellow in color, but unfit to eat. The leaves of the shrub fall off at the approach of frost. like the leaves of other deciduous plants.

A number of years ago when several great freezes destroyed the orange groves of Florida, our men, who were at that time engaged in the investigation of the citrus fruits in the state. conceived the idea that a hardy orange might be secured by using the small Japanese or trifoliate form as a basis for breeding. To conceive this idea was to act. Soon work was going on, having for its object the production of a race of hardy oranges. The work was done partlv in the greenhouses at Washington and partly in the orange-groves of the South.

The hardy Japanese type was used as one of the parents, while the well-known type of tender sweet oranges of Florida constituted the other parent. Many thousands of crosses were made and many thousands of seedlings, the results of these crosses, were secured. These were grown from time to time in our green houses, and then sent South to be tested.

As soon as the seedlings began to grow it was known that hybrids had een secured: but this was not sufficient. First the hardiness of these seedlings had to be determined, and secondly their nature as fruit bearers had to be ascertained.

The little seedling oranges, having within them the blood of their hardy northern parent and the blood of the edible sweet orange of the South, were planted in a number of sections to test their hardiness. It was found after a few years that they could stand considerable frost; that is, they could be grown as far north as Savannah or Charleston, without fear of serious injury.

Up to this time no fruit had been developed, and it could not be determined what their real value was in this respect. In 1904, however, we began to obtain the first fruit from these new types of oranges, with the result that we are encouraged to believe that we have an absolutely new creation in the way of a citrus fruit, something that, while different from the orange, will be exceedingly valuable to the whole Southern country.

So far, the fruits borne are more like lemons than oranges. Yet they are not lemons in truth: They have some of the characteristics of the grapefruit, or pomelo. They are about the size of an ordinary orange, and not only make most delicious preserves and marmalades, but are very valuable for summer drinks and "ades" of various kinds.

These new hardy oranges mav never take the place of the ordinary sweet oranges as we have them today, but they will certainly be of immense value in placing in the hands of the people of the South a fruit which they can easily grow in their back yards and which will enable them to provide their tables with delicacies heretofore not easily obtainable.

The full story of these oranges is not yet told, for there are many other seedlings to be heard from in the matter of bearing fruit. The hope is that among these will be found hardy sweet oranges. and that thus it will be practicable to establish orange groves again in all parts of Florida.—Prof. B. T. Galloway in Youth's Companion.

ORANGE TREES
Oldest Established Citrus Nursery in California,
at Alhambra, Los Angeles County
Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.
E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Angeles, Cal.

Orange Seed Bed Stock
I have some 50,000 fine seed bed stock for sale. These plants are good color and very thrifty. Absolutely clean and healthy in every way. I will make them caliper 3-16 of an inch and up to ⅜ or ½ inch. Owing to the large size of the plants the packing will necessarily bring the price above the ordinary price of common sized plants, but they will be sold cheap, and if you intend setting it will pay you to see this stock.
J. M. Baker - - - Glendora, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

NATIVE EVERLASTING BOUQUETS.

Cat's tail of the swamps makes a good decoration for large halls and keeps indefinitely if gathered before it is quite ripe. The stems should be cut low enough to retain several leaves. After the leaves are dry they may be painted green.

Several wild plants related to the edelweiss of the steppes and the immortelles make beautiful and lasting decorations. Anaphalis, or pearly everlasting. is common on the fog-bathed ocean slopes, while an equally beautiful gnaphalium is found on the valley slopes. The beauty of these plants lies in the satin-like sheen of the scaly bracts which surround the head of the true flowers. When the plant dries, the bracts bend back, allowing the withered flowers to fall. In one species the greenish disk where the flowers grow contrasts beautifully with the silvery white of the involucral bracts. It is usually best to put a little water in the vase with these plants.

For winter bouquets the stems should be carefully cut when the ripe heads are yet closed. These can be distinguished from the closed heads of flowers that are yet fresh by the protruding, withered corollas. Immediately after collecting, roll the stems up closely in paper. They will keep, thus treated, a whole day. Put them in a vase with water, as you would fresh flowers. In a few days the heads will open. Frail and evanescent as these snow white spheres look, they will keep until the dust has hidden their beauty.

ORRIS ROOT CULTURE.

As is well known, the orris root of commerce is grown almost exclusively in Italy, the chief centers of production being at Florence and Verona. The plants yielding this article are the common species of Iris, especially I. florentina, I. germancia, and I. pallida, cultivated widely as the common fleur-de-lis of many gardens. In many letters. advertisements are cited in which the cultivation of orris root is boomed as a quick road to wealth, and the conditions of the market are described in glowing but entirely misleading terms. One advertisement states that orris root is worth 40 cents per pound, is protected by a duty of 25 per cent., and meets with an annual demand equaling $2,000,000. On this basis, an offer of roots for cultivation is made at an excessive price. As a matter of fact the average price of dried orris root of commercial grade varied between 3.8 and 9.6 cents per pound during the period from 1897 to 1904, inclusive. There is no duty on orris root. The total importation averages about $20,000 annually. During the last two years the orris business in Italy has been in a somewhat dubious state, due to the low price realized and the lack of profit to the grower. Owing to such deceiving statements as above cited, there is a great likelihood that many people will be misled to their financial loss. Some advertisers claim to have the indorsement of the Department of Agriculture, whereas the Department has in no way suggested the culture except on a small scale in a purely experimental way. It is of the opinion that the outlook for building up the orris industry in the United States is at present not good. Although a limited demand may arise for roots for purposes of cultivation, one should not fail to remember that an orris industry can be built up only on the basis of the utilization of the root in a commercial way.

EVERLASTING FLOWER

Sprengel's Cudweed (Gnaphalium Sprengeli) with several other species, form a most interesting group of plants known as "everlasting." Their sole claim to beauty lies in their glistening, snowy whiteness and in a country without winter flowers, would be much appreciated. Some of the more common species grow in all parts of California, so that our people are never at a loss for material in case they wish winter bouquets. Take note of our illustration and look for them this winter.

MULBERRIES

The mulberry is a neglected tree. It possesses decided value in ornamental planting, and some of the varieties are useful for hedges, shelter-belts, and small timber. The fruit has merit for the dessert, and it is easily grown and is produced more or less continuously throughout a period of two to four months of every year. It is especially suited to farm life, for it does not take kindly to the city, and in California is not especially desired by reason of its being deciduous, but in the rural districts it is always amid harmonious surroundings.

SOME ROSES.

One of the most conscientous seed and nurserymen is Theodore Payne of Los Angeles. He has an exceptionably well selected stock of seeds, bulbs, ornamentals and deciduous trees. Just now he is putting in a full line of deciduous fruit trees for local trade. Of ornamentals he has a fine collection but the most complete selection of roses are to be had in his nursery. Later he expects to get out a complete catalogue of his stock which will be invaluable to planters.

In the Vegetable Garden

BY ERNEST BRAUNTON

THE GARDEN MOLE

The common garden mole is not altogether destructive as they feed entirely on insects many of which are, to the farmer, most serious pests. Aside from the destruction of insect pests, they stir the soil in corn, and alfalfa fields in a beneficial way.

They seldom eat grains of newly planted corn. Much of the damage in this direction, so often attributed to moles, is really done by species of mice that follow in their runways. It is also true that moles sometimes kill young plants and trees by cutting off their roots just below the surface of the ground, but this is not by way of getting food, but solely because the roots are in the way of the animal's progress.

RADISHES

The radish is desirable every month in the year. They are easily grown, mature in a short time, and can be used as a catch crop at any place in the garden. They are often planted between rows of beets, cabbage, cauliflower, etc., and are marketed and sold before these crops demand the intervening space. By sowing at intervals of two to four weeks apart, they may be had fresh for the table or market, throughout the year. The best variety for one gardener may not be the best for another, as the choice of color, form, size, etc., depends upon the consumer; the red, however, appears to be the more popular color.

VEGETABLE SOILS

Light sandy soil and sandy loam are particularly well adapted to the production of vegetables. These soils will produce an abundance of early vegetables in whatever locality they may be found. These soils also give up their fertilizer readily, hence respond quickly to any change in the necessary elements. We may, by judicious selection, find nearly an ideal soil for this purpose in every county in the State. There are, however, other conditions, as those of temperature and moisture, that need to be taken into consideration.

CHINESE VEGETABLES

Various garden vegetables have been introduced into this country by the Chinese, some of which are worthy of a place in American gardens.

The best known and perhaps the most valuable of these new vegetables is the Pe-Tsai, or so-called Chinese cabbage. This plant bears a loose lettuce-like head of crisp leaves, which may be used in all the fashions in which cabbage is served. This plant requires a cool and moist soil in which to make its best growth. It is essentially an autumn vegetable.

The Chinese mustard is an excellent plant for greens and produces an enormous amount of herbage. Its culture demands the same attention as that advised for Pe-Tsai.

California Peppergrass appears to be a finely cut-leaved form of a mustard long known in old gardening books. It is one of the best of all plants for early spring greens. Although the species is cultivated in China and Japan, it does not appear to have been independently introduced from those countries in recent years. It is not known how or when the plant first came into this country.

Other mustard-like plants recently introduced from China are the Pak-Choi, used as greens and for the white thick leaf-stalks; and the Tuberous-Rooted Mustard, grown for its small turnip-like root. These plants possess less merit for American gardens than the foregoing species.

BUSH BEANS

There are numerous varieties of bush beans, and the variety to be selected depends upon the use you desire to make of them. They vary as to earliness, productiveness, color, size and quality. The bean can be grown on almost any soil, but revels best in those comparatively light and well-drained. Never plant too early, as they are liable to be injured by the late frosts in early spring.

CELERY

This is a vegetable that should be found in every garden. At present nearly all our supply comes from the Orange County fields in the south and the San Joaquin fields in the north. Celery is not difficult to grow; the main thing is to select a comparatively level spot in the garden and to enrich it with well-rotted manure. The plants are generally started from seed in trays or a small bed made for the purpose, and then transplanted into rows in the garden, about six inches apart. In order to make the plants stocky the tops are clipped back when young. It is always desirable to have the soil as moist as possible.

A SIMPLE SEED TESTER.

A circular from the United States Department of Agriculture describes the simple method of testing seeds. The circular states:

As long as seedsmen disclaim any form of guarantee with seeds they sell it is necessary for the purchaser to be able to estimate the quality of what is offered. The percentage of seed that will grow can easily be determined by means of a simple tester. Mix the seed thoroughly and count out 100 or 200 seeds just as they come, making no selection. Put them between a fold of cotton flannel or some similar cloth, taking care not to let the seeds touch one another. Lay the cloth on a plate, moisten it well, but do not saturate it, cover with another plate and keep at a temperature of about 70 degrees F. On the second and third days take out and count the sprouted seeds. Good seed should germinate 90 per cent. or more in three days.

KEEPING POTATOES.

The best way to keep seed potatoes is to put them in a dark and dry place with even temperature. Cold storage is the ideal location, and the best results will follow that method, and when that is not practicable it is best to come as near to it as possible. Absolute darkness is better than light, other conditions being equal.

CHINESE CABBAGE.

The Pe-Tsai, or Chinese cabbage, is no longer a novelty in American gardens, although it does not appear to be well known and its merits are not understood. Its cultivation and peculiarities were described in France so long ago as 1840 by Pepin, who says that, while the plant had been known in botanic gardens for twenty years, it was brought to notice as a culinary vegetable only three years before he wrote. It appears to have attracted little attention in Europe, however, until very recent years. It began to attract attention in the United States probably about fifteen years ago.

Fortunate Indeed.

An old darky was taken ill, says the New York Times, and called in a physician of his own race. After a time, as there were no signs of improvement, he asked for a white doctor.

Soon after arriving, Dr.——felt the old man's pulse, and then examined his tongue.

"Did your other doctor take your temperature?" he asked.

"I don't know, boss," replied the sick negro. "I hain't missed anything but my watch as yet."

STRAWBERRY PLANTS
(TROPICO BEAUTY)
The very best Brandywine stock at low prices for sale by the grower,
Griswold, Box 25, Tropico, Cal.

Cuthbert Raspberry Plants
$1 per 100, $6 per 1000
Gray's Gardena Dewberry
$1.25 per 100, $8 per 1000
A. E. Nelson, El Monte, Cal.

IMPROVED GARDENA DEWBERRY
And all other kinds of Berry Plants.
Nursery Stock for sale.
A. R. Rideout, Magnolia Nursery, Whittier, Cal.

BRANDYWINE PLANTS
Brandywine Strawberry Plants for sale, Kellogg's strain. No better nor thriftier plants grown. Clean of all disease; at bottom prices.
G. W MULLENDORE, COVINA, CAL.

Seedless Blackberry
The main crop has no seeds. Very early, extra large and very prolific.
Geo. W. Peck, 670 Horton Ave., San Diego, Cal.

$1563 Berries from One Acre
Picked by a grower near Los Angeles in one year; ($800 net profit). He used Armour & Co.'s fertilizers. R. M. Kellogg Co say Armour's Bone, Blood and Potash gives good results. This fertilizer is ***highest in plant food value of any made in California,*** according to tests of Berkeley University. If you "want to be shown," telephone or drop me a card.

DELICIOUS RADISHES FREE with BARGAIN LIST
A Big Package of Splendid Radish Seed, Enough to Grow Bushels of Luscious Radishes, Free
Everybody loves a tender, juicy radish.
Send to-day and get free, our Great Bargain Seed Book and enough Radish Seed to keep you in luscious radishes all summer long.
Or, if you prefer, we will send you sufficient grass seed to grow 5 tons of rich hay grass on your farm this summer and our Bargain Catalog, free for the asking.
Our Bargain Catalog is a wonderful book, brim full of rare bargains at bargain prices of all kinds of Onion, Sweet Corn, Cucumber, Radishes, Lettuce, Tomatoes, etc., etc. and also a wonderful array of pedigree farm seeds as Oats, Wheat, Corn, Barley, Potatoes, Timothy, Grasses, Clovers, Alfalfa, etc., etc.
Simply send us this notice, sign your name and address and the free package of Radish or Grass Seed as you select, together with this new interesting Bargain Catalog with all of its bargain offers, all of its bargain surprises in flowers, vegetables and farm seeds, all the valuable information showing our wonderfully low prices, all will be sent you by return mail postpaid.
If you enclose 4c. we add a package of Cosmos—the most beautiful fashionable annual flower.
JOHN A. SALZER SEED CO., Lock Box 50, La Crosse, Wis.

Burbank's Crimson Winter Rhubarb **Our Specialty**
$1.50 per dozen, $7.50 per 100, $50 per 1000
Citrus Trees for wholesale and retail trade, also full line of **Deciduous** and **Ornamental Stock.**
Wagner's Nursery **Phones: Home, 1291; Sunset, 1297** Pasadena, Cal.

BURBANK'S PHENOMENAL
—RED RASPBERRY—
The berry which earned $1,400 per acre last year. It is a cross between the "Improved California Dewberry" and the "Cuthbert Raspberry." The berries grow in clusters of from five to ten, or more, and individual berries, under favorable conditions, have measured three inches one way by three and one-half to four the other. It's a surprise and delight to people when first seen, being so large and luscious. Mr. Burbank has recently said: **"It is the best berry in the world."** The demand for plants last year far exceeded the supply, and the demand now is greatly on the increase. This speaks for itself as to the quality and merits of the berry. It being easily grown and firm, it is a profitable berry for the fruit grower or small rancher to produce for shipping to home or distant markets. Also, it's no mistake if one has a half dozen plants in the garden or back yard of a town or city residence, for, by their productiveness, they prove a delight for the table and yield great returns for the amount invested. We can supply the plants in dozen or thousand lots. **Warranted hardy anywhere.** Write for fuller particulars to
California Carnation Company
Loomis, California

CALIFORNIA CULTIVATOR

ESTABLISHED 1889
PUBLISHED EVERY FRIDAY
AT
Room 416, Hearst Building, San Francisco, Cal

Value of Reforestation.—Our government is probably expending more money both for labor and literature, toward educating the people of California to a proper appreciation of the value of reforestation than is the case with any other project in which our people are interested. Notwithstanding the continuous efforts of the Forest Service in calling attention to the value of this work, both for the conservation of our water supply as well as for the production of much-needed timber, our farmers seem inexcusably negligent in not taking up the matter as individuals.

The Forest Service stands ready to aid everyone owning "watershed" lands that are in need of tree planting, where such lands contribute, even in a slight degree, to the local water supply. Aside from its economic value, the reforestation of our bare hills and mountains would change many sections from bleak, inhospitable landscapes into charming woodlands, a transformation "devoutly to be wished" and of inestimable value to both individuals and the State.

Not only should we have our hills dotted with majestic pines and cedars, but these may easily be accompanied by fitting retinues of smaller trees and shrubs. It has long been a matter of common knowledge that we possess native trees, easily procured, of unquestioned value in this work, but of late the study of our "chaparral" has led to fruitful practical conclusions. It shows remarkable ability to encroach upon and spread over open country even in semi-arid sections. It makes a satisfactory water-shed covering and almost constantly replaces a forest destroyed by fire. The seeds of the shrubs composing this "chaparral" are produced in abundance, are easily collected, as easily started and transplanted and those so planted soon surpass in growth and vigor the naturally sown plants.

To one who have given the matter serious consideration it seems almost incredible that owners of hill and mountain lands make no effort to enhance the value of their holdings by this simple and economic method of reforestation. The government plantings during the past few years have demonstrated beyond the point of experimentation, the value of certain trees and shrubs for the different sections of the State. Now that intelligent and effective work may easily be done by the individual without risk of failure, our foothill farmers should avail themselves of this priceless opportunity to add beauty and value to lands at present practically worthless. If the efforts of the Forest Service in this campaign of education results eventually in the transformation of our denuded hills and mountains into water-conserving lands, it will be of incalculable value to our whole people.

Government Control of Life Insurance—In a letter to the Editor of the Cultivator, John Tuohy, a leading agriculturist of the San Joaquin valley, makes the following well-timed observations in reference to the "thievery" practiced on the public by Life Insurance Companies of the present day. He says:

"In reference to the thievery which has been practiced in Life Insurance, all of which the public will never know, much is said, and a little is being done, on lines of reform. Is the effort on right lines? I think not, but I think not for the reason the public at large has not given the subject the consideration it deserves.

There is no gainsaying the fact that old age, too often brings with it want and this want should be provided against. A general system of Life Insurance will be the proper provision, but this can be attained only by a Government Insurance System. The State Grange Patrons of Husbandry of California advocates this, and by a governmental system only can life insurance be made safe, economical and effective. Let those who want to, call this socialism. It is true and right, nevertheless."

* * *

Prof. Wickson's Report.—The Cultivator referred last week to the report of the Commission selected to locate the College farm in California. Prof. E. J. Wickson of the University of California heads this commission and has devoted a great deal of labor to the examination of sites to secure a suitable one. In the report he presents to the Governor, he states with much cogency the conditions essential in his judgment to a proper selection of a farm site. His requirements are first, widest representation of agricultural conditions; second, absence of conditions which make any locality a special one with reference to productions; third, proximity to some considerable center of population. "According to these standards," says the Professor, "this location should be made from the most available offerings near Modesto, Stockton, Woodland or Dixon."

The Sacramento Union, in an editorial, warmly commends the work of the Commission as being "close and intelligent," and adds: "The Union which has from the beginning, followed this matter with great interest, is glad to commend a judgment which has sifted down a multitude of offerings to the four which he regards as ideal, or at least, extremely good. We will not pretend to expert knowledge, but can only express the hope that choice will fall upon a tract either in Yolo or Solano counties in the region dominated by Woodland of by Dixon. There would seem to be special propriety in giving the choice to Yolo county, due to the fact that it has been active from the beginning in the work of securing a State farm. It is to be remembered that a representative of Yolo county was the first to move in this enterprise and that from the beginning Yolo county influence has been an active and aggressive force in promotion of the farm project."

* * *

Raisin Growers Disband—The Raisin Growers' Association of the Fresno district has disbanded. The cause is stated to be the unsatisfactory price raisins were fixed at by the directorate. Failing to sell at the figures named, the entire product left in the warehouse went at 3 cents a pound. Of course this meant demoralization. It is to be regretted that the Association has disbanded. It could have derived better results from co-operation than by individual selling. Now each grower must shift for himself and that means competition of the most disastrous sort. We trust a new association may arise which will have less or no friction in its ranks, and that the discordant elements which have been the cause of the breaking up of the present association will be kept out of the reorganized body. More can be accomplished by co-operation, with honest management, than by individual effort which always promotes strife and disastrous competition.

* * *

Politeness.—If young girls and boys could be taught the value of politeness, how much more attractive they would be. The nice little habit of lifting the cap, which the boy can so easily become used to, makes him always the object of pleasant remarks by ladies and gentlemen whom he passes. The girl who smiles as she passes you on the street is always remembered for her "pretty ways." Parents can do as much toward making future amiable men and women as teachers in our schools. Why do they not pay more attention to the cultivation of politeness in their children? It certainly pays to do so.

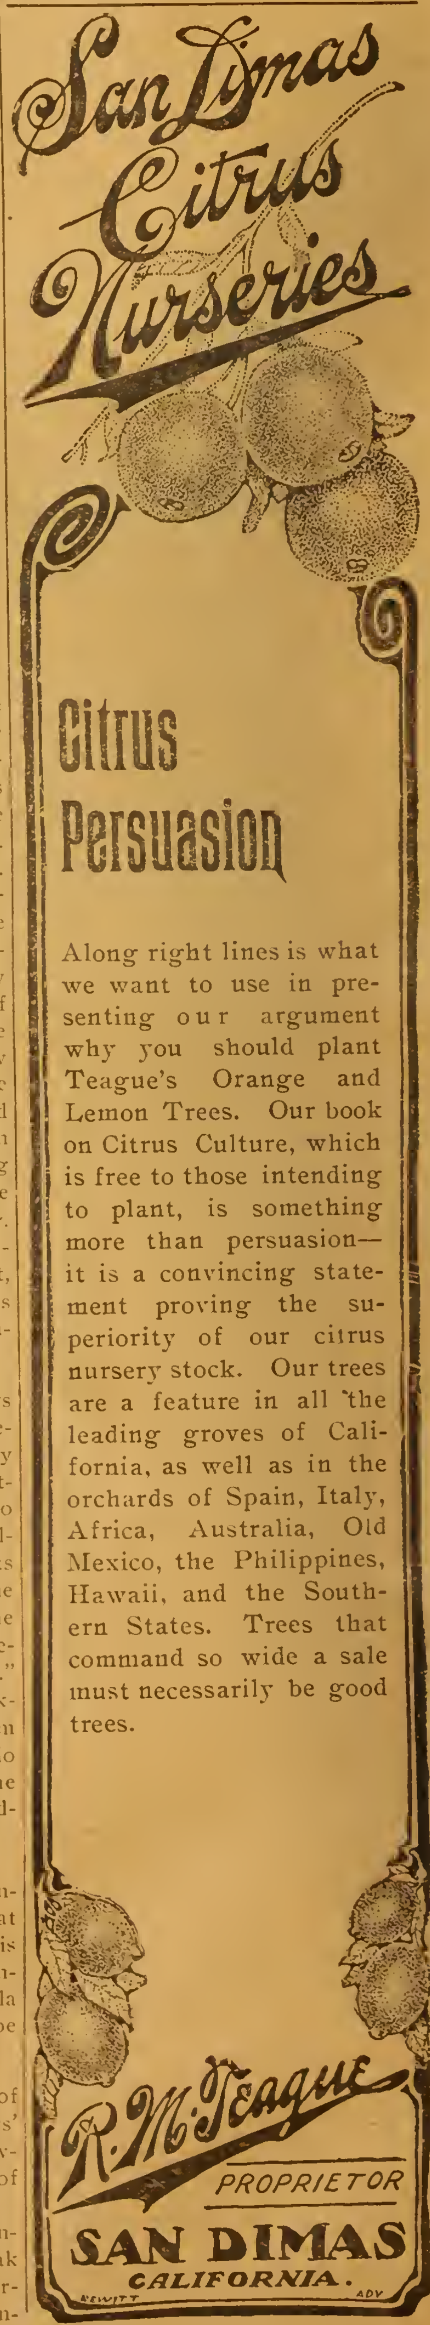
* * *

Farmers' Institute—A Farmers' Institute will be held by Mr. Neff at Corona the 26th and 27th of this month. Prof. Ralph Smith of the University, C. C. Teague of Santa Paula and J. W. Mills of Pomona will be instructors.

* * *

The Fullerton News, in speaking of the work being done at the Farmers' Institutes this season has the following complimentary word for one of its leading instructors:

"Mr. Ernest Braunton of Los Angeles, was in the city to speak before the Farmers' Institute on "Ornamental Tree Planting." Mr. Braunton is associate editor of the California Cultivator, and a special contributor to the Los Angeles Times and Country Life (New York). Although still a young man his nineteen years study of street and garden ornamentation has proven him an expert, and his writings on matters of this sort are recognized as authority and are of especial interest."



Citrus Persuasion

Along right lines is what we want to use in presenting our argument why you should plant Teague's Orange and Lemon Trees. Our book on Citrus Culture, which is free to those intending to plant, is something more than persuasion—it is a convincing statement proving the superiority of our citrus nursery stock. Our trees are a feature in all the leading groves of California, as well as in the orchards of Spain, Italy, Africa, Australia, Old Mexico, the Philippines, Hawaii, and the Southern States. Trees that command so wide a sale must necessarily be good trees.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

One of the biggest walnut orchards in Southern California (150 acres) will be planted in Chino this spring.

It is estimated that about four thousand acres are being planted to vines in the Lodi district this season.

Arbor Day this year called out very general observance. It ought to have been observed by every town in the State.

The United States during the past few years has consumed on an average 100,000,000 pounds of California prunes.

Cut worms are destroying trees set this spring in the territory north of Bakersfield. An antidote should be used at once.

W. R. Mansfield of Brawley has 40 acres in year-old Malaga grapes and this spring is setting out 35 acres of the same variety.

The warm weather is forcing fruit trees around Marysville ahead too rapidly at present, and some are already in bloom, while others soon will be. It is feared the frost will damage them.

The setting out of Malaga grape rooted vines and cuttings now divides importance with the cantaloupe seeding activity, about five hundred acres being in process of planting to the Malaga at this writing.—Submarine.

The Pomona Progress has this to say about the market. "The citrus market is getting back in shape after congestion of heavy early January shipments. Prices are advancing and free shipments are beginning again. Estimates of the season's output continue to decrease. It now looks as if it will fall 4000 carloads below season of 1904-05.

A Fresno dispatch of the 19th says, "At a mass meeting of the California Raisin Growers' Asociation today it was decided to discontinue all functions, the association to pay back to growers all money in the packing house and organization funds. The association will continue its legal existence to avoid expense of disincorporation and of incorporation in case of future organization of the raisin growers. The practical result is for disbanding, though the corporate existence may be employed in a revival by voluntary signature of contracts by growers to sell on a basis of 3 1-2 cents in the sweat box.

AGRICULTURE.

The cotton crop of Mexico in 1905 is estimated at 90,000 bales.

The Wagner Bros., of Anaheim, are preparing to plant 200 acres of potatoes this spring.

The beet-sugar factories in operation in the United States in 1905-6 amounted to 53, as against 6 ten years ago.

Manager Schroeder of the Chino Beet Factory reports beet contracts for 9500 acres, the largest of any except one year.

Grass is beginning to show enough strength on the ranges to partially support stock. another week or two feeding dry stuff will cease.

The grain farmers in this county, says the Santa Ana Bulletin are as happy as a clam at high tide, and declare that the prospect for a big crop was never better.

Shipments of celery from the Peat lands to date aggregate over 1800 cars. It is expected the total for the season will run close to 2000 cars, or about 200 more than last year.

Between sixty and seventy applications have been filed with the Rangers of Government lands for permission to graze stock on the Tahoe reserve. The applicants embrace residents of Sacramento, Placer, El Dorado and Amador Counties.

The largest hay warehouse in the State was destroyed by fire at Hollister last week. The four thousand ton warehouse of the Lathrop Hay Co. was built last year at a cost of $10,000, and was of corrugated iron. $16,096 of hay was burned belonging to seventeen different owners.

The managers of the new beet sugar factory at Hamilton are making contracts with the farmers to furnish them with beets. They agree to pay $4 per ton for beets that have 13 per cent sugar or under, and 25 cents additional per ton for each per cent of sugar over 13. They also agree to give one-half of the pulp to the farmers.

A Placerville correspondent writes that the probable grazing fee for the season of 1906 will be 6 cents per head for sheep and 25 cents per head for cattle and horses. People owning or leasing land in the reserve will be given credit for the amount of stock the land will support and will be charged only for the feed on Government land.

The Crop Reporter for February, 1906 gives the live stock in California as follows: Horses 399,673; average per head, $76.32; mules, 69,679, average per head, $91.30; milk cows, 390,015, value per head $34.65; stock cattle 1,167,107,17, value per head. $17.50; sheep 2,398,439, value per head, $3.03; hogs, 573,522, value per head, $5.45; a grand total of $83,233,256. And yet they tell us that California isn't a stock-growing state.

LIVE STOCK.

The Alta Advocate says, cattle on the foothill ranges are beginning to look sleek and fat.

W. R. Van Dyke of Ukiah, shipped 300 fat hogs to San Francisco, last week and got the top market prices.

The dairy interest of Solano county is to receive a new impetus by the establishment of a large creamery plant in Suisun.

More blooded stock is going into Kings and Tulare counties this spring than at any period in the history of these counties.

Hanford last week had a poultry show, the first ever held there, and from the accounts in the Hanford papers it appears to have been a very successful one.

On Tuesday there were shipped 15 carloads of livestock from Imperial, consisting of 9 cars of goats, 5 of cattle and 1 of hogs. The goats were shipped by Mr. Conant.—Imperial Standard.

The value of the work of the State Fish Commission was particularly exemplified last year, during which no less than 117,000,000 salmon eggs were taken, of which it is estimated 85 per cent will be hatched and released in the rivers of the state.

Arthur Fuller of Imperial says there are over 100,000 hogs in Imperial valley. From stock buyers it has been learned that the monthly shipment averages about 6000. The average price on the present market is at least $10 a head. To sum it up, $60,000 is distributed monthly among Imperial farmers for hogs alone.

MISCELLANEOUS.

Gilroy is to have new railroad stock yards and car shops.

Santa Monica hopes for free mail delivery after July 1st.

So Sam Jones says California has produced no great men.

Kern county will erect a high school in Bakersfield at a cost of $50,000.

Hollywood, only four years old expects free mail delivery by January, 1907.

Elsinore will soon have a city park of which any little city may well be proud.

Lost Angeles lost to Seattle in her efforts to get the great Christian Endeavor Convention in 1907.

A theater is to be erected in San Diego by Los Angeles capitalist. The building will cost $75,000.

A deer driven from the mountains by the cold ran through the streets of Ukiah one morning last week.

During the year just closed the Southern Pacific brought to the state 80,000 more people than it took out.

A Tehama county farmer is shipping home a carload of Polled Angus cattle as the basis of a herd of fancy cattle.

Maywood, in Tehama county, is to have a new creamery, which in turn will be supplied with up-to-date machinery.

B. A. Ramsay, formerly manager of the Daily Cypress. has commenced the publication of the Evening Montereyan, at Monterey.

San Luis Obispo Breeze, says the Brookshire Oil Company is about to close a contract for the sale of 40,000 barrels of oil per month.

Mine owners in Yuma county are protesting to the county supervisors against the maintenance of low drinking places near the mines.

At Chico the school children have a disease of the eyes which physicians term pink-eke. The eye lids swell, the eye-ball becomes blood-shot and in some cases intense suffering follows.

The State Board of Health has declared war on the oyster and suggests the abalone as a substitute. Oysters are now declared to be full of the germs of typhoid fever and also diphtheria.

The Analy Standard says, the Windsor grange has passed strong resolutions asking the Board of Supervisors to employ enough help to put the highways in order. That is right. Let other granges follow suit.

At San Bernardino an association has been formed for the purpose of offsetting the oppressive operations of the Standard Oil Company and its affiliated concern, the Associated Oil Company.

Prof. Wiley, chief of the Chemistry Bureau of the Department of Agriculture. declares that more than a million infants have been sacrificed in this country by giving them impure foods and the various preparations for allaying pain.

That California is a State of magnificent distances is well illustrated by the fact that the newly appointed postmaster at Cima, a new mining town of San Bernardino county, could find no notary public nearer than 200 miles to swear him in.

An immense amount of oil has been shipped from Monterey the last fifteen months, says the Monterey Cypress. The first shipment was made in November, 1904, and ever since there has been an average of four cargoes a week shipped from that port.

PLOWING UNDER PEAS

A question has been asked, whether peas should be plowed under or only disked. The question arises whether by plowing the bacterial nodules are not exposed to the air too much, thereby losing considerable of the nitrogen. This question may be worthy of consideration.

In my opinion I think that the nitrogen gained by plowing under the tops is nearly equal to what may be lost by exposing a few nodules. Furthermore the improvement in the texture of the soil by plowing under the peas is considerable. The soils of California as a rule are poor in humus, and any organic matter added to it is of considerable benefit in improving its texture as well as adding fertility. H. O. Sorkness.

If you would like some Concord grapes and other fine specialties, see the Pioneer Nursery advertisement in this issue.

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

FEEDING

This is an old subject, yet it never seems to be exhausted, for as long as people are taking up dairying as a pursuit, the elementary work will have to be gone over with each lot of beginners. The knowledge of food values in practical work enables one to buy at an advantage, for when one kind of food is high in price, another of nearly equal nutritive value may be cheap. When food is grown at home, conditions one year will give a heavier crop of corn and a less one of alfalfa, or the reverse, this being the case the foods purchased must necessarily be varied from year to year. There is also the further check of palatability. An animal will eat more of a food that it likes than of one it does not relish, and the milk production depends directly upon the food consumed.

While to many people a cow is a machine, yet she has well developel personality as an individual and also the inherited characteristic of the breed and to reach the limit of milk production the characteristic or temperament of the cow must be catered to with consideration. When I speak of the different breeds I realize that I am on treacherous ground. I cannot see how fair-minded people can quarrel as they do over the breeds of dairy cows, for there are good and bad cows in every breed, though I believe it easier to succeed with a breed in the like conditions under which it was formed, or the proper environment, still with care any breed will succeed in California. It then comes down to the fancy of the owner, if you like one breed better than another then that is the breed for you, but do not believe for an instant that all the good cows are of that breed, or you will simply be a laughing stock in the eyes of intelligent breeders.

When the cows refuse to eat up clean their grain, watch to see if they are hungry enough to eat freely of hay and straw, for then the grain is not palatable. The Jersey cows I have had all liked concentrated foods, oil cake and grains, with a little bran, a moderate amount of silage and only about half as much hay as the other cows. The Holsteins craved silage, pie melons, beets or extra succulent eating grain best when well moistened. The Durhams also like their food very wet and eat more straw and hay than the other two breeds, leaving silage for hay. The Durham tends to eat too much hay and the Holsteins too much silage. To keep the digestion perfect the cows must eat of hay or straw for roughage.

The cows can be tested to see if they have enough of any class of food by first feeding them all the grain they are paying for, then give access to a yard with manger of hay and silage, timing them as to the length of time they spend on consuming each kind of food. It will also show why some of the cows fail to digest their food, by failing to consume enough hay. These cows fail to regurgitate all the food and it is not chewed over as cud and moistened properly before being swallowed. The remedy is simple, to force them to eat more hay, by soaking the hay and slightly salting it and then putting it under the grain in the manger, reducing the grain until the cow eats it all up clean.

These inarticulate ones have no way of telling us their wants except by their actions. Now if the cows are kindly treated and satisfied with the quantity and quality of their food, they move quietly from barn to field and back again. At one time the Durham cows took to rushing in and out as if hunting for something lost, and seeming dissatisfied with their food. The only thing lacking they were accustomed to have was straw, so I had a lot purchased and when a manger was filled it was eaten with relish and the unrest ceased at once.

* * *

Cows require more of a variety in their food than horses, and at times show strange cravings, eating old sacks and bones. When this morbid appetite occurs it is well to buy some fresh bones from the butcher and after having them ground give each cow a tablespoonful in the grain feed for several days.

The bulletins from the University should be in every dairyman's hands, especially the one on feeding by Prof. Jaffa is useful every day on the ranch. The old idea that book farming is no good has passed away. The cry now is that it is too good! The International Live Stock Exposition at Chicago, where fat cattle are awarded premiums, has proven the work of the Experiment Station to be of cash value. The steers fed by the Experiment Stations were selected in the open markets and fed to demonstrate the value of various feeds, and ways of handling cattle, while exact records are kept to be published for the benefit of the farmers. The fat cattle proved to be winners so often that the contention has been raised by other feeders that as they were selected by experts and fed on State money they should be excluded from competition. This is certainly a great victory for the men of book learning.

We do not in this State make nearly as much use of the University as we should. At the State Farmers' Institute at Berkeley last December, I was more than ever impressed with the ability of the men filling positions in the Agricultural College and their interested willingness to help the farmers in whatever way needed. I felt proud of them on the platform beginning with that brilliant man Dr. Hilgard. There was not one who spoke to us that did not pay for the trip to San Francisco. One thing spoken of is the idea that "cowcollege," as the students call it, was meant to be a term of derision. Dr. Hilgard explained it was affection on part of the student to nick-name anything. These professors are studying the same problems we are working on; we hammer it out in the slow school of experience, they bring trained minds that know just where to attack the problems, and accomplish in a few months the result of a life of experience. It was said by a speaker from the platform that one breed of cattle was more nervous than another in the State herd and that it as shown by their rushing from the barn to the field and back again at night in the same pell mell way. I felt sure that they were hungry for something their ration did not furnish, and in consequence these cows could not be doing their best at the milking pail, for evidently the feed they were receiving did not "stick to the ribs" as the ranch boys express it; the boys themselves give this as a reason why they prefer pork and beans to oatmeal for a working diet.

* * *

Where cows are not thrifty the following will often increase the appetite; mix equal parts of fenugreek, anise seed and ginger, adding to each ounce of the mixture one ounce of flax seed meal, divide into six parts and give one part a day in two feeds at first, and increase until the cow receives the full amount in a day rations, but only continue for a short time as owing to the effects of stimulating the appetite they must be supplied with food that is relished, and the cow should be rejected that proves too expensive.

The desirability of a ration often depends on the fact that it can be home grown. and the expensive item of freight be saved. It is a shame that Indian corn and sorghum are so little grown, when they are the natural balance to alfalfa. The silo should be considered more than it is for the dry season in California is the dairyman's opportunity to reap high prices. The expense from silo is no longer necessary and the latent endorsement of the stave silo comes from Oregon. where at the State Dairyman Association, Mr. H. W. Whiting declares the State silo a success and also a necessity for economic production of milk. At this same meeting the vetch was discussed by Dr. James Withycombe as a forage crop; it has a little more protein than alfalfa hay, being about 23 per cent. I wonder if it is grown at all in California? I tried it once years ago in Fresno county but had a very dry year to contend against and afterwards found that the land grew corn so profitably that I did not repeat the trial.

Any crop that can be grown on the orchard and fed to dairy cows with the concentrated foods, will pay in the returns of fertilizers alone, for the manural value is not injured, but made more valuable by passing through the dairy cow.

BREEDING OF DRAFT HORSES

Secretary James Wilson has this to say concerning the breeding of draft horses:

"The heavy draft horse is one of the most profitable classes of horses that the farmer can breed. The draft colt can be bred with less risk and liability to accident than those of the lighter classes. This is partially due to the fact that the draft bred colt is usually a quieter animal than those of the lighter classes, and thus less liable to injure itself through spirited

TUBULAR
Starts Fortune
If you had a gold mine would you waste half the gold? Dairies are **surer than gold mines,** yet farmers without separators only half skim their milk. Tubular butter is worth 25 to 35 cents. Cream is worth one cent fed to stock. **Are you wasting cream?**

exercises or playfulness. Furthermore, small bunches and blemishes which detract so seriously from the value of the harness horse or the saddle horse are not considered to be so objectionable in the draft horse. He can also be made to earn his own keep after he is two years old, and his education can be completed on the farm; thus the farmer who breeds him can secure his real market value. In case of the coach horse or the saddle horse the middleman who educates him usually reaps a much greater profit than the man who produced him. This is not true of the draft horse.

Some of the essential points to be considered in selecting a draft horse are good feet and legs, plenty of weight, a well-developed and good style and action. A draft horse without good feet is worthless on any market; hence good feet are the first essential. The hoofs should be large, round and wide at the heel. They should have width, but not be too deep or shallow. The horn should be of good quality, as indicated by its denseness. The wall must be strong and not inclined to be flat. The legs should be well set under the body and possess plenty of substance, as indicated by the quality and amount of bone and the development of the muscle on the fore-arm and gaskins. Weight is an essential point. A draft horse should weigh from 1800 pounds upward—the more the better, provided it is combined with quality and good feet and legs. The body should be deep, wide and strongly coupled as indicated by shortness of back and the muscling of the loin. Good action is essential, as indicated by the length of stride, quickness of step and straightway movement.

BEDDING FOR COWS.

Wheat straw is quite generally and satisfactorily used as bedding material for cows where dairying is carried on in connection with general farming. Where dairying, however, is the principal industry of a farm the supply of wheat straw is likely to be deficient and the question of securing bedding material becomes then and occasionally at other times an important problem. To gain information as to the value of various substitutes for wheat straw was the object of experimental work conducted recently by C. F. Doane at the Maryland Experiment Station.

Sawdust was found the most satisfactory of the bedding materials tested. Unfortunately, it is not always available, and objections have been raised to sawdust manure. Shavings were found to be almost equally as good as sawdust; but the same objections have been made to shavings manure as to sawdust manure. The tests indicated that about 1100 pounds of shavings would be required yearly per cow. "For strictly sanitary dairy, sawdust or shavings are the ideal bedding materials, though the ordinary dairy farmer could not be advised to buy when he could raise the straw."

The absorption tests were made in the laboratory, and judging from the amount of water capable of being absorbed by each of the materials used, it was established that 2.8 pounds of cut stover, 3.3 pounds of wheat straw, 8.3 pounds of sawdust, or 3 pounds of shavings would be required to absorb the liquid manure produced by one cow in sixteen hours. The yearly cost of bedding at local prices was estimated at $2.25 for cut stover, $3.11 for wheat straw, $0.30 for sawdust and $3.28 for shavings where cows are stabled sixteen hours per day, or $3.65, $4.15, $0.45, and $4.81 respectively, where the cows are stabled the entire time.

MANAGEMENT OF A CALIFORNIA HERD.

Writing in the Jersey Bulletin, J. E: Thorpe, a Stockton dairyman says: "As to our methods of feeding and handling our stock; Since being in the retail milk business, milk and cream are the aim when we cite at the finished product produced by the cow. Some might ask, why is it that you do not use Holsteins, Shorthorns, etc.? To those I will say than any cow, no matter of what breed, will answer, so long as she produces milk that will hold our customers and make a nominal profit over feed and investment. And we have found that by their persistent labors the Jerseys or their grades answer better than any so far tried—and besides, satisfy that idle fancy for the superb Jersey that lingers within me.

To reach the end—product—we must feed. For no animal, man or cow, can work to capacity without feed. We aim to feed all cows at once, as they seem more contented and quiet, and at this period they are milked, as we have no time to milk after feeding, since the delivering of the milk must be done on schedule time.

When the cows are first brought into the barn they are fed chopped alfalfa hay, with wet malt and bran, to the extent of about 40 pounds per fresh cow, according to individual production and capability to handle the food. This food is mixed just moist enough not to drip the water, and allowed to stand about four hours, in which time the alfalfa becomes very green and quite soft. After they finish this course they are fed alfalfa hay until they force their capacity.

We tempt them about three times by throwing out the worked-over hay (which is used by running through the cutter for mixed feed) and putting before them the best of the hay. They are allowed to run to bean straw stacks, and graze upon whatever they might find in our pastures.

In the spring when grass is plentiful, of course they eat but little hay or mixed feed, but at this season they take quite readily to the stuffing process. We try to milk them at even hours, 3 a. m. and 3 p. m. and in rotation.

Alfalfa does not attain maturity until the third or fourth year; therefore, do not sow it expecting to get the best results in less time.

Alfalfa grows best on a deep, sandy loam, underlaid by a loose and permeable subsoil. It will not grow if there is an excess of water in the soil. The land must be well drained.

Cut hay when the first flowers appear. If cut in full bloom the hay will be woody and less nutritious.

Cut for seed when the middle clusters of seed pods are dark brown.

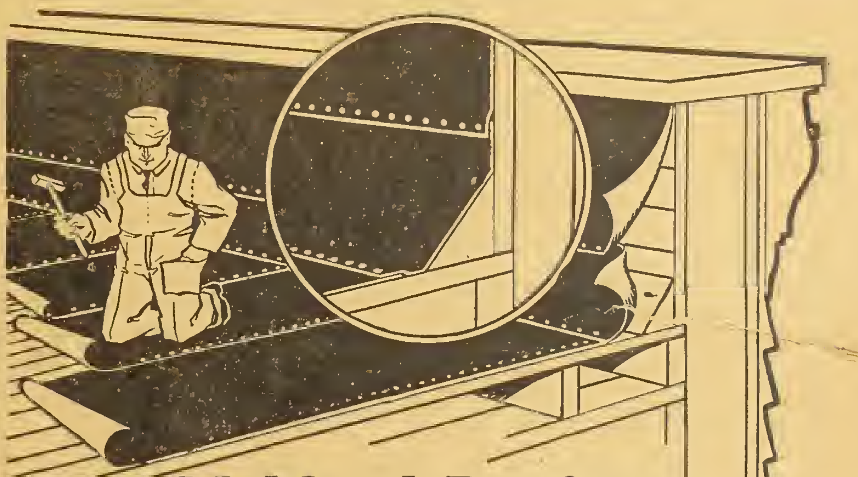
To make alfalfa hay cut in the forenoon and let it wilt; then rake into windrows. It should be cured in windrows and cocks, and stacked or put in barns with as little handling as possible, before the valuable leaves become too dry or brittle.

It is not safe to pasture either cattle or sheep on alfalfa, as they are liable to bloat, when it is fed green. Feed them the hay or practice siloing.

There is no better or cheaper way of growing hogs than to pasture them on alfalfa. One acre will furnish pasturage from for ten to twenty hogs per season.

Horses can be pastured on alfalfa.

Alfalfa is a perennial, a clover-like plant, with oblong-shaped leaves and a taproot which often extends eight or more feet downward. The plant grows to a height of from two to five feet and its blossoms are purple in color, borne in long, loose clusters.



Malthoid Roofing

is a non-conductor of heat and cold. It keeps out cold in winter and the heat in summer. If you want healthy, thrifty stock give them a dry, comfortable house—it pays. Cover your cattle sheds and hog houses, chicken coops and sheep folds, your own house too with MALTHOID, and they will be water-tight, wind-tight, blizzard-tight and heat-tight.

MALTHOID is better than shingles Shingles cost more than MALTHOID. They take more time and more trouble to lay; they warp and curl, crack and decay. They burn easier than anything else about the building, while MALTHOID is a protection against fire. Shingles leak sooner or later; a MALTHOID roof never leaks. Shingles won't keep out the cold and heat.

MALTHOID is better than tin Tin is very expensive; it takes skilled labor to lay it; it has to be repainted about every year. MALTHOID you can lay yourself; paint once in three to five years is enough. Tin sweats and rusts and is no end of trouble. MALTHOID is a satisfaction to everyone who makes his roof of it.

MALTHOID is better than iron Iron rusts; it contracts with the cold and expands with the heat and wears out. In summer it makes the place beneath a regular hot house. MALTHOID keeps out the heat and is absolutely tight all of the year.

MALTHOID is better than other prepared roofing MALTHOID is made by the company that originated the first prepared roofing—P & B Ready Roofing, and they have been making roofing for 22 years. MALTHOID is the result of the best roofing knowledge in the country. Made by the most experienced manufacturers of roofing in the world.

MATING FOR RESULTS

Dr. S. L. Roberts remarked when speaking of mating for eggs, "One can make any stock that one will. It may take time and patience, but when a great object is attained the value of the attainment more than pays."

Like produces like. In every good flock of fowls will be found a few exceptionally good layers. Breeders know this, but they rarely take measures to perpetuate this good quality and make it a prominent characteristic of the whole flock. Amongst these extra good layers will be found in the same flock drones, idlers, that scarcely lay at all; that eat far more than their few eggs will pay for and are kept at a loss to their owners. Every one of these should be found and sold for meat. Like produces like. What folly to breed from them!

But in the same flock are moderate passible layers. What about them? They should never be used as propagators of laying stock. The best is none too good. These moderate layers will have as offspring stock scarcely as good as themselves, usually inferior, seldom superior. Breeders who want to produce a strain of fine layers, a "breed-to-lay-strain," cannot afford to breed from even moderate layers. Like produces like.

Breed from only your best layers, if is eggs that you want. There may be only one or two extra fine layers in your flock. Save every egg from them to build up your flock of great layers. This may seem slow at first, but after the first year you will have their pullets, many of which will be quite equal to the mother, and by keeping the males from these great layers you will in a very few years have "bred-to-lay" fowls, which will pay you in money and pleasure.

Like produces like! One can make any stock what one will by breeding correctly.

* * *

"Will you not write an article on breeding?" writes a lady last week. Breeding is such a big subject, such an intensely interesting subject that it would take more than an article to tell about it, and years of study to follow it all out, but there are some points which we can suggest, even in a short article, which may be helpful especially to the novices, for there are many of them in our midst.

Sometimes I wish I were a novice myself again, for the poultry business is such interesting work!

The subject of breeding for the best results is one of the most interesting and important in the poultry business, just as it is in cattle and horses. This is being recognized more every year in the poultry business.

There is "line-breeding," and "in-breeding," "out-breeding," "cross-breeding," and "no-breeding" at all!

"In-breeding" is quite a bug-a-boo with many. By "in-breeding" is usually meant, or I might sav, is always, keeping the same stock, breeding promiscuously year after year, brother and sister together any how. By this means the flock will deteriorate, the eggs fewer and more infertile. In such a flock the best birds have usually been sold off because they would bring a good price, and anything will do to breed from is the plan there. Just as well keep small potatoes for seed as some do, or "nubbin's" of corn, or the poorest of the berry plants for propagation.

Like begets like. Vigor produces vigor. If you even "in-breed" from brother and sister time and again when they are strong, vigorous birds (I know a man who did this) they will still produce vigorous birds.

"Line-breeding," or breeding in line is a careful and systematic "in-breeding." It is keeping to the same family and is what all the leading breeders advocate and practice.

To illustrate what is meant by "line-breeding" I would take a good pair or trio of thorough-bred fowls, or of my own best layers. The second year I would mate the father to his daughters and choose the best of the sons to mate with the mother, and use these two matings as two different strains for new blood, each year selecting the best from either pen. By the best I do not mean only the handsomest. I mean the most vigorous, active and up to standard requirements of the cockerels, and in the pullets the best layers, the active, vig-

WHY HENS DON'T LAY

When well cared for and well fed, is because they need waking up to start egg production. This comes naturally in the spring—the natural mating season. In winter you have to give something to stimulate them. Without this they are stupid, lazy and dull. Mix **SECURITY POULTRY FOOD** in their rations. It will give them life and activity and shortly your hens will be laying. Don't wonder why they don't lay, but get Security Poultry Food from our dealer in your town and feed it.

WE WILL REFUND YOUR MONEY
if you are not entirely satisfied.

orous egg-type birds. "Close observation and close selection" is the rule in line-breeding. The fear of in-breeding if they follow line breeding leads many people to think it absolutely necessary to have new blood in their flock every year, and here danger lies, for those who are breeding thoroughbreds for a purpose. To illustrate, I knew a famrer's wife who had some fine Plymouth Rocks she was anxious to have prizewinners so she sent away for a first prize winner. She paid a good price for him, got a beauty. She thought she would have prize winners from him in time for the next show, when to her grief she found that all of the progeny of that cockerel were disqualified birds. That cockerel did not"nick" with her hens, although they were of the same breed. This lady was "out-breeding;" that is, she was taking an outsider, of the same breed, but of a different strain or family and made a failure of it. "Out-breeding," as she did is a sort of gamble, one cannot be certain of the results.

"But," said one lady to me, "I am afraid of in-breeding, and the book says change cockerels with your neighbor." I do not know what book she was quoting, but I went to see her fowls. She had really fine birds to commence with, but had ruined her flock by trading cockerels. I will tell you what I did, after trying different methods. When I wanted new blood every year for some pen. I bought a setting of the best eggs of White Plymouth Rocks from the best breeders I knew. From this brood I selected the two best looking pullets and mated them to one of my own males. Some years the pullets proved good layers and up to standard; if otherwise, they were consigned to the table. When the result was good I had new blood which I knew would not deteriorate my fowls in regard to standard looks, but I could not know for two years how it might affect the laying quality of their offspring. Here is the place where "close observation" came in. I trap-nested every hen on my place. The new blood had to be trap-nested and then if they came up to my ideal I had the satisfaction of knowing that this "out-crossing" was a success.

Next week we will continue the subject.

EDITOR'S QUESTION BOX.

Barred Rock Eggs.—(H. J. J.) Editor Cultivator: I have been told that Barred Plymouth Rock eggs do not hatch well in an incubator. Will you kindly state if this is the case, and if so, why? Do you think the moisture pans should be filled sooner than the fourteenth day? Can you tell me where I can get the Danysz Virus for the destruction of gophers? Kindly answer these questions in next week's Cultivator. I have just lately subscribed for the Cultivator and like it very much.—H. J. J., San Bernardino.

Answer. Plymouth Rock eggs hatch well, very well in incubators.

You do not even mention what incubator you are using, so it is impossible to answer your second question. You had better follow closely the directions for operating the incubator. When the Government has the gopher virus we will publish the fact.

* * *

Controling Sex.—(Mrs. W. P. McC.) Editor Cultivator; I take the Cultivator and have been interested in your articles on poultry. I would like to give you my experience. In the spring of 1905. I mated a Buff Cochin cock ten months old, to ten Barred Ply-

EGG FOOD A.C.W. IT FILLS THE BILL

To Build a House

The contractor has to have brick, lumber, hardware, etc; in fact all material to build a perfect house. In order for a hen to "make eggs" she has to have the materials, also, that eggs are made of.

A. C. W. Egg Food Contains All These Elements in Exact Proportions

Analysis of the Egg:

Water	650 grains
Albuminoids	80 "
Oil, Fat, Etc.	135 "
Mineral Matter	9 "
Sugar Coloring Matter	26 "
	900 grains

The remaining 100 grains of the 1000 are used in the shell, which contains about 50 grains of pure uncombined lime, the remainder being carbonic acid, water of chrystallization, etc.

Modern science is wonderful and helpful.

A. C. W. is a new food, some dealers do not keep it **yet.** If yours does not, write to us. We will supply you. All sacks sealed and guaranteed.

Poultry and Eggs Wanted

This sign you will see hanging outside of a merchant's store in nearly every town on the coast and it, in a measure, must convince you that there is money in the poultry business, and the

Chatham Incubators

will assist you in making money. Any responsible person can get a genuine **Chatham** and have SIX MONTHS TO PAY FOR IT—what is the use of you paying out money for an Incubator when you can make it pay over and over again for itself?

I can give you hundreds of testimonials from customers all over the Coast who purchased Chatham Incubators and Brooders last season on our **ON TIME PLAN,** and are thoroughly satisfied with them. The manufacturers fully guarantee every machine. Write me for our catalogue and some useful hints on poultry raising—it will be mailed to you free.

Geo. W. Foott, Box 2040, Portland, Ore.

mouth Rock hens one year old. In the month of May I set sixty eggs from those hens; 50 of them hatched four matured chicks failed to get out of the shell; eight eggs got broke in the nest and four appeared to be unfertile. All of the fifty chicks lived to be grown; every one of them was pullets, heavy bodies like the Cochin and Brown in color. They began to lay when six months old. I would like to know why there was no males among them?—Mrs. W. P. McC., Chino.

Answer. It is almost as difficult to know what sex will result from the mating of fowls as from any other animals.

Amongst my own fowls I have noticed that there is a larger proportion of females from hens just beginning to lay after a rest, and a larger proportion of males when mating a cockerel to old hens, but this might not be the case with your cross.

* * *

Cold Storage.—(Old Subscriber) Editor Cultivator: Can you give us a few hints in regard to placing eggs in cold storage? Can they be put in cold storage warehouses, say a single case at a time? It looks now as though eggs were going pretty low, in price and we do not care to give them away. Do you know any thing about the expense attached to storing them. By answering the above, you will confer a favor on.—J. B. K. E., Anaheim.

Answer. The Los Angeles Ice and Cold Storage Co., (4th and Central) will store eggs at 15 cents per case per month, or for fifty cents from now till next January, or if you have many cases they will make a very reasonable contract with you. You had better write to them.

* * *

WATER GLASS.—(J. M. B., San Jose, Cal.) Would you kindly tell me if dipping the eggs in the pure "water glass" will preserve them, without putting them in barrels and covering with the solution. Would you also tell me how this water-glass is made?

Answer: Dipping the eggs in the pure water glass will not preserve them, as the water-glass will run off and the air will get in. The water-glass is cilicate of soda. It is made at some chemical manufactory in the East.

BLUE ANDALUSIAN

Where can be found more beautiful or ornamental fowl than the above named? They not only have these qualities as a recommendation, but they possess the great merit of being prodigious egg producers, the characteristic of all Mediterranean breeds. Till quite recently they have not had the support from fanciers that they deserve, but now that their good qualities are becoming better known they are finding more supporters every day.

Messrs. Abbott Brothers, Norfolk, England, say, "We keep them entirely for egg production and find them such wonderful egg producers of both size and quality that we discarded the common barnyard fowl kept before. We took six pullets hatched in April and mated them with a cockerel on the 1st of August and kept them together until July 31st following, and the result of this experience was an average per hen of 234 1-2, or a total of 1,407 eggs."

I think it would be difficult to find a breed of fowl to beat the Andalusian. Of course there are Andalusians and Andalusians. The circumstances and conditions under which they are kept, the feeding and many other things affect their laying to a great extent.

Beginners starting this, or any other breed, should be careful in their inquiries as to the laying qualities of the stock from whence they get their birds, also when the purchase of eggs for setting is contemplated, the wisest plan is to apply to a breeder whose reputation is really the good-will of the business. They should be prepared to pay a good price. The best pays in the end.

The farmers would do well to invest in a few Andalusians of a good laying strain to improve their stock. The cost would be repaid in a short time.

L. C. Verry, London, England, says: "There are two ways which Andalusians can be successfully mated, but that which he recommendes as the most certain, and likely to produce the greatest percentage of blue chickens, and from which both sexes can be bred from the same pen, is to select light blue hens, with a fair amount of lacing, good in head points, mate these with a cockerel profusely furnished with rich glossy hackles and which well cover the wing bow; the breast and under-fluff being blue. The produce from these will be as nearly up to the mark as possible. It is not always that a pen like that can be procured without putting one's hand down well into one's pocket. The percentage of blue chicks really depends on the strain of birds you breed, and careful breeding is no longer a theory, but an accomplished fact with expert fanciers in spite of what some people may think to the contrary. From the best mated pens there will be off-colored chicks, but they are just as good layers. The chicks are very hardy and are particularly free from diseases. They feather very quickly and generally lay when from four to five months old."

MRS. T. R. GRIFFITH.

LAYING QUALITIES OF HENS

Editor Cultivator—I am preparing to stock with a few chickens. Will you kindly tell me something of the relative egg-laying and "eating" qualities of the Silver Laced Wyandottes, Barred Plymouth Rocks, White Plymouth Rocks and Buff Cochins. J. W. W. Bakersfield.

The laying qualities of Wyandottes and Plymouth Rocks are extra good. With proper care and management these hens will lay from 150 to 200 eggs per year and individual cases more than that. There is practically no difference in the laying qualities of Silver Wyandottes, or Barred, Buff or White Plymouth Rocks. Black Langshans also are good layers and on account of their heavy feathering, are supposed to be extra good winter layers. Buff Cochins will not lay as many eggs as the above-mentioned breeds, they have a decided inclination to persistent sitting. The eating qualities of Wyandottes, Plymouth

J. S. Smith, Box 526, San Jose, Cal.
YARDS—CORNER MOORE AND CHAPMAN STS.

Rocks and Buff Cochins are in the front rank. The Wyandottes are a little plumper than Plymouth Rocks when in the broiler stage, though they are a pound lighter when fully matured. Buff Cochins outweigh either by two or three pounds when full grown.

BROODY HENS

What disposition to make of broody hens is something of a problem. If your crop of youngsters is short, by all means put the hens to work to overcome the shortage. I have found the first three months of the year always gave me the best result, but have done fairly well with chicks hatched every month in the year except July and August, and my own experience has been duplicated by scores of breeders.

If you have hens that want to sit and you don't care to indulge them in their desires, don't resort to harsh measures to break them up. Some recommend driving a stake and tying the hen to it for several days. Others tell you to put them in a wash tub which contains about one inch of water and by forcing them to stand up several days they say the desire to sit will vanish. I have read of numerous other plans just as foolish and cruel. My plan is to take them out of their accustomed place and put them on a nice green lawn or anywhere conditions are entirely different from what they have been accustomed to. They are fed very sparingly, which forces them to put in most of their time rustling for subsistence. This plan rarely fails to bring the desired results and in three of four days they are returned to their old homes and are ready for business—egg producing. Young hens are more easily cured of the desire to sit than old ones. Occasionally an old hen persists in sitting—she will sit anywhere. In such cases use a little patience and remove her from place to place until she gives up as a bad job.—M. Cornett.

SHIPPING EGGS FOR HATCHING.

In shipping eggs for hatching too much care can not be taken in packing. An ordinary basket with plenty of excelsior in the bottom and the sides well cushioned makes an excellent receptacle. Into this the eggs, carefully wrapped, should be packed, and over them plenty of padding placed. Cheese cloth or cotton tacked over the top forms a satisfactory covering. Such a package, conspicuously labeled "Eggs for Hatching," can be shipped any distance and will reach its destination in good condition. Upon receipt of the package the eggs should not be removed until the hen or incubator is ready to receive them, but the eggs should be turned over daily.

LINES TO THE HEN

"Ed" Blair of Cadmus, Kan., known locally as "the melodious poet of the Osage," has written the following lines to the hen:

Cackle, cackle, Plymouth Rocks,
Ye can have the wagon box,
'N' the smoke house, 'n' the barn,
Take 'm—we don't care a darn.

Cackle here and cackle there,
Lay your eggs just anywhere.
Every time you lay an egg,
Down the mortgage goes a peg.

Cackle, cackle, all the day,
Who kin find a better way
For to get ahead again
Than to cultivate the hen?

PETALUMA, CAL., JAN. 1, 1906.
TO WHOM IT MAY CONCERN;

As the chicken raising season is at hand, we beg leave to call your attention to a few of our specialties.
Do you need an Incubator? Our machines are fully guaranteed and have proven themselves unsurpassed wherever used.
Do you need Brooders? We manufacture just what you want; fully guaranteed, made of the finest material and of the best possible workmanship, and, above all, a practical machine which saves the purchaser money, time and labor.
Do you need Poultry Supplies of any kind? We manufacture a line of Supplies the use of which makes Poultry Raising not only profitable, but a pleasure. Among our specialties are:
Our Water Fountains; our Self Feeder for Chicks, our Feed Troughs, large and small; our Lamp Fillers.
Our convenient Must Hatch Nest Boxes; our safe and sure Must Hatch Insecticide our sanitery Must Hatch Disinfectant, our sure death Must Hatch Lice Exterminator, our Poultry Compound, a fine Spring and Fall Tonic.
In connection with the above list, all of our own manufacture, we can also furnish the following, which are indispensable to the Poultrymen:
The No. 128 Clover Cutter, the Enterprise Bone Mill, the Ohio Feed Cutter, the Banner Root Cutter, the Enterprise Feed Chopper, the Ideal Duplex Feed Mill, and the Farmer's Boiler.
Do you wish to make your own Incubator or Brooder? We can furnish you all the necessary parts for making an Incubator or Brooder, also plans for the best and most practical Poultry Houses.
Did you ever purchase Just Hatched Chicks? We have a Hatchery of 50,000 chicks per month capacity in operation the year round and have, for the past few years. been successfully shipping, in our specially constructed carriers, just hatched Chicks, to distances as great as 2,000 miles. If you need them, book your order early, as our future delivery list is rapidly filling up.
We can also supply White Leghorn hatching egg in quantities desired. If you have not already received our catalogue, write for Catalogue B, and you will find therein a more detailed description with prices, etc., of the above.
Hoping to hear from you in the near future, we are,
Yours Very Respectfully,
MUST HATCH INCUBATOR CO.

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles.

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

BARREN COW

Dear Sir:—I have a valuable two-year-old heifer which has been bred a number of times, but fails to get with calf. I have tried different bulls but with no success. What can I do to remedy the difficulty? Please answer through the coulmns of the Cultivator. W. Riverside.

There is occlusion of the canal leading to the uterus the os. This can be remedied sometimes by smearing the hand with oil, inserting it into the vagina cone shaped. You may be able to dilate the parts with the finger, making an operation into the uterus. I often found it necessary to use a sound, a steel instrument made for the purpose before I could affect an opening.

This should be done when the cow comes into heat. Then breed her the same day.

ELEPHANTITIS.

Editor Cultivator: I have a horse that has a swelled hind leg from the ankle up to the body; keeps gathering in abcesses, and breaking out, has now extended to front leg; the legs are left ones; called a local veterinary up, and he said it was elephant leg or elephantitis; he is fed on alfalfa hay, and has not been worked for four months on account of leg; he is in good health in every other way, and is a very willing and gentle horse; he is about 10 years old.—J. A. R., Fresno.

Your veterinary made a correct diagnosis of the case. This is incurable when it gets to the stage you describe. You could give the horse a physic and treat the sores with Copper's water and the horse could do slow work.

BARRED BEAUTIES.

One of the most enthusiastic admirers of the Barred Rock in this State is H. R. Campbell of Petaluma. He is also a conscientious breeder of them and he understands the science so that he is producing some which are of finest feather and such indefatigable layers that they prove profit winners.

At a recent San Francisco show the judging was by Judge Holders, one of the best Barred Rock specialists in the country and under his judging Mr. Campbell won: First cockerel, first and fourth hen, and second cock and fifth pullet, and every bird his own breeding.

Mr. Campbell follows the double mating plan entirely and shows results for his careful work.

At Alameda his winnings were much the same as at San Francisco. His prices for some of his choicest matings of prize winners seem high at first, for they are $5 per sitting. But when we understand what the care required to produce such fine birds he may appreciate the fact that the price is not simply for the fancy, but compensation for much hard work. Other pens of fine birds, almost perfect in markings and strong of constitution, furnish eggs which may be had at $2.50 per sitting.

J. H. Gulich is advertising native stock grafted walnut trees in the Cultivator.

VALUABLE RAINFALL CHART.

Southern Californians may get a world of information from a "Comparative Rainfall Chart for Southern California,' which is issued by the Security Bank of Los Angeles. This chart gives the figures and in a colored diagram the rainfall at Los Angeles for every month from July 1881; also the average for each year since that time, and the seasonal averages for 26 years of Los Angeles, San Bernardino, Riverside, Orange and San Diego counties. This chart, which is just issued. carries these figures up to this time, or rather, to Feb. 1st, 1906. It is most valuable because of the fact that the diagram gives, at a glance, a comparison of the various years.

Following the rainfall chart is another diagram which shows the increase of deposits in the Security Savings Bank since January 1st, 1898. In a word the increase has been from $1,194,283.00 to $13,503,029.25. This leads us to say just a word regarding this magnificient institution. It is the largest savings institution in California, outside of San Francisco and Oakland. It was organized in 1889, and we believe it is safe to say that its remarkable growth is due to the careful attention observed in the managing of its large business. It has a paid up capital of $330,000.00. Surplus and profits of over $325,000.00, and total resources of over $14,500,000.00. While it is a savings bank and restrictive in its loaning, yet, it has a large number of personal checking accounts, but of course, its principal feature is its savings and real estate loan department.

A committee of ten directors meets weekly to investigate and approve all loans. The bank employs an expert appraiser and no more than forty per cent. of a conservative value of the real estate is loaned, thus insuring what is most important—the safe investment of the depositors' funds.

The Security Savings Bank, desirous of extending its facilities, and to accomodate those living at a distance, has adopted a system of banking by mail, which solves the problem of safety and profit, regardless of where one resides. The mails have proven eminently safe, and under this simple and practical system you can have the benefit of the security and profits of an account with one of the strongest banks in the Southwest.

If subscribers of the Cultivator will write the bank and request a copy of the above mentioned rain chart, it will be sent free of charge, and we do not doubt, if requested, a beautiful illustrated little pamphlet with further information regarding the advantages of banking by mail and at the same time having the money where absolute security is insured, as well as a fair rate of interest will also be sent.

BEE KEEPERS SUPPLIES

When in Fresno recently it was the pleasure of the writer to look over the extensive mills of the Madary Supply Co. These mills are fitted for turning out almost everything in the line of wood work, but are specially supplied with all appliances for the needs in the apiary. As extensive as these mills are at Fresno, the principal distributing point is in a supply house branch at 737 Aliso St., Los Angeles. This house is in charge of Mr. G. M. Clayton, who has the entire management. It has easily the largest and most complete stock of bee keeper's supplies to be found west of the Rocky Mountains. Mr. Clayton will be pleased to send a catalog of everything which pertains to bee culture to those who are interested and inquire for it.

ChinoRanch

The great Chino Ranch is located in one of the most fruitful valleys in the world, 35 miles east of Los Angeles, adjoining the progressive cities of Pomona and Ontario.

It is one of the few agricultural districts in Southern California where small capital can accomplish **big results**—where men of integrity and industry can wrest independence from a responsive soil, where a never-failing water supply, proper climatic conditions, Agricultural Station advantages, adequate railroad facilities, dependable markets, modern rural improvements and ideal social conditions, all unite in making Southern California ranch life just what it should be **—a Supreme Success.**

Alfalfa, onion raising, sugar beets, walnuts ard fruit culture are bringing big profits to Chino ranchers.

The ranch may be visited any day under our auspices. Trains leave daily from Los Angeles (via the Southern Pacific) at 8:05 a. m. and 5:25 p. m.

An unlimited Certificate of Title may be secured from the Consolidated Abstract and Title Guarantee Co. of San Bernardino, Cal., by all purchasers of Chino lands.

Queries and Replies

CORN WORMS.

Editor Cultivator: What can be done to head off the worm eating into the ear of sweet corn when green? Would flowers of sulphur help if sprinkled on the young ear?—C. A. McD.,—Beaumont.

This question was sent to the University of California and answered by Prof. W. T. Clarke, as follows:

The question enclosed in reference to the controling of the corn worm is as yet not fully solved. We can say positively however, that the use of flowers of sulphur sprinkled on the young ears does not in any wise control or destroy the worm. Probably the most satisfactory material to use for this purpose is Paris green and hydrated lime in the proportion of one of the Paris green to three of the lime; this to be sprinkled upon the ears dry. A certain amount of relief can be obtained by this method of work. Unless late corn is desired you will find it desirable to plant the corn very early so as to avoid the later heavy broods of the moth laying eggs from which spring the worms. It is also advisable to use varieties of corn that are set irregularly upon the ear. The so-called Country Gentleman and the Zigzag evergreen varieties are very satisfactory in this connection; the idea being that the majority of the worms enter the ear at the outer end. If the rows of grain are regular on the cob then the worms will follow down one of these rows and badly damage the ear. If, however, the grains are irregularly placed then the worms confine their attention usually to the outer end of the ear and the damage is concentrated in this situation. I wish I could give you rather more definite information in this matter, but the insect in question is at present being investigated and studied and we as yet consider that the work is in an experimental stage.

JUST ANTS

Editor Cultivator.—Will you please tell me through the columns of your paper how to get rid of little red ants in a hot bed. also in the house. The ants infest the hot bed and flower beds to the extent that they carry off nearly all seeds planted. I've tried everything I ever heard of, but so far the ants are ahead. They get more numerous every year. Mrs. G. W. H., Reedley.

One ounce of arsenic to one quart of water; boil until reduced to one pint; add one-half pound sugar, mixing well. Put this in a saucer or similar receptacle. This preparation is deadly poisonous to all animal life and care should be exercised in its use.

Punch holes about a foot deep with a stick at three or four points near the center of the nest; pour into each about an ounce of the bisulphide of carbon and close the openings with the food. The vapor will get into and follow the galleries and kill the ants. A second treatment will rarely be necessary.

A weak solution of carbolic acid is another easy and inexpensive liquid for pouring in the nests.

GARDEN SNAILS

Editor Cultivator.—Will you please tell me if there is any way to get rid of the snails. They are very numerous in my garden, and eat the vegetables as soon as they appear above ground. Could have a nice garden only for them. Kindly answer in your next paper and oblige a subscriber. M. E. E., Santa Rosa.

The writer has tried every remedy brought to his attention and found none sufficiently effective except hunting them out and killing them. Our best practical gardeners seldom resort to any other method.

WALNUTS

M. H. S. (Long Beach?) We think the Placentia Perfection will do as well as any with you, but we would not recommend planting walnuts on the mesa you suggest, though you may have some measure of success.

LICE ON CATTLE

Editor Cultivator.—What is the most effective and most simple method of getting rid of lice on cattle, especially little calves. Both the black and red lice. Subscriber, Fresno.

A quarter pound of tobacco dissolved in a gallon of water by heating, and well rubbed into the hair will drive away lice, so will coal oil, but it is liable to take out the hair.

NATIVE WALNUTS

Editor Cultivator.—Can you refer me to anyone who could furnish me or inform me where I could get some Black Walnuts from a prolific, thrifty tree. California Native preferred. I want them to grow stock for grafting. G. E. B. Santa Ana.

You had best collect your nuts in the hills about Santa Ana. There are plenty in the Santiago section. It will doubtless make but little difference what kind of a tree they are from, though there is no use "flying in the face of Providence," so we would choose them from the best tree to be found. Nearly all native walnut trees in the Southern part of the State are small, though there is but one species.

TEMPERATURE OF CREAM

Editor Cultivator.—Please tell me what the temperature of cream should be at the time of churning to insure best results. Mrs. F., Nordhoff.

Fifty to fifty-four degress we have used for years as a churning temperature. I find some creamery churning as low as forty-five degrees and others at sixty, so it really is not a matter of as much moment as having the proper degree of acidity to obtain uniform results.

GOPHER POISON.

Editor Cultivator: I am a subscriber to the Cultivator and I would ask if you would please give me a good remedy for getting rid of gophers and squirrels in the vineyard and orchard?—J. R. M., El Cajon.

Read the Cultivator of last week. J. B. Neff gave a poison remedy which is what you are asking for.

CRIMSON WINTER RHUBARB

To Mrs. M. E. G., and others we will say that we believe the Crimson Winter Rhubarb is all that is claimed for it. We know of growers who have made immense profits from the marketing of the stalks.

LOSS OF MILK

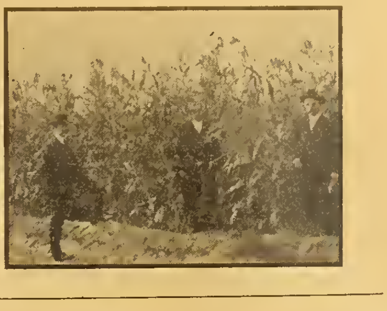
Editor Cultivator:—We have a good gentle cow that was giving about two gallons of milk daily. On the evening of January 31st she gave her usual amount of milk and on milking her the next morning she was completely dry with the exception of two or three weak squirts not amounting to over half a teacupful .She kept that up for three days, but is now coming up very slowly. Her bag did not show any signs that she had sucked herself and no one could have milked her during the following days, which we had thought might have been done during the firts night. The cow did not appear to have had any severe fright during the night as she was as calm and gentle as usual. There is six other cows kept in the same field with her. W. Watsonville.

Possibly some of the other cows are milking her, as she is very gentle. Test this by covering her udder with a gunny sack tied on with a surcingle and steadied with a back-strap. If this proves not to be the case then the next thing to be looked to is that she may have fever. Try her temperature by inserting a thermometer into the rectum. This can be done with a gentle cow by greasing the bulb and inserting it so gently that the cow does not object. The normal temperature of a cow is 98-99 degrees. If she shows fever and you are sure she has cleaned alright and has not abort give her quinine in ten grain doses twice a day and every other day give her a pound of glauber or epsom salts with two tablespoonfuls of ginger. The cow may be a cow that is accustomed to go dry at this time and if that is so she will dry up in spite of feed.

CALIFORNIA SUGAR CANE.

Those who think that good growth in sugar cane is confined to the land where dwells the "sabled-hued son of the sunny South" may have such ideas upset by a careful look at the accompanying illustration.

Here is shown a field sugar cane, growing near Corcoran in Kings county, only sixty days old and more than nine feet high. Such growths are not rare by any means for many of the farmers in that rich section have had equal or better results in growing sugar cane with which to feed their stock. It is highly probable that this class of fodder will be extensively used in the future for it seems wonderfully adapted to the soil and climatic conditions around Corcoran..



NUT GROWING IN OREGON.

Mr. J. B. Pilkington in the biennial report of the Oregon State Board of Horticulture says that nut culture will become a permanent industry in that state.

Especial attention is given to the culture of filberts and English walnuts. In the former the shrubs at 9 years old bore 25 pounds each of filberts. In walnuts it is advised to grow only grafted, late blooming French varieties. Those blooming early are nipped by frost and produce no nuts.

Tree Protectors

75c per 100. $5 per 1000.

As valuable in summer against sun-scald, hot winds, etc., as they are in winter against cold and rabbits. Recommended by all leading orchardists and horticultural societies.

Send for samples and testimonials. Do not wait till rabbits and mice ruin your trees. Write us today. Wholesale Nursery Catalogue now ready Write for copy. Agents wanted everywhere.

HART PIONEER NURSERIES
Fort Scott, Kansas

VULCANITE ROOFING

JUST THE THING ALL THE YEAR ROUND

Non-conductive of heat and cold. Does not buckle—lays perfectly smooth. A material which is at once light, strong, durable and cheap, and at the same time water-proof, wind-proof, acid and fume-proof. Also used for covering outside of buildings, floors of warehouses, offices. etc. Requires no paint; is permanent and inexpensive. Comes in various weights.

Samples and price list upon application.

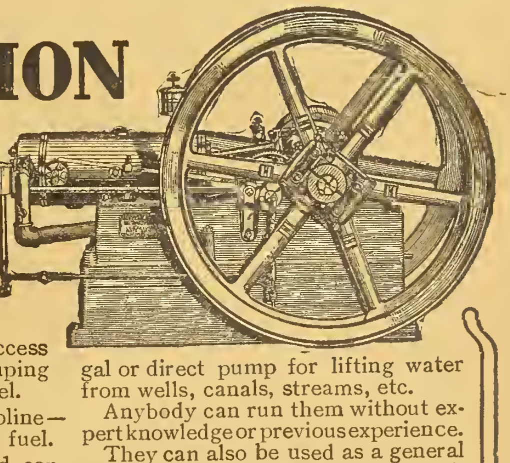
LOS ANGELES, CAL.



FOR IRRIGATION By PUMPING

For all those who wish to irrigate by pumping, the I. H. C. gasoline engine is the one best power.

The difference between success and failure in an irrigation pumping plant is often a question of fuel.

The I. H. C. engines use gasoline—a cheap and easily transported fuel.

They take the least fuel and convert it into the most power.

They are unequalled when put against a steady load as in pumping, and sustain their full rated power with persistency and regularity.

They can be belted to any centrifugal or direct pump for lifting water from wells, canals, streams, etc.

Anybody can run them without expert knowledge or previous experience.

They can also be used as a general purpose engine for sawing wood, cream separating, feed grinding, etc.

They are made in several styles and sizes—

Horizontal and Portable—4, 6, 8, 10, 12 & 15 Horse Power.
Vertical—2, 3 & 5 Horse Power.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

ABRAHAM LINCOLN.

This man whose homely face you look upon
Was one of nature's masterful great men;
Born with strong arms, that unfought battles won,
Direct of speech and cunning with the pen.

Chosen for large designs he had the art
Of winning with his humor, and he went
Straight to his mark, which was the human heart;
Wise, too, for what he could not break, he bent.

Upon his back a more than Atlas load,
The burden of the Commonwealth, was laid;
He stooped, and rose up to it, though the road
Shot suddenly downward, not a whit dismayed.

Hold, warriors, councilors, kings!—all now give place
To this dear benefactor of the race.
—R. H. Stoddard.

The Reversion of Pauline.

It was sunny where we sat at Sutro Heights, between the white statutes of Prometheus and Femme au Serpent. At our left, stretched a smooth, red road.

"The road of love, and it leads to Paradise," I remarked.

Pauline was silent. Her dreamy eyes gazed beyond the little waves lagging in toward shore, out to the bank of fog which circled the waters as if to shut us two, there in the sunshine, away from the whole world. My glance lingered on Pauline's rippling brown hair, on her straight little nose, on her mouth; and I gave one long sigh of content.

"Pauline," I said, "will you marry me?"

"No," she answered.

Her tone was caressing, but it held uncompromising firmness. The fog was coming closer in.

"Why?'

Pauline turned her gray eyes from the ocean to me.

"One thing thou lackest," she quoted softly. "Go sell what thou hast and give to the poor.

I stared blankly at her. Was this child of luxury, this butterfly of fashion turning preacher.

"I don't say it's original, Elbert. For generations back there's been, every now and then, some one of our family who has believed and practiced it. I suppose the mantle of these peculiar ancestors has fallen on me, for it has been a life principle with me."

"Maybe I'm dense, but I confess I don't see—"

"I have more money than I know what to do with. So have you. It is absurd for us to marry, and put all our money together. It isn't right. You must choose some poor girl, and I a penniless man."

"Nonsense!"

"I really mean it.'

I reasoned with her for an hour and at the end of the time I left her looking at the ocean, her eyes wet, but her chin determined. Her chauffeur looked at me inquiringly as I strode past her auto car which had brought us both. I jammed my hat down viciously and started along the red road but it no longer led to Paradise. It was no "road o' love," and there was no Paradise anywhere.

"And the young man went away sorrowful, for he had great possessions."

It's amazing what a good night's sleep will do for a man. Next morning I had interview with my lawyer. It was tedious and somewhat embarrassing, as I had to explain some things I should have preferred to keep to myself. It was over at last and I sought Pauline.

I found her in the rose garden writing rapidly. When she saw me she sprang up, scattering her papers on the grass. She smiled at me tearfully.

"I discovered that I couldn't live without you," I said taking her into my arms. "I could have given away a dozen fortunes rather than lose you."

I felt her start.

"Given away, Elbert," she repeated. "You haven't given away—"

"Every cent," I cried gaily, leading her to a seat. "Just got the business finished. I'm your penniless man; now when will you marry me?

She stared at me, her eyes round and amazed. Then she laughed nervously.

"I have. too," she gasped.

"Have what. darling?" I querried.

"Given everything away. I was just writing to you to tell you that I cared more for you than for my wretched money: and it's all gone, gone, gone."

"Never mind, little girl. We have each proven our love. Now we will start in and live as our grandparents did. I will buy a ranch—"

"My grandparents didn't and you haven't any money, Elbert."

"Oh, that's so. Well, I will go and work for a rancher, then, and you can help the rancher's wife. You can make butter, and feed the hens, and—and fatten the pigs, can't you?"

She held up her little white hands and I covered them with kisses. Then she put them, one on each side of my face, and looked steadily into my eyes.

"Elbert, I will try if the rancher's wife will have patience with me."

"To whom did you give your fortune?" I asked, after a minute.

"To the church for an orphanage." Her lips were quivering again, so I said hastily:

"Well, sweetheart, go put on your plainest gown, as befits a poor man's bride, and we will go at once to the parsonage."

I laughed when she came back. Her "plainest gown" was simple and white but probably cost as much as I could earn on the ranch in a year.

"The minister lent me the money for the license, and has promised to wait until I get my first month's wages for that and his fee," I explained, as we walked along.

Pauline's face flushed and she looked up piteously.

"Didn't you save out enough for the ring—my wedding ring?" she whispered.

"Made a clean sweep of everything." I answered cheerfully, "except my clothes. I didn't think my —er—beneficiary would care for those."

She gave a patient sign.

"You will get me a ring as soon as you can, won't you, Elbert? I shan't feel married without a wedding ring."

"Sure, little girl," I answered huskily, as we reached the parsonage.

When my wife and I emerged from the minister's gate, I looked at her inquiringly.

"Well," I said, "probably we had better start at once for the country."

My small wife raised her hand with a charming assumption of dignity.

"Indeed, we shall not. We will go home until such time as we choose to go. The church can wait till we are quite ready to depart."

That evening as we sat in the rose garden, we were joined by Mr. Layton Pauline's lawyer.

"May I inquire as to your plans for the future?" asked the lawyer.

"We are going to the country to find work," Pauline began bravely, "You see, Elbert did just what I did—gave his money away. He came here to tell me, and I was writing to him. Wasn't it a funny coincidence?"

"Very," said the lawyer dryly.

My wife folded and unfolded her handkerchief. The lawyer gazed into space. Pauline sighed and Mr. Layton cleared his throat.

"And you expect to enjoy drudgery instead of luxury, do you?" he asked with the suspicion of a growl.

"It isn't a matter of liking," Pauline answered quietly. "Elbert did it because he cared a great deal for me; I did it because I loved Elbert, and I thought it was right. Of course, neither of us thought of the other's sacrificing; but it is done and we are going to make the best of it."

"I see. Would it disappoint you too much if your property were still yours?"

Pauline gasped.

"I thought you'd be sorry, so I made up the message from the church. As the church doesn't know what she missed she will be able to endure it.'

Pauline gave a joyful cry. "Oh, Elbert, I needn't wait a month for my wedding ring!"

"My wife buy her own wedding ring?" I asked fondly, wishing the lawyer were in Mexico for a moment.

"No; I'll have my property made over to you dear."

Mr. Layton turned to me. "May I inquire, sir, to whom you made over your property? Was yours given to charity, also?"

"I didn't think so at the time I did it," I responded smilingly. "It is in the name of Pauline Mowbray, spinster. I suppose her subsequent marriage—"

Pauline's face was close to mine.

"You precious, old, deceitful goose!" she said.—Ina N. Nelson.

OIL NEW SHOES.

When you buy a pair of heavy working shoes give them a good oiling before using. This will soften them, keep the water from the leather and make them last twice as long as if left to become dry, hard and wrinkled. Keep all places that begin to rip and wear through sewed and patched.

Santa Fe

COLONIST RATES
TO CALIFORNIA

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leovenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearlo all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California wili take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California iilustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist leeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

Cookery Recipes

DOUGHNUTS

To 1 cup sugar add 1 cup sour cream in which dissolve 1 teaspoon soda. Then add 1 cup sweet milk and flour to make a stiff dough.

* * *

BREAD CAKE

Into 1 cup light bread dough beat half cup butter, 1 cup sugar, half teaspoon cinnamon, and a little nutmeg. Let rise and then bake. If liked, add half cup chopped and seeded raisins, or currants.

Line a pie tin with a good crust and bake. When wanted, fill with the following mixture: Boil together 1 heaping tablespoon butter and 3 cups milk and then add 3 level tablespoons cornstarch dissolved in a little cold water or milk. Boil until it thickens, then remove from fire, stir in juice and grated rind of lemon and sugar to taste. Fill the pie crust and serve when cold.

* * *

LAYER CAKE

One cup sugar, one-fourth cup butter, three-fourths cup rich sweet milk 2 cups flour, two and one-half teaspoons baking powder. Flavor with vanilla and bake in three layers. Frosting: 1 cup sugar, 5 teaspoons milk, half cake sweet chocolate. Boil 6 or 7 minutes, then take from fire and add half teaspoon vanilla.

* * *

JOHNNYCAKE

One pint thick sour milk, half cup molasses, 1 teaspoon soda and 1 of salt, 2 cups Indian corn meal and 2 cups flour.

* * *

CREAM PIE

One cup sugar, half cup lard, 1 teaspoon salt, 2 teaspoons baking powder, 1 cup milk, two and a half cups flour, I teaspoon vanilla. Cream, sugar and lard, add milk, sift baking powder into the flour, mix all together and make in two round tins. Whip half pint of cream stiff, sweeten with 2 tablespoons confectioner's sugar, and add quarter of a teaspoon vanilla. Spread between cake.

* * *

COFFEE CAKE

Cream three-quarters cup butter and 1 cup sugar, add 1 cup molasses, 1 teaspoon cinnamon and half teaspoon each of cloves, nutmeg and salt. Dissolve 1 1-2 teaspoons soda in a cup of strong coffee and add to the mixture. Beat in 5 cups flour and 1 cup raisins. Butter should be stiff. Add more coffee, or put in less flour, if necessary.

The Family Doctor

THE WORM DOCTOR FAKE.

The following article from the "S Cal. Practitioner" will be of some interest to our readers, as not a few of them we presume have been misled by this same fakir. Wall Street and the Insurance offices are not the only places where the public are skinned, as this story shows.

"The specimens of worms here shown were supposed to have been passed by a patient of mine as the result of treatment, given by a well advertised "Worm Doctor" of this state.

This patient being in somewhat indifferent health, on the advice of a friend consulted this "Worm Doctor." After due examination the "Doctor" said he had worms, and promised to convince him by the production of them. If he could not, he would not charge him anything; but if he did, he would cure him for a certain sum, and guarantee to cure him any time if they returned in the next five years. This seemed a reasonable offer so he agreed to take the treatment.

The latter was conducted as follows: About noon-day a small glass of dark colored liquid was administered and he was told to return at 5 p. m. At that hour another glass of the liquid was given. A fountain syringe was then ostentatiously cleansed and filled with warm water in his presence, a glass of medicine was added thereto and the whole administered in the form of an enema. The amount introduced was so considerable that he had to get very hurriedly to the vessel. The enema acted freely and to his horror it seemed that five hundred worms were wriggling around in the vessel. Probably there were fifty. At all events, he secured half a dozen and these are here shown you. It requires no specialist to tell you that these are strange worms to be passed by a human being. I thought they were the larvae of the common blue-bottle fly, but to make certain I sent them to the Smithsonian Institution with a note, saying they were supposed to have been passed in the bowel movement of a patient.

The reply of Dr. Howard, Director of the Entomological Department will interest you:

Dear Dr. Davidson:

"Referring to your letter of the 3rd instant, addressed to Mr. Coquiliett and accompanying larvae, said to have been passed by a patient, I would reply as follows:

" Mr. Coquillett thinks that the larvae is Musca Domestica, and I have submitted it also to another expert assistant who says that it is undoubtedly a Musca. As you no doubt know, Musca Domestica (the common house fly,) will ovi-deposit abundantly in human excrement, and the evidence must be very careful before we can accept the statement made in your letter. There is no record of these larvae having been passed from the alimentary canal of a human being."

"Yours most truly.

L. O. HOWARD
Chief of Bureau.

The "worms" were probably introduced into the chamber when the enema was administered, and so adroitly has this been managed that for years this fakir has been producing "worms" from the gullible public all over California.

The "Doctor" informed this patient that these were "liver worms" and this was probably true, as they are as conveniently and freely produced in a piece of putrid liver as in any other medium.

* * *

Fresh Air.—Most people do not know the value of fresh air in their sleeping rooms. They put the children in bed, in small rooms, close all the windows and often the door and thus exclude all ventilation, and then wonder why their children have colds. Fresh air, not draughts, however, is as necessary to health as wholesome food. The children play out of doors all day, eat a hearty supper and go to bed. If they haven't fresh air, plenty of oxygen to produce digestion they take cold and serious complications, like as not, follow. Fresh air is Nataure's doctor, draughts its enemy, and the more big and little people can get of it the healthier they are.

A HINT TO THE WISE.

Never enter a home smoking or with tobacco in the mouth.

When a visitor always observe, even at personal inconvenience, the laws and customs of the home.

Rose water, five ounces, glycerine, one-half ounce, and lemon juice. one ounce, makes a whitening and healing lotion for chapped hands.

When walking keep the chest elevated and breathe deeply through the nose. A long walk may then be taken without exhausting effects.

Nuts should be eaten in the winter time. They are extremely rich and nutritous, vegetarians using them in place of meat and butter.

Avoid excessive use of all condiments, pepper, mustard, etc., as they will in time detroy the digestion.

Salt water acts as a tonic on the skin. Gently spatted on the face it will make the cuticle firm.

For a burn take the white of an egg. By excluding all air and forming a covering over the burn the pain is instantly relieved.

Tender feet should be bathed in alum water. If colored hosiery is worn have the soles and heels white. Tender feet are made more sensitive by the dyes used in stockings.

After exercising or bathing when the pores are open and the skin is in a glow, do not rush out into the open air or into sudden changes of temperature. Severe colds are taken unless good judgment is exercised at such times.

Manners are of more importance than laws, being the foundation stones of civilization.

Simplicity of manners shows the best breeding. Effusiveness and loudness are stumbling blocks of good manners.

When drinking from a cup the spoon is left in the saucer. It should never be left for a moment in the cup, being used only to stir and dissolve the sugar.

In most cases it is only necessary for a woman on being introduced to bow politely and repeat the name of the person presented.

At dinner or any meal if a guest upsets a glass or any accident occurs, he should offer a few words of apology which the hostess will similarly accept and endeavor to relieve his embarrassment by immediately detracting attention from the accident.

When stopping to talk for a moment with a woman on the street it is not necessary for a man to remove his hat and stand with head uncovered; the hat should be raised, slowly replaced and again lifted as the conversation is ended and he withdraws.

In pressing trousers turn wrong side out, spread flat, moisten the knees thoroughly, and press each leg carefully with a hot iron. Then turn, fold with long seams on the legs exactly together, cover with a damp towel and press each separately.

REGARDING PHYLLIS.

She hath a dimple in her chin,
All hedged about with kisses;
And Cupid lies intrenched therein,
A wee sharp shooting manikin
Who very seldom misses.
—Philadelphia Press.

"I took a long walk yesterday," said Boreman, as he took a seat by Busyman's desk.

"Take another, old man," suggested Busyman, "it'll do us both good"

SURE-GO Gasoline Engine

Manufactured by the Wogaman Mfg. Co. Greenville, O.

The Sure-Go is of the latest and most improved design, has fewer working parts than any other Engine on the market, therefore lasts longer. So simple is its construction that any child can operate it. It can be used in any work as it rests upon skids, can be easily moved from place to place, thus of great value to the ranchman or farmer. This Engine is four cycle, four horse power capacity, and can be delivered at a price that will astonish you, it is so cheap.

Anyone interested in Gasoline Engines will find something to their advantage in labor saving and money saving, by communicating by letter or in person.

The Produce Markets

Los Angeles Markets.

Los Angeles, Feb. 22, 1906.

Butter has taken the expected decline and two pound rolls are now quoted 10 cents lower than last week's quotations, and a further slump is not probable.

Eggs remain as quoted, but the supply is scant, as poultrymen are holding their stocks for higher prices.

Potatoes of an inferior grade are in heavy supply, but choice grades are quickly taken at top quotations.

Abundant green feed has forced down the price of hay, most varieties suffering a decline of a dollar or more since last week.

"Sheds water like a duck's back"

An ideal roofing must be absolutely water-proof, practically fire-proof and alway weather-proof.

Rubber Sanded Roofing

Is proof against everything an ideal roofing should be proof against. Water flows off of it as fast as it falls. It is practically a fire-proof roofing—cinders, sparks or blazing brands falling upon it will burn themselves out, without injury to the roof. It is weather-proof in every climate. A building is warmer in winter and cooler in summer, than under any other class of roofing, because it is a non-conductor. Be sure to investigate thoroughly, that

Wear-Proof Surface of Clean Flint Sand.

"Pioneer" Rubber Sanded Roofing is put up in rolls —ready to lay and is easy to put on. A complete kit of roofing supplies is furnished with each roll. Our Booklet "D" will tell you all about the roofing question. Send for it today.

CITRUS MARKETS

There has been little fluctuation in the Eastern citrus markets during the past week, in fact, for several weeks. Both prices and weather have been uniformly good.

NEW YORK, Feb. 20.—Twenty-five cars were sold at auction today. The market is very strong and prices are practicallly unchanged. The weather is favorable.

Climate and Crops

General Summary.—Warm, cloudy and showery weather prevailed nearly all the week throughout the State, with heavy rainfall Wednesday and Sunday in some sections. In the northern part of the State the rains caused a rise in the rivers, but no damage was done.

Farm work was somewhat retarded by frequent showers, but the rain was very beneficial to all growing crops. Grain made good growth, and is looking strong and thrifty. Present prospects are that the grain and hay crops will be fully average in all parts of the State, while in some sections the yield will probably be much above average. Plowing and seeding are completed except in a few places. The grain acreage as a whole is about the same as last year. Work is progressing in hop fields and sugar beet planting continues. Green feed of good quality is abundant except on some of the high ranges and stock are in good condition. The seasonal precipitation in the central and northern section is still below average, but the rainfall since the first of the year has been remarkably well distributed and at present is sufficient for all purposes.

Deciduous fruits are rapidly blossoming in all parts of the State, and give promise of good crops if not injured by late frosts. The season has been very favorable for fruits, grapes, and walnuts, and the yield of honey in Southern California will probably be one of the largest known. Orange picking and shipping are in progress in the south.

Eureka Summary.—Crops made rapid growth and warm rains gave gave grass new life. Large acreage sown to grain: prospects good for exceptionally heavy crop. Most farmers are through plowing. Stock are improving.

Los Angeles Summary.— Warm weather without drying winds, following the rains, gave great impetus to crops, which are doing well, with promise of an exceptionally good season. Ground is being prepared for beet planting.

VENEERED TREE PROTECTORS

Our readers will notice an advertisement of the Hart Pioneer Nurseries, of Fort Scott, Kansas, in this issue, calling attention to their Veneered Tree Protectors.

We have seen a sample of these protectors, and judging from the high class testimonials that this firm furnished, they evidently are a good thing and will do all they claim of them, such as protecting the trees from mice, borers, rabbits, hot winds, etc.

We notice testimonials from some of the largest orchardists in the country, who are using them. also from leading agriculturalists and secretaries of many agricultural societies, advocating the Protectors.

If any of aur readers have orchards to protect, they will do well to correspond with the above firm and get their circular and samples.

Mr. E. G. Wood, the owner of the oldest established orange nursery at Alhambra, still has a number of Washington Navel and Valencia trees on hand. These he guarantees to be true to name and to be inferior to none produced in this State. They are three-year old buds and four-old roots. At the rate orange trees are being picked up it is well to get in touch with him early, before the best are all sold.

Mrs. Albert Martin, whose poultry yards are near East Lake Park, Los Angeles, has a few pens of fine Barred Rocks and Buff Orpingtons from which she has a few settings of eggs for those who wish fine stock.

As a specialist in the grafting of walnut trees, Mr. E. F. Richman. of Orange County Nurseries, Fullerton, has made a success, and has a quantity on hand for this year's planting. Mr. Richman also has on hand a full line of citrus and deciduous trees as well as a full line of ornamentals. A card to him will bring a price list.

The California Carnation Co., of Loomis, Cal., advertise one of their specialties this week. "Burbank's Phenominal Red Raspberry." It will be worth while to write them for prices and particulars and mention seeing their notice in the Cultivator.

Klonniger Bros. of Los Angeles, are in the Cultivator with their business announcement this week. A good firm and one that is building up a fine business in poultry supplies.

Mrs. S. H. Church advertises a fine strain of White Wyandotte eggs for sale this week.

H. S. Thompson advertises Barred Plymouth Rock and Indian Runner duck eggs for sale. See poultry pages.

If interested in turkeys read advertisement of Mr. N. Frank Morse, in this issue.

CANCER

IN WOMAN'S BREAST
ANY LUMP IS CANCER

Mailed Free—How to Cure Yourself if Cancer is Yet Small—No Pain.

NO PAY UNTIL CURED—GUARANTEE—
JUST SEND YOUR NAME

MRS. E. CROSTHWAITE,
954 Arlington Ave., Oakland, Cal.,
President Golden Gate Woman's Club,

Dear Dr. Chamley—I will state, your medicine cured a very large cancer in my breast 11 inches long, extending to my side and armpit in 14 days over 5 years ago. WRITE AND ASK HER. *Don't doubt, don't delay.*

Mrs. A. L. Bailash, 332 Ohio Street, Vallejo, California, was cured at home of breast cancer; also her mother cured of cancer in both breasts. WRITE TO THEM. E. J. (Lucky) Baldwin, Arcadia, Cal., writes: Dr. Chamley cured a large cancer on my lip and two in my throat after X-Ray and other Doctors had failed. I will give $1000 if I fail to cure any cancer or tumor I treat before it poisons deep. You can't afford to make mistakes with Cancer. Life is surely worth sending your name. 130-page book sent free.

My discovery—a Pacific Island plant extract—has cured thousands of Cancers in from 10 to 20 days, after celebrated physicians and surgeons had declared them "as good as dead."

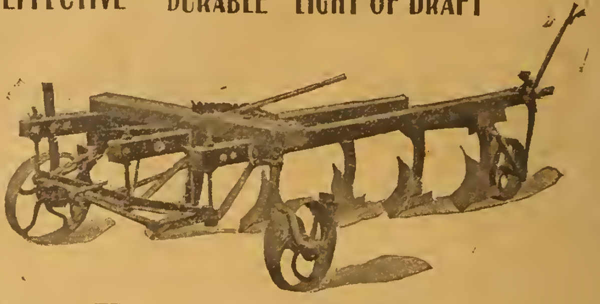
Stockton Reversible Gang Plow
EFFECTIVE DURABLE LIGHT OF DRAFT



This is our regular Plow and Land Shifter and Rear Lever. Land Shifter simple and durable. It is in easy reach of operator and there is no danger of wheel running over foot.

Houser & Haines Mfg. Co.
Stockton, Cal.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pump-head using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

THE FIG OF COMMERCE.

No one thing of recent years is fraught with so much that is full of promise and future greatness to California horticultural wealth as the successful introduction of the genuine Smyrna Fig of commerce, together with the Fig Wasp (Blastophaga grossorum). The culture of the orange is more or less confined to the thermal regions of the State, where biting frosts are unknown, and the thermometer never goes below 22 degrees. With the fig, however, the area adapted to its culture is much wider. It can withstand 18 degrees and not suffer. Hence, its geographical distribution is much wider, and as applied to the Pacific Coast, embraces nearly all portions of this State, the sheltered sections of Arizona and New Mexico, Southwestern Texas, the extreme Southern States, Old Mexico, the Hawaiian Islands, the Philippines and Australia.

Winner New York, 1904, score 97½. Used as a model in the American Standard of Perfection.

Farm at Clearwater on Santa Ana Electric Line

A Few Remarks About the Care of Little Chicks

BY A. A. WHITE

37 White Minorca hens laid over 3,000 eggs during the months of December, January, March, April and May. Eggs sold for fancy prices—37 hens earned $275.00 in five months—fed daily on Coulson's Mash Egg Food. A. A. WHITE.

The problem of how to raise to maturity strong, healthy chickens has been and will be a very vital question to all poultrymen, who wish to make a success. I believe the excessive mortality amongst chicks is one of the greatest reasons why many poultry ranches are not paying double the dividends or profits that they should. Look at the amount of time and feed wasted on poorly hatched and wrongly fed chicks (which, as a natural consequence, die,)that would be more profitably spent on healthy stock.

Yet the solution of this problem is not so hard as it appears. The main thing is to get your chicks hatched right and from stock with lots of vitality. This being granted, now comes the FEED QUESTION, the VITAL QUESTION.

It has been proved beyond a doubt that chicks fed on dry food at least for three or four weeks, have stronger constitutions and are far better developed than soft-food-fed chicks. Why is this? Because the natural food of many fowls is seeds, bugs, etc., for which nature has provided.

WHITE MINORCA ROOSTER
Raised on Coulson's Chick Feed. The Feed is the Making of the Chick.

Now, anyone knows that a hen always raises her brood with better success and also far more healthy than brooder chicks; simply because she forages around and finds them a grain here and another there, so the result is they work and exercise at the same time, resulting in healthy bodies, and good growth.

I have proved to my own satisfaction that Dry Feed is IT every time. My experience dates back to when I used crumbly soft food for little chicks and although I could raise a fair percentage, yet I had better success with dry chick food; particularly the ready mixed feed, which I got from my store-keeper, called COULSON'S SPECIAL DRY CHICK FOOD. The first sack I bought seemed high priced but say, the success I had warranted it, for I found it went further than the other feed, and the chicks grew so fast.

A small batch of chicks, about 200, were fed on Coulson's Special Dry Chick Feed for the first month entirely. I scattered it on chopped straw; etc., and made them eat it up clean, so that I couldn't see any left in the straw at night. After they were a month old I fed them with COULSON'S GROWING CHICK FOOD, which was a more bulky food, and therefore, forced them on growing. They were a fine bunch of Chicks, strong and chirpy, and REMEMBER THIS, no bowel trouble or picking of feet. They were too busy hunting for their food(Coulson's Special Dry Chick Food) in the straw, to have time to stand around looking for feet to pick at, and their crops only taking a seed at a time, were not gorged, but kept grinding away steadily. At eight weeks old I had 197 chicks left out of 200 out of the incubator. How's that for a percentage? Of this number I sold four dozen broilers at eight weeks old for $3.50 per dozen; average weight being One Pound, fourteen ounces and some went over Two Pounds. These were just White Leghorns, not heavy breed chicks.

That convinced me that dry feeding was the solution of how to raise chicks successfully and COULSON'S SPECIAL DRY CHICK FOOD is the feed to do it with economy. My chicks at eight weeks of age had cost me about o cents each, and were fed entirely on COULSON'S SPECIAL.

RAISED ON COULSON'S CHICK FEED.

ADVANTAGES OF COULSON'S READY-MADE CHICK FEED.

A prepared Chick Feed composed of sound selected grains broken to the proper size and blown free from dust is the most economical feed for young chicks. One hundred Pounds will feed as many chicks as Two Hundred Pounds of ground grain.

Why It is Preferable.

The proper feeding of Poultry is without a doubt the most essential factor in the raising of any kind of poultry for profit. Considerable advancement in the feeding of poultry has been made in the past few years especially in the feeding of little chicks.

Chicks should be fed a feed that makes healthy, well developed bodies. COULSON'S SPECIAL DRY CHICK FEED contains the ingredients that are the best adapted to give nourishment to the growing chicks. Sweet, tender seeds, cracked grains, blown free from dust, cut oat meal, tiny pieces of cooked and dried meat, fine particles of fresh cut bone, charcoal, burnt bone, and other good things.

It is a clean, sweet feed that is easily digested, and chicks show an increase in weight, strength and beauty when fed it exclusively. Little chicks need no other food for the first six weeks. You can feed your chicks entirely on COULSON'S SPECIAL DRY CHICK FEED the first six weeks at a cost of about 2 cents apiece.

Ask your feed dealer about Coulson's Special, and be sure that he don't sell you something else. Remember it is COULSON'S that you heard so much about, and make YOUR WILL POWER strong enough to insist on getting Coulson's.

If your dealer don't keep it, write us, and we will tell you where and how to get it.

Keeping a Record of the Milking Cows

By Mrs. Minna E. Sherman, Fresno, Cal.

The farmer rarely keeps books of expenses of the farm, each field, orchard, vineyard, horse stable and cow barn should have their separate accounts. The leaks are nearly always small ones, while the disbursements are large—so often the entire profits leak away in small dribbles.

It is said of an extensive farmer and vineyardist of this neighborhood that his system of bookkeeping is so wide-reaching, that even, when he is in Germany he can check off the expense account and order the horse sold that wears out an undue propor tion of shoes during the year. Now, please do not ask me if I know this is true! I only know what I hear. But it is none the less true that few know where they are losing money, and where they are making it, except in vague way, otherwise the general farmer would be rich in California.

In the dairy the need of culling out the non paying cows is imperative, for they are not only eating but costing money for milking and the wages in California are always high for milkers, for they are scarce enough to command their own terms, that of milking only and of thirty cows mak ing a string even if the thirty only gave a pint of milk apiece. Fortunately, it is an easier matter to cut off the leaks in the dairy than in the general farming, for in sowing a crop there are other matters beside the good seed and general cultivation, matters not under our control for though man may propose well, if God does not dispose the rain to fall in due season the crop is lost.

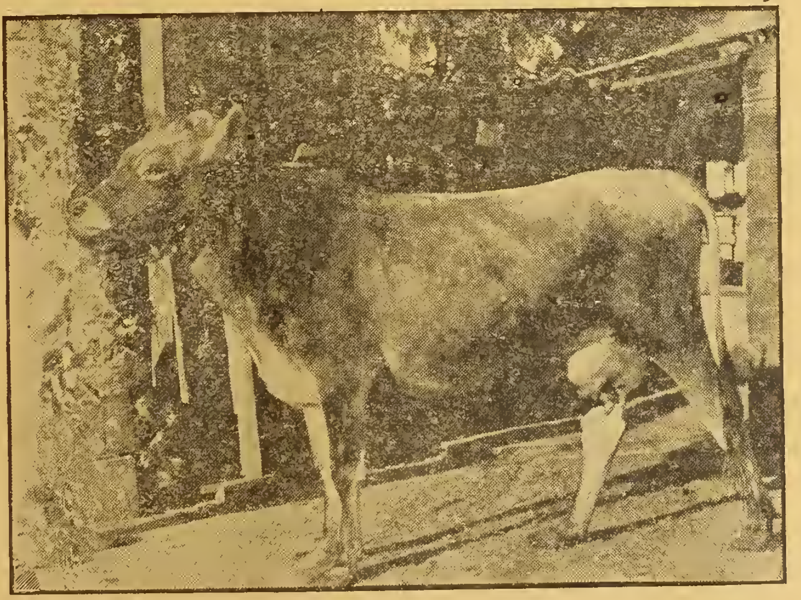
From a herd of full bloods, the culls are not heavy, as the blood is as one and there is not an attempt of Nature to perpetuate an ancestoral propensity that is at variance with the milk quality the dairyman is interested in increasing. The culls during five years averaged six to a hundred in my grade herd after it reached the three hundred pound of butter standard. This is not including the cows that age had rendered useless.

* * *

Sometime ago I spoke of the full blood herd sold in 1901, as having given a profit of over fifty dollars a year per head,. Some of the readers could hardly believe it. Now the present owners of these cows reports that they make a return of $12.00 a month per head from the creamery. Allowing fifty dollars a year for care and maintenance this leaves $94.00 dollars per head. I believe it, for I had thought by 1904 to have had the herd producing $100.00 a year profit, but I was forced to sell them.

The cow records begins with weighing and testing the milk, now, it is hardly necessary to explain the Babcock test to anyone living within a moderate distance of a creamery. The large steam machines are merely labor saving and are not more accurate than the smaller hand machines. Every farm should have a small machine if it is only a two or four bottle one, even when only two or three cows are kept, the children take great interest in the records and it becomes an incentive to them to do accurate and careful work. Taking samples for four days in a month give practically as accurate a test as every day samples.

Those having only one cow can test her readily on the twice a year system. The man at the creamery is usually willing for a consideration to run the milk through when he is testing.



Goldsettie of La Palma, owned by C. W. Leffingwell. The official tester of So. California Jersey Breeders Ass'n. believes she will make one of the greatest milkers of the country

The Vermont Experiment Station has found by comparing a large number of monthly records that if cows that freshen in the spring are tested six weeks after calving and again between the six and a half and seven and a half months the record is practically accurate. For the cow that freshens in the summer the first test is made eight weeks after calving and between six and seven months later on. Cows that freshen in the autumn are tested nine weeks after calving and again at five and a half to seven months afterward. After making the second test the results are added to the first test then divided by two, say at six weeks the cow gave forty-four pounds of milk, testing 3.8 at six months the milk weighed ten pounds and tested 4.8 the time being one hundred and ninety-five days. Adding forty-four to ten gives fifty four, as the amount of milk; dividing it by two gives the milk average of twenty-seven pounds, while adding 3. 8 to 4.8 gives 8.6 the average of which is 4.3 of butter fat, multiply the amount of milk by the butter fat, gives 1.16 hundredths as daily production, this multiply by one hundred and ninety-five days gives two hundred and twenty-six pounds of butter fat. Where only one test is made in the year it is best made at the seventh month. This test will not do to weed out on a herd that are good milk cows but answers well to select cows for a herd to use to breed up; from the scrubs using a registered sire.

Sometimes, in grade cows the productive portion comes early in the milk flow, I had one half Holstein and half Durham that gave the first of her milking as high as ten gallons, or eighty four-pounds of milk daily, making as high as three and a half pounds of butter in a day, but she would run down in milk so at the end of seven months she was dry about four or five months, she easily made three hundred pounds of butter a year. This was a freak made by crossing two well established breeds, after a few experiences that were not so fortunate as this one, but went decidedly to the wrong side of the ledger, I stopped cross breeding and sent the Jerseys and Durham to sires of their own race even, when I had an advanced registered sire of the Holstein at home.

The test at the end of seven months is good for weeding out of native cows for as they freshen they can be sent out to fatten and dried off for the butcher, using those that show enough merit as butter producers to breed up from. It is surprising how many of the native cows will be profitable when handled as the pure bloods are handled, or scrub under thorough-bred conditions take on new productiveness, a few, however, will slide off into beef, these are sold off and the best only are kept until replaced with half breeds. When the first half bred heifers come into milking it is time enough to begin to test them monthly by weighing and sampling the milk, making a composite sample of four days' milk, and the amount of fat produced at the test is multiplied for the monthly amount according to the number of days in the month. The month of twenty-eight days or February is multiplied by seven. The thirty day month is multiplied by 7.50 and the thirtyone day month by 7.75. But this paper is running out too long and I will finish it next week as there are a number of questions to be answered.

INDIGESTION IN THE COW

When I brought my cow in last night she was badly bloated and we were compelled to give her a dose of soda and walk her around to reduce the bloat. She was not inclined to eat. She refused alfalfa hay, but ate her mash and some green oats. She has begun to chew her cud and this evening she ate oat hay and seemed to enjoy it . Her milk has fallen off from four gallons to seven pints. Could such a condition of affairs be due to indigestion alone? Also what rule should be followed in feeding a cow in full milk? Should she be fed as much alfalfa as she will eat, and given a two gallon bucket full of bran mash and some beets in addition? We have been indiscreet, I fear, in feeding our cow. Saturday morning she evidently was suffering from indigestion. I foolishly and ignorantly gave her 14 pounds of beets at one feed. She had not been having them regularly. If you can help us in our difficulty we will appreciate it; also if you will answer this by mail instead of in the Cultivator it will be a great favor. Mrs. M. C.

Indigestion will affect the milk flow at once. You will have learned the necessity of making all changes slowly by the mistake made, but after all it shows a generous heart to feed too much, and when that amount has been gradually led up to the cow will show her appreciation at the pail. The present ration is very narrow and it would be well to feed some rolled barley and cracked corn, one third barley, two thirds corn, or even middlings instead of bran. Alfalfa hay will not hurt the cow and let her feed be increased slowly until she has all she is willing to eat of it; then begin to increase the grain and then find out how much she will pay for at the pail and let her have it. After a cow has had bloating it is well to give her after the symptoms of distress are passed, a pound of glauber salts with two tablespoonful of ginger. Give plenty of water with it to have full cleansing effects.

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

A GOOD PEAR.

Editor Cultivator: Please will you tell me which is the best pear, the P. Barry or the Winter Nellis?—Mrs. M. E. G.

Winter Nelis is the best pear of the two but is a shy bearer in some localities, in fact, is a dead failure, while in other sections it bears well. There may also be districts where P. Barry is a shy bearer, but on the light, sandy soil of the Chino valley it produces well and early; Winter Nelis does not.

SOY AND HORSE BEANS.

Editor Cultivator: Will you kindly tell me through your valuable paper, what is the proper time to plant Soy or Horse beans? Will they furnish a green crop through the dry months for chickens to pick at, if planted on hillside? May they be sown broadcast or is it better to plant them in drills?—W. L. W., Santa Rosa.

Neither of these plants are good for chicken pasture as alfalfa. Both are annuals and are just as hard to start, more easily destroyed by the chickens and not satisfactory. However, an experiment is always a good thing. Plant your soy beans in May after the ground becomes well warmed up as they will not do well in cold ground and will not stand cold weather. Horse beans should be planted early in October so that they will come up with the first rains. The horse bean is a winter growing plant and the soy bean is not.

You will find it difficult to start any kind of a crop if the chickens are allowed to feed on it from the beginning. It is advisable to drill in soy and horse beans as they have large seeds. Alfalfa may be drilled to advantage but your land needs to be in extra fine shape and well firmed. If you broadcast it, roll and harrow with the teeth turned back.

REDWOOD SHAVINGS.

Editor Cultivator: I wish to know in the next issue of your paper whether or not it would be injurious to trees or shrubs, to put Redwood shavings in the ground after they had been used as bedding for stock, also of what value is a piece of bottom land that has a foot of pure sand over it; underneath is very rich soil. I was thinking of dead furrowing it and planting pink beans in bottom of furrows.—J. D., Bostonio.

Redwood shavings whether used for bedding or not will not injure your trees. They will not injure plants; do not know that anything will be injured but we have found in life, that there are exceptions to all sorts of rules, and there are so many things that we don't know that we are not prepared to give an iron-clad rule even about the use of Redwood shavings. We do know, however, that there is no better mulch for using on seed beds where a great many varieties of seeds are to be germinated than Redwood sawdust. We would not hesitate ourselves to use the Redwood shavings.

Your idea of furrowing out and planting the beans in the bottom of the furrows is a good one. Your land seems to be well suited for alfalfa if you can get a good crop of weeds to grow and sow the seed broadcast in the fall. The weeds will mulch the ground and protect the young alfalfa from the frost till the roots get into the good soil.

(Redwood or pine shavings and sawdust, even though fresh from the mill will not injure any plant life, whether used as a mulch or mixed with the soil. The most tender seeds have been started and grown in Redwood sawdust and shavings. Ed.)

GRAFTING DECIDUOUS TREES.

It is now time that all scions for grafting should be cut and put down in damp (not wet) sand in a cool place. The term 'cured buds" is applied to those which have ben cut and put down in sand or some material which prevents them from drying or becoming moist but retaining the same condition as when cut from the tree. When such buds or scions are placed in a tree that is just beginning to grow, the proper period for grafting, they will take the sap from the tree just as a dry brick will take water from a wet sponge, except that it is an osmotic action. For this reason, cured buds are the best. A bud or scion commences to take sap as soon as it is joined to the stock unless the union is imperfect or the scion contains the most sap, in either case of which there will be a failure.

The best time to graft is when the buds just begin to open, though it may be done after the new growth is one to two or three inches long on apples and pears. Apricots are not successfully grafted on large branches but are best worked by sawing off the tops and budding the sprouts that grow.

It is best to graft the whole top of the tree at one operation than to graft part one year and the balance the next. This plan is sometimes followed and the result is always an uneven or an unbalanced top. Side branches that project to one side should be trimmed off close and the trunk and main branches whitewashed to prevent sunburn. Should there be a very rank growth that would endanger the grafts by being blown out, top them as to retard the growth and stiffen the wood.

Limbs two or more inches in diameter should receive from two to four scions each, and when they have about capped the sawed end of the stump, they should be thinned so as not to crowd. Usually one will take the lead and be sufficient top for one stump, but the purpose of the other is to cap the stump with new bark before decay begins.

Any method of grafting will succeed when the stock and scion are in proper condition, the inner barks match and the work is quickly done. The materials may be in first class condition and the workmanship perfect, but if not quickly done and the uniting allowed to become a little dry, the work will become lost. For this reason bark grafting is usually very successful as the bark is lifted and the scion inserted simultaneously.

Bark grafting is the most rapid method, being very satisfactorily done by the use of a large nail, No. 14 is a good size. File it off so that it will have one flat side, but at an angle. Insert this at the top of the stump between the wood and bark, nearly as deep as the scion is to go; remove the nail and insert in its place a scion which has previously been trimmed and press it down firmly. Make a ring of these around the stump, paint with wax, wrap with coarse twine and wax again.

The saw graft which consists of sawing down the side of the stump and into the top, then cutting out the incision with a sharp knife, is a good method. The groove is made larger at the top so that when the scion is made to fit, it may be pushed down from the top so that it is snug. Wrap and wax as described. The cleft graft is not desirable in large branches as it splits the limbs and promotes rapid decay. All cuts should be coated over with wax.

Practical Farm Science

TABLE GRAPES

My experience in raising table grapes for the past fifteen years in California has been in the Coast section of this county, so these points will apply to similar sections in this part of the State. The first and most important thing about raising a table grape that will be both meat and drink is in the selection of suitable soil. I have talked with people who thought they were growing good grapes on damp sandy land. But large clusters of pale, sour berries are not table grapes, so choose a warm upland with rather a heavy subsoil and you will have both color and sweetness

* * *

Cuttings—Taking it for granted that you have your ground plowed early in the season and well pulverized—select good cuttings from a healthy vineyard making them 12 to 14 inches long. Plant them in vineyard form where you wish them to grow. I prefer a cutting to a rooted vine for the following reasons. In planting a rooted vine you necessarily must cut off almost the entire root system and the vine will be from one to two years in recovering from the stroke, whereas a cutting planted in vineyard form the roots remain undisturbed and at the end of two seasons you will have found that the rootlets have covered the entire square allotted to each plant. Then with rather severe pruning the first few years of its life until the stock has become stiff and upright, you will have laid the foundation of a vineyard that will be bearing fruit in generations to come.

* * *

Planting—February and March (first half) are the best months. Procure common baling wire and cut and recouple it in lengths that you want to set the vines apart and then stretch tightly across the field keeping the end stakes always in line and plant a cutting at each coupling in the wire. I use a shovel in digging the holes and set plants seven or eight inches deep. In very sandy soil one could set much deeper with good results, but on good grape land deep planting puts the cuttings where the soil remains too cold, and if it starts at all a few sickly roots will come near the surface, whereas you want strong roots to come out at the bottom of the cutting. I have a friend who ruined a 30-acre setting last year by deep planting, whereas a few reserves that he stuck in shallow on the same ground made large growth.

* * *

Cultivation.—Keep the ground well stirred and free from weeds and plant no other crop between the rows. With such treatment and the moisture of the ordinary winter rains you should get 95 per cent of a stand. Do not irrigate unless you are obliged to do so on account of no rain. The best table grapes are raised without irrigation.—G. D. Less.

THE MULBERRY IN CHINA

The lunsang or domestic mulberry is cultivated in China in preference to all others for the silkworm. Most mulberry plantations are begun with the wild plant, to which the domestic is grafted. The spot chosen is high and level, if possible, and should be rich. A wet soil is injurious to the roots. The trees should planted 6 or 7 feet apart in holes 1 1-2 to 3 feet in diameter, wherein liquid manure has been placed. This, after the roots have had the earth sifted and tightly packed around them, obviates the need of daily watering. In February the shoots are cut down to within 1 1-2 feet of the ground. Then two sprouts are allowed to grow which by October, ill be some 5 or 6 feet high. In February of the third year the upper parts are pruned to about 1 1-2 feet above the original stem. Again on each branch only two sprouts are allowed to grow, which by October will be some 5 or 6 feet high. These are pruned at the same time, February, and at the same length as the others. This process is continued for five years, after which they are allowed to grow without pruning until May or June, when both stems and leaves are cut off, and are called the first crop of mulberry for feeding. If all the leaves are not consumed they should be cut off, or else the next year's growth will be thin and small. Subsequently two sprouts only are permitted to grow on each uppermost branch all sprouts below and on the trunk being rubbed off, so that in the Fall there will be in all 16 branches to supply the next year's crop. The full grown tree is about 5 feet high, so that it can be easily cultivated and leaves gathered by any ordinary-sized person. The longest-lived trees are said to last over 50 years. One tree will produce from 75 to 100 pounds of leaves.—Consul Haynes of Nanking in Consular Report.

ADULTERATED FERTILIZERS.

Nitrate of soda which is used to a considerable degree by the market gardeners and florists is often adulterated to a serious degree at the present time. For this reason it is advisable for every one to exercise special care and purchase only from trustworthy dealers. The more common adulterants are common salt and salt cake from the manufacture of acids. Both are worthless as fertilizers and in themselves contain no plant food. The nitrate is shipped direct from Chili and was formerly sent in 310 pound bags which are very clumsy. It is now shipped in 200 pound bags, and it is preferable to purchase nitrate in the original bags.

"Salt cake residue made as a by-product in the manufacture of nitric acid is also used at times to adulterate nitrate of soda, and in some cases has been sold as such. It is frequently called niter cake which name gives it a false value from the gardener's standpoint."

TREES

True to Name

It is of the utmost importance that young trees, shrubs and vines for planting be true to name. They must also be well rooted and properly prepared for shipping and planting.

We have four separate nurseries, comprising over eleven hundred acres, in different sections of the country, each having its peculiar soil best suited to the special requirements of different trees, shrubs and vines for their perfect development. It is a costly method for us to pursue, but it enables us to grow the very best on the market.

CALIMYRNA FIGS

Over fourteen years of careful experimenting with the growth of the Smyrna fig, or fig of commence, in this country were required before we could say that we had been entirely successful in propagating this valuable fig, and for the past five years we have been growing this fig in its perfection, drying, packing and marketing it.

There are several varieties of the Smyrna fig, but with our varied experience in this line we feel warranted in recommending one, the Calimyrna, as the most profitable and best for all commercial purposes. We are able to supply almost any desired quantity of these superior trees.

We protect the Calimyrna Fig with the seal shown herewith, which is attached to each bundle of ten trees.

We have this season a superior stock of

PEACHES, PLUMS,
PRUNES, PEARS,
APPLES, APRICOTS,
CHERRIES, OLIVES,
NECTARINES, ETC.

These trees are all grown in our nursery plant, No. 3, which has a rich river bottom soil, permitting the most perfect rooting. Our

ORANGES,
LEMONS,
POMELOS,
LIMES,
CITRON

And all of our citrus fruit trees are grown in our nursery at Exeter, which has a deep, rich, black loam and is particularly suited to citrus trees. All of the standard varieties will be found in our stock.

GRAPE VINES

As we are the largest growers on the coast of the best varieties of raisin, wine and table grapes and also make a specialty of vines grafted on phylloxera resistant roots, we are in a position to fill your orders most satisfactorily.

CATALOGUE FREE

Our catalogue, in either English or Spanish, is profusely illustrated and gives a good idea of the immensity of our stock. We mail it free to any address on receipt of 6c postage. Price list mailed on application.

BOOK YOUR ORDERS NOW

If you are contemplating doing any planting it would be well for you to place your order as early as possible. We will book your order now and ship your stock when it is desired.

Paid-Up Capital, $200,000.00.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

A FAVORABLE FRUIT SEASON

Prospects for a deciduous fruit crop in the northern counties still continue favorable. There has now been ample rainfall to insure a good season, and it has come at the most opportune time, while continued cold weather early in the season prevented the fruit trees from too early blooming. Almond trees which often bloom early in January did not put out this season until along in February; apricots and peaches are now following and all are later than usual. This gives hope of greater immunity from spring frosts which so often catch the early bloom or the young fruit. It is said that "You should not whistle till you are out of the woods," and we are not yet through the winter season, but for all that we have so far had a very propitious season; all deciduous trees here are well loaded with fruit buds and at present time it looks as though we should have a bumper crop of these fruits.

* * *

TO IMPROVE THE STATE FAIR

The new management of the State Agricultural Society is taking every means to lift the State Fair out of the slough into which is has fallen and to make it really and truly a representative exposition of the agricultural and horticultural industries of the State. To this end the State Horticultural Commission has been asked to co-operate, and all the County Horticultural Commissioners will be asked to lend their aid, in order that the fruit display at the next state fair may be truly representative of the whole state. It is hoped to have the finest display of fruit and fruit products on that occasion ever got together and to show not only visitors but our own people, what California can produce. Mr. Al Lindley the Secretary, by the way, is a Los Angeles man, and this should be sufficient assurance that he knows how to do things as they should be done, and while horse races will still be an important feature, they will not as heretofore predominate over all other features, nor be made the most important.

* * *

CLOVERDALE CITRUS FAIR

Cloverdale, Sonoma County, has just finished its Fourteenth annual citrus fair, and it has been a highly successful one. These fairs have increased in interest from the commencement, and it was found necessary this year to very greatly enlarge the pavillion in which they are held in order to accommodate the exhibits, while the attendance has been unusually large. While some really fine citrus fruits are grown in the vicinity of Cloverdale, enough at any rate to show, it is not likely that this will ever become an orange growing district. The enterprise of the people here, however, is deserving of commendation, and if these annual citrus fairs do nothing more for Cloverdale they cause her to be talked about while without them no one would ever hear of her.

SHORTAGE OF CODLING MOTH WORMS

The Horticultural Commission, or at least that branch of it having charge of the breeding of beneficial insects, is having a great deal of trouble in getting sufficient codling moth worms to breed the parasite of that pest on. It would seem as though with the abundance of this pest in the apple ripening season, that there should be no difficulty in getting all the worms required to feed the parasites in unlimited quantities, yet despite frequent and frantic appeals to the apple-growers and the apple sections, not enough have been secured to keep the stock up to the required standard, and as a consequence the parasites have not bred out in such quantities as they otherwise would have done. Apple growers should communicate with the San Francisco branch of the Horticultural Commission, and if they can supply worms or put that office in the way of getting them they should do so in their own interest and that of the State.

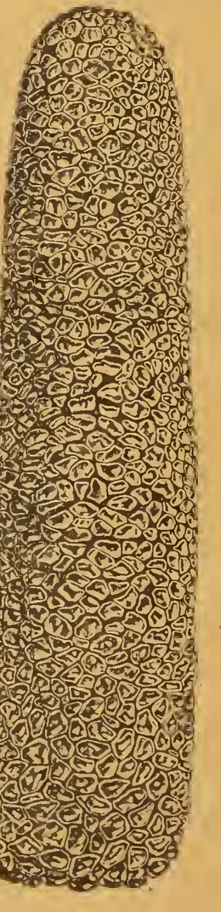
Seed Corn

We have just received our carload of Seed Corn from our Nebraska grower, consisting of the following named varieties:



Country Gentlemen

Field Corn

King of the Earliest / **Pride of the North** Very popular here on account of earliness.

Reid's Yellow Dent. The universal prize-winner.

Improved Leaming / **Early Mastedon** well-known favorites because of large yield.

Sanford White Flint is a White King Philip.

Minnesota King is a Yellow Hickory King.

White Cap Yellow Dent / **Red Cob Ensilage** Best for ensilage.

Wisconsin White Dent / **Champion White Pearl** / **Iowa Silver Mine** the best varieties for large white corn.

Sweet Corn

Oregon Evergreen. The earliest large Sweet Corn, and the best market gardener's money maker that grows.

White Evergreen
Stowell's Evergreen
Country Gentlemen
Early Minnesota
Early Crosby
Early Mammoth

All well known.

Black Mexican. The sweetest Sweet Corn of all.

Write for prices in quantity. All Sweet Corn **10c per lb.**, postage 10c extra.

Call and select your Seed Corn.

Reid's Yellow Dent

MUSK MELONS

The Sandoval Pineapple
[See Cut]

Is the greatest money maker for the market gardener. For two years the large, early Muskmelons brought to the market by Mr. Sandoval have been the envy of all the other growers. Its oval shape, heavy netting and excellent flavor recommends it to the consumer and to the shipper. Because of its ready sale all growers will want some seed of this variety.

The J. & M. Ideal

Is the best muskmelon for the family garden.

With the Citrus Growers

BY J. W. MILLS

TRANSPLANTING OLD ORANGE TREES.

We have had inquiries from persons who wanted to move some old orange trees from one lot to another but were afraid of losing the trees.

There is not much danger of this, as the orange tree is one of the most persistent trees to grow that we know of. It has a grip on life that rivals the proverbial cat. With care that the roots do not become dry and a good supply of fertilizer, preferably stable manure, placed a foot or two beyond the severed roots at the time of transplanting and there is little danger of losing the tree. It is best to move a ball of earth with the tree. Wet the soil around the tree before moving to make the dirt stick and allow the tree and soil to become slightly dry before watering, then keep it evenly but not excessively wet By allowing the tree to become slightly dry, it will take up the water more rapidly than if kept saturated all the time. It is advisable to remove part of the top, but it is not necessary to cut off enough to disfigure the tree. Cut to some lateral that assumes the general direction desired and do not cut so as to leave a stub.

TREATMENT FOR LARGE SEEDLINGS THAT CROWD.

Most of the old seedling orange groves that remain today, were planted when sixteen to twenty feet was thought to be the proper distance apart for the trees. Crowding has forced the growth up and the trees are in such cases, bearing the most of the fruit on the tops. The side branches being crowded, shuts out the light and prevents their bearing. The only thing left is to thin out the trees or cut them back. We have seen crowded seedlings produce good crops for awhile by making liberal applications of stable manure, but grafting over all or part to other varieties [illegible] most cases been resorted to. Good results have been obtained by budding over half of the trees to Washington Navels or Valencias. By budding every other diagonal row, there will be a seedling with a budded tree on four sides of it, thus giving it room for light which means more fruit. By this method the remaining seedling trees will have a chance to develop strong healthy growth on all sides and that will mean better bearing qualities. In two or three years the budded trees will be producing paying crops.

When it is desired to re-invigorate the growth of old seedlings that have come to a standstill, a severe cutting back of the entire top to such an extent that it will have to form a new one. will without doubt give it the best and quickest returns. When it is known that cutting back to a mere stump and inserting an artificial top will give a healthy and vigorous top in one or two years, it is reasonable that if the same style of pruning is done and the suckers left to form the top, a new top will be produced in less time than a budded top will give.

See page 32, Bulletin 138, of the Agricultural Department of the State University.

THE HARDY ORANGE.

For the last three or four years all readers of horticulture journals have frequently met with articles under the above caption. I find such an article in the Cultivator of February 23rd, accredited to "Prof. B. T. Galloway, in Youth's Companion." The reports on and about this or these hybrid oranges have become a sort of bugaboo to many timid souls engaged in citrus culture. In the production of a hardy orange, in commercial quantities, they see destructive competition with the present varieties of citrus fruits that will render our groves profitless. Perhaps a few points of information as to the actual status of this hybrid orange as I saw it on its experimental grounds in Florida, a little over a year ago may quiet unnecesary fears in regard to this fruit.

I saw, handled and tasted these varieties for there seemed to be much variation among the fruits of the many trees on the five or more acres which comprised the experimental grove. From my own observation and the judgment of a very wise and experienced nurseryman and grower of citrus fruits, I believe it will be many a year before there will be any marketable fruit in commercial quantity, from the normal development of any of the species or varieties, which I saw on the trees at Glen St. Mary. There were wide variations in the trees themselves, with the single exception of being exceedingly thorny. Citrus growers in Florida years ago found an insuperable objection to the King orange because of the many and large thorns which ruined so much of the fruit, and made gathering a hardship. The King trees are not a circumstance to the multiplied thorns of the hybrids I saw. The fruit had wide variations in size, color and texture of skin. The sizes ran from those of navels to those of small Tangerines—the latter being in the minority. The colors ranged from light lemon to red orange. The skin was in most cases decidedly coarse and even rugose. The flavor was a combination of an indescribable sharp, sour, commingled with the bitterness of an unripe grape frut crossed with unadulterated sulphate of quinine. I think they would make a good "ade" if one were wealthly enough to buy the amount of sugar necessary to make the "ade" palatable. I am satisfied it will be many a day before "ade" made from such hybrid citrus fruits as I tasted will become "a habit." It may be that some genius will develop an edible orange that can be grown in the north temperate zone, but I cannot see any immediate prospect of such a fruit developing from the present status of the citrus hybrids as I saw them except after countless experiments extending over a long interval of time. Whatever will result will be developed, per gradum and even so, the resultant fruit, in all probability will not be a fruit that in any wise can supplant our present delicious oranges, and that royal fruit, the pomelo. Florida citrus culturists have been hoping to obtain a seedless tangerine. The process of evolving a seedless variety from those citrus hybrids, which I sectioned, will be a tedious one, if their abundance of seeds is any indication. I never saw a mandarin or tangerine so packed with seeds as were those hybrids of the Citrus trifoliata and Çitrus Aurantium. The citrus growers of California have no danger to their prosperous industry threatening them from any "hardy orange" which I have seen, or of which I have heard.—C. J. K. Jones.

ORANGE TREES
Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County

Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.

E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Angeles, Cal.

Orange Seed Bed Stock

I have some 50,000 fine seed bed stock for sale. These plants are good color and very thrifty. Absolutely clean and healthy in every way. I will make them caliper 3-16 of an inch and up to ⅜ or ½ inch. Owing to the large size of the plants the packing will necessarily bring the price above the ordinary price of common sized plants, but they will be sold cheap, and if you intend setting it will pay you to see this stock.

J. M. Baker - - - Glendora, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

NAMING TREES

The increased interest in forests and forest trees which is a sign of the times has, among other things, led many city and town officials to seek to make known the names of trees growing in streets and parks. Not only are such trees in very many cases without marks of identification, but in not a few cases they have been labeled with incorrect names. The Forest Service has devised plans by which its co-operation may be secured in correctly identifying the public trees of any community which may care to call upon it.

It is remarkable how little uniformity there is in the use of tree names. Even scientific names, which are, of course, always more exact than the common names, are in many cases unsettled, but common names are often used almost at random. In different parts of the country the same species may be popularly known under very different names, and on the other hand, the same name is often used in different localities for altogether different trees.

In the effort to assist toward uniformity of usage in scientific names of forest trees, and also lessen the chaos in the use of common names, the Forest Service has already published "A Check List of the Forest Trees of the United States." This serves as a guide when once a tree has been identified by the botanist. But the first requisite is that the identification should be correct. It is here that difficulty is often met with. For this reason the Forest Service now offers its technical knowledge to city authorities.

There are two ways in which assistance may be given. Where the work is on a large scale, a representative of the Service will visit the town or city and identify the tree by examination on the spot. In most cases, however, identification by correspondence will prove entirely adequate. This will require merely that specimens of the trees be sent to the Forest Service, together with a rough sample plat showing their location, the plat and specimen being numbered to correspond.

For such identification a full set of specimens, illustrating mature foliage, and, if possible, specimens of the flowers and of the fruit (as the botanist calls the seeds) should be sent. Fruit specimens are very essential, but flowers may be omitted if they cannot be readily secured. Two or three specimens of branches in leaf, 10 to 12 inches long, taken from different parts of the crown, so as to exhibit all of the leaf forms common to the species, will answer for the foliage. One or two specimens of the foliage, flowers and fruit may be placed between sheets of ordinary newspaper or blotting paper about 12 by 16 inches in size. Thirty to fifty specimens and sheets may thus be piled one on top of another, and the whole bundle placed between two stiff pieces of mill board, pasteboard, or thin picture backing, a little larger than the sheets of paper carrying the specimens. The package must then be well tied and wrapped, when it may be sent by mail if under 4 pounds in weight. If before sending, the specimens are changed to dry sheets of paper once in twenty-four hours, keeping them constantly under a weight of from 40 to 50 pounds, they can be thoroughly dried within two or three weeks, when they will not be so heavy and will still be in excellent condition for identification.

Suggestions as to labels and their use are also made by the Service when requested. ,

While the Cultivator is only too pleased to reprint the above government press bulletin, we wish to impress our readers with the fact that we are willing and anxious to serve our readers in the same capacity in regard to California grown plants. Send in material as noted above except that it may be bundled in to us "in any old shape," and we will identify your trees.

THE LOMBARDY POPLAR

Trees of very unusual or striking character, as the Lombardy and Bolle poplars, must, likewise, be used with the greatetst caution, and, above all, their formality and strangeness should not be enforced by planting them in rows, in rural places.

The poplars are examples of trees which should be used only for secondary or incidental effects in landscape gardening, and never to construct the body or main features of the planting. Cheap trees produce cheap effects.

The Lombardy poplar may be used to advantage now and then in a group of trees to add spirit and vigor; but it should rarely be seen as an isolated specimen. The tree is used indiscriminately, because it grows rapidly in all situations and because its oddity pleases many people. It is so much abused that its legitimate value is obscured.

But the tree can oftetn be used to good effect as one factor in a group of trees, where its spire-like shape, towering above the surrounding foliage, may lend a spirited charm to the landscape. It combines well in such groups if it stands in visual nearness to chimneys or other tall formal objects. Then it gives a sort of architectual finish and spirit to a group of trees; but the effect is generally lessened if not altogether spoiled, if more than one Lombardy is in view. One or two specimens may often be used to give vigor to heavy plantations about low buildings, and the effect is generally best if they are seen beyond or at the rear of the building.

PLANTS HAVE EVERY SENSE BUT HEARING.

Dr. Henry S. Conrad of the botanical department of the Johns Hopkins University, while he does not accept in toto the theory of Dr. G. Haberlandt of the University of Gantz that in the stems of plants and in the leaves there are organs that resemble the eyes of animals and that through these, plants perceive the light, is convinced that in some form plants have all the senses of animals except that of hearing. He says: "We have never been able to discover any way in which they are susceptible to sound but in seeing, feeling and tasting they are developed." Dr. Conrad has been for some time making studies in this line. In one laboratory work was being done upon the power of plants to see. There were placed in a window a number of plants of the bean family. Those plants which were in the glare of the sun had the edges of the leaves turned upward toward the sun, so as to escape too great an amount of sunlight. Those that were in the shade had their leaves turned back close to the stem.

CIVIC UGLINESS

One of the things that the people of our large cities need to have impressed upon them is that beauty is an asset and that ugliness is a liability, and that the movement in behalf of municipal improvement that is making such headway in various parts of the country has back of it something more than an aesthetic impulse. It is based upon a recognition of the fact that the people are entitled to beautiful and wholesome surroundings as a right and not as a privilege, and that no more beneficial investment of public resources can be made than to build a city where beauty shall be the common heritage of all who dwell therein.

In the Vegetable Garden

BY ERNEST BRAUNTON

FORCING RHUBARB.

A paper entitled "Forcing Rhubarb in the Dark." was presented by W. R. Lazenby. Rhubarb roots grown from seed planted early in the spring are pulled out the following fall and allowed to freeze. The roots are then put in beds in the cellar and covered from two to three inches deep with dirt and kept in total darkness. With a temperature of 70 degrees, F., marketing the crop can begin within 20 days and cuttings can be made in about four weeks. At a temperature of 55 degrees, about 30 days are required before the first cutting can be made. Drying the roots was found to have about the same effect as freezing. Either drying or freezing serves the same purpose as a long rest, which is otherwise required, and the growth is more vigorous. When thus grown in darkness the leaf blade is greatly reduced; the green color is wholly absent; the texture is more crisp and delicate, due to a lessened development of woody fiber; the skin is much thinner than when grown in light; the water content is increased six to ten per cent.; and the flavor generally improved. The first two or three cuttings give the finest stalks. Two crops can be grown in the same space during the winter. By double cropping $35.55 worth of stalks was sold from an area of 185 square feet.—American Florist.

ONION CULTURE.

There are many people who fail to secure good results in onion culture, because they do not give the proper attention to the land before planting. There is no crop for which there needs to be made more careful preparation than the onion. The natural home of the onion is a loamy soil, with a plentiful supply of humus, and therefore, retentive of moisture. The beaver-dam soils of Oregon, and the black loams of California, are nearly ideal soils for this crop. After these soils have been devoted to the growing of this crop for a number of years, they are hardly ever sufficiently well supplied with potash and phosphoric acid, the mineral plant foods, although they have an excess of organic matter. With a more liberal supply of the mineral foods than nature furnishes in these soils, the crop is usually very materially increased. The crop is generally a very profitable one to those who rationally combine their peculiar soil condition with the application of mineral plant foods. One of the best combinations for this crop is muriate of potash, 400 lbs., dissolved bone, 500 lbs., fine ground bone, or Thomas slag, 100 lbs. This fertilizer should be well mixed with loam to secure an even distribution, and applied evenly over the land. Stable manure is not generally looked upon with favor by onion growers, because it introduces to the land such a variety of weed seeds, and further, it is assentially a nitrogenous fertilizer, while the mineral fertilizers are the ones generally required upon these dark soils. Whatever the fertilizer applied, the onion grower must keep in mind the old adage that "tillage is manure." During dry seasons, at least one inch of loose soil should be on the ground as a mulch to conserve the moisture and a mulch of three inches is far preferable.

While the dark soils as indicated are the most sought out for onion growing, often success is had upon some of the lighter colored rich soils. On these soils, however, the application of nitrate of soda at the rate of 50 lbs. per acre should be sown broadcast at the time the sets are placed, and the application repeated two or three times during the growing season. The other material, phosphoric acid and potash, should be applied when the soil is prepared, and should be well worked into the soil.

When the onions fail to produce satisfactorily, it is a good plan to seed the area to some leguminous crop, and supplement it with the mineral foods, potash and phosphoric acid, in order to increase the nitrogen of the soil upon which the crop draws quite heavily. This practice is preferable to the constant use of nitrate of soda to secure the nitrogen, because the nitrogen is supplied to the soil at a less cost, and at the same time the soil is kept in better physical condition.—Geo. Wright.

VALUE OF THE GARDEN.

Farmers can never have ideal homes without the fruit garden. It teaches the lesson of intensified farming and results in better tillage, larger crops, better stock and improved methods in every way. Good gardens and poor farms never kept company long. The growing of berries for family use is easily done. The growing of berries on a large scale and selling them requires considerable skill and a special business tact. Only those who have good location, good market and a taste for the business should attempt it. Many small farmers so situated are making a success by commencing moderately and increasing acreage from season to season as experience warrants. Berries should be grown by owners of all village homes and acreage property in city and village may be profitably used for that purpose. The market gardener selling his own products can often make an acre or two in berries very profitable.

AGRICULTURE IN SCHOOLS.

In our efforts to teach agriculture in the schools teachers will choose the wise course by selecting certain grand divisions of the subject for discussion and school study this season to the practical exclusion all others. Field crops is a topic which calls aloud to some teachers and may best be first taught by those who feel an especial interest in this topic. To other teachers fruits may appeal with such peculiar force as to make this the most convenient point to begin in taking up a new line of school thought. The soil, birds and wild animals, our domestic cattle, or farm poultry and bees afford each in its turn most excellent beginning points. Let not the teacher be deluded into the scatteration method of teaching "all about agriculture" in one year.

TREELESS FARMS.

There are too many farms without the beautifying and sheltering influence of a grove more or less extended. Go to the farm where trees exist and compare comfort there with a treeless homestead and there will be no doubt as to the form of resolution the contrast will inspire.

GARDEN PLANS.

Plan for the garden now; order your seed from some good reliable seedsman, and do it now while you have time to think about it. Don't put it off until spring opens and your spring work is all on in a pile, and you haven't time to give a moment's thought to your garden. and don't forget to include at least a few packages of flowers.

RECLAMATION BY IRRIGATION

Vast tracts of arid land that were formerly considered valueless may be so reclaimed by irrigation that they become veritable garden spots of great fertility. As the population of the country increases, and available agricultural lands are taken up for settlement and improvement, the problem of irrigation steadily gains in importance.

First Woman Suffragist—Did you cut the ticket or vote it straight?

Second Woman Suffragist (absently)—Straight! I cut it on the bias.—New York Press.

WATERMELON SEED
I still have about forty pounds left of that extra Chilian melon seed, grown and selected by myself, which I will sell for 75c per pound by mail, 60c pound for 5 pounds or over by express.
Address **S. Fairburn, Burbank, Cal.**

STRAWBERRY PLANTS
(TROPICO BEAUTY)
The very best Brandywine stock at low prices for sale by the grower,
D. Griswold, Box 25, Tropico, Cal.

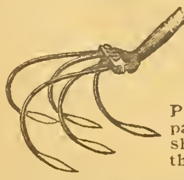
Cuthbert Raspberry Plants
$1 per 100, $6 per 1000
Gray's Gardena Dewberry
$1.25 per 100, $8 per 1000
A. E. Nelson, El Monte, Cal.

IMPROVED GARDENA DEWBERRY
And all other kinds of Berry Plants, Nursery Stock for sale.
A. R. Rideout, Magnolia Nursery, Whittier, Cal.

BRANDYWINE PLANTS
Brandywine Strawberry Plants for sale, Kellogg's strain. No better nor thriftier plants grown. Clean of all disease; at bottom prices.
G. W. MULLENDORE, COVINA, CAL.

CrimuosWinter Rhubarb
Small plants from seed bed, $2.50 per 100, free by mail. (Not less than 50 sold.)
Box 168, Redondo, Cal.

Seedless Blackberry
The main crop has no seeds. Very early, extra large and very prolific.
Geo. W. Peck, 670 Horton Ave., San Diego, Cal.



ADJUSTABLE GARDEN CULTIVATOR
Price $1.50. Sent charges paid on receipt of price for short time only, to introduce them.
Ira D. Brown, Dist. Agt., San Fernando, Cal.

A Big Seed Offer
Convincing Seed Buyers of the Quality of : : :
Taylor's Seeds
Try Seeds First, Then Send Money

In order to introduce our seeds as rapidly as possible we will, upon request, send one each of our specially arranged collections of choice vegetable and flower seeds. The quantities are proportioned and selected to give a continuous supply of flowers and vegetables of high quality throughout the season to those who do not care to wade through long catalog lists. So certain are we that they will give satisfaction, that we will send our collection of flowers, 14 varieties, and our vegetable list, 14 sorts, for $1.00, and wait for our pay until you have tested the seeds and proven to your own satisfaction that they will germinate and produce the results we claim. If they are not first-class you do not send us a cent, if they "make good" June 1, send the dollar.

You know we could not do business on such liberal terms if our seeds were not as represented. They are guaranteed true to name and the seed grown. Remember, we require no money in advance. Order today, using coupon below, and you will say it was one of the most profitable dollars you ever spent.

F. Gilman Taylor Seed Co.
Box 27, Glendale, Cal.

Please send me prepaid one each of your vegetable flower collection. If they grow satisfactorily, I will pay you $1.00 on June 1st, 1906. If not satisfactory, it is understood that I am to be at no expense whatever.
[Write plainly.]

Arbor Day Celebrations—The Cultivator is glad to read the numerous notices of Arbor Day doings throughout the state. They speak more than words or pen of the growing interest the occasion is creating in the minds of our people. At Oxnard, for example, a carload of street trees was distributed and set out on the streets. At various other points tree planting was engaged in with appropriate holiday exercises of the George Washington character. This is encouraging. The Cultivator has for years advocated the necessity of planting shade and ornamental trees on the streets and on public grounds, like school, church and courthouse grounds, not only for the beauty they create, but the moisture they conserve.

The more trees we plant in California the more rain fall we shall get., and the greater the rain fall the less we shall be compelled to irrigate. So the question of tree-planting becomes an economic one after all, for if by beautifying our streets we at the same time add to our water supply we have added to our property value and gained in pocket by conserving moisture and the expense of irrigating.

Why don't individuals, municipalities and corporations make Arbor Day a time for wholesale street and country ornamentation? They are doing this in the middle states and they are making money thereby. George Washington would a great deal rather have a million or two shade trees planted on his birthday with a thought for him as the last shovelful is thrown about the roots of the tree than to have banquets given in his honor where wine makes fools of men, and they in turn make a fool of the father of his country by the maudlin praise they bestow upon his memory. Chambers of Commerce and Boards of Trade all over this state would really do something commendable if they would spend the money they eat and drink at Washington's birthday banquets, in purchasing trees for parks and streets and have them planted right so they will grow and become useful ornaments to the country. Towns like Los Angeles and San Francisco ought to set the smaller towns an example in this particular, instead of the towns being the promoters of the pleasant and attractive project and giving these cities pointers on how best to celebrate the 22nd of February. The Cultivator hopes next year that every local improvement club through out the state, no matter what its name is, will make it a point to have some public exercise of an appropriate nature on Washington's Birthday and with it plant a few hundred ornamental trees on the streets and on the school grounds. Here is work of practical worth for the State Promotion Committee to give attention.

* * *

Orange Case Reversed—The orange growers have sustained a serious reverse at the hands of the Supreme Court of the United States, which on the 24th handed down an opinion reversing the decision of the Circuit Court of the United States for the Southern District of California in the Citrus fruit case, appealed by the railroads of this State against the Interstate Commerce Commission. The points before the Court were the right of shippers to route their fruit over lines independently of the railway companies, and as we remember, also, asking that the rate of $1.25 per 100 lbs be reduced, the same being decreed exorbitant.

The decision denies the shippers the right to route their own consignments and permits the railroad companies to route the same as they please.

In the text of the opinion as reported the court supports the contentions of the railway companies that no harm could come to shippers of fruit should the companies be permitted to select the routes over which the eastern shipments were made after crossing the Missouri River.

The court is of the opinion that no time is lost, and the strong opinion is also expressed that should the initial carrier be permitted to do the through routing, rebates will be entirely done away with, as under those circumstances shippers could in no way receive rebates, not knowing over which eastern road the fruit is to be routed.

No mention is made in the opinion in reference to the rate of $1.25 per 100 lbs on fruit destined to points east of the Missouri River, which the shippers claim, is exorbitant, on the grounds that the railway companies are in better position to give lower rates, and also that the price of fruit has greatly decreased.

The outcome of this decision is greatly feared by the fruit growers of this State who contend that it will result in a return to the conditions which obtained previous to the decree of Judge Wellborn entered about three years ago. At that time the slow service and indifferent handling of fruit wrought vast damage to growers. Fruit delayed in transit rotted in the cars, some of it was even frozen before it reached its destination. Under the decision rendered it is claimed fruit men are at the mercy of the railroads, in every particular and this of itself is feared will result in the demoralization of the citrus industry in this State.

What the result will actually be, however, depends on the anxiety of the transportation companies for the business. If they wish to encourage citrus shipments they can do so, by giving growers quick service and by following the rule of sending to markets which desire them the kind of fruit demanded. If, also, the carrying lines conclude to continue the present arrangement and not avail themselves of the powers granted in the decision, they can save the fruit industry of California, otherwise the future of citrus growers is in grave doubt.

* * *

Progress of the Rate Bill—We are all interested and we may say, vitally, in the passage by Congress of a just and equitable railroad rate law. The Hepburn bill which is now in the Senate, having passed the House, we are told already has one hundred amendments to be offered to it, all of which means that an effort is to be made by that body to procrastinate action until the session is closed. This of course, will be the end of the matter for this term.

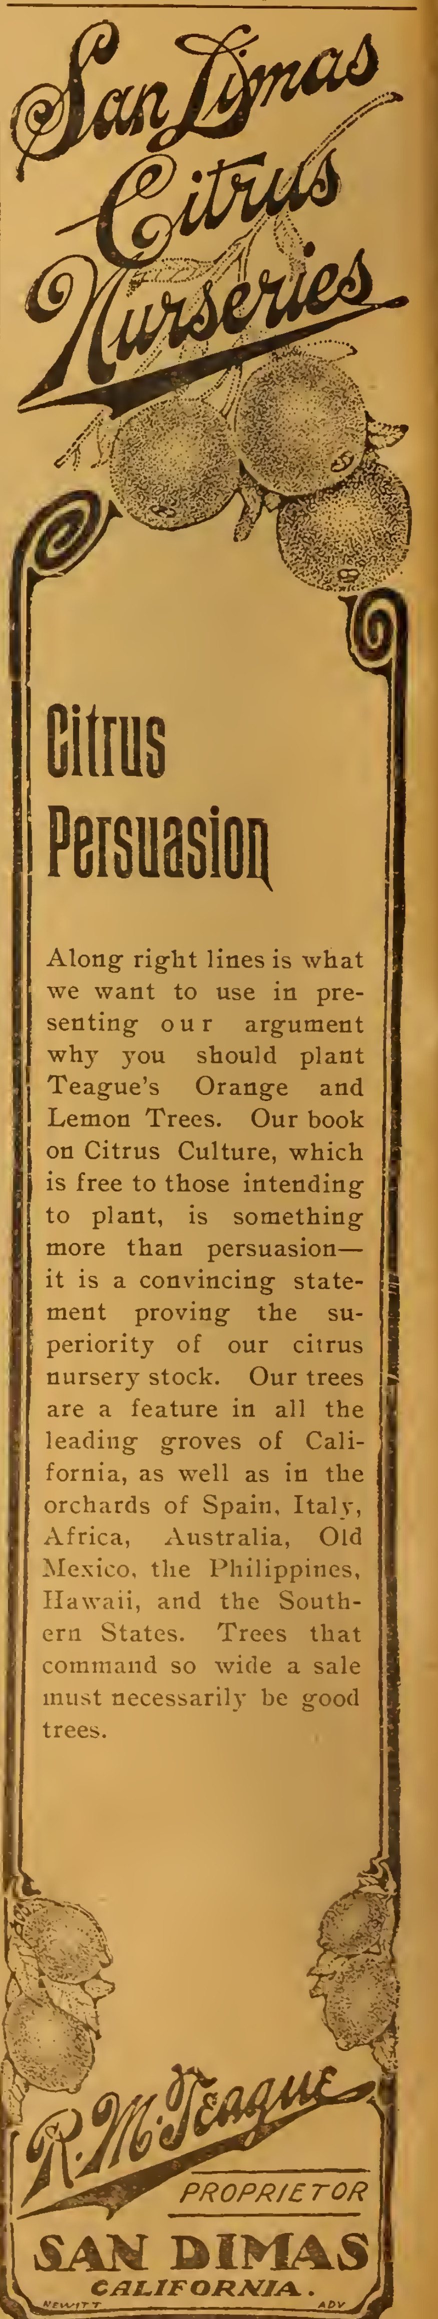
It will be unfortunate if the Senate shall kill this measure, and yet, that is to be expected, for, from the first it has been seen that that body is opposed to any regulation of railroad rates because of the affiliation of some of its leading members with great corporations of different characters. The regulation of railroad rates might lead to the regulation of other interests like the Standard Oil, the Beef Trust, the Coal Trust, and the like, hence the danger Senators see, who are identified with leading commercial industries, in the making of any railroad legislation other than that which exists.

We think it is a mistake on the part of the Senate to defeat any just measure which the country demands at this time. The public is asking but justice, and when these railroad managers deny the right of the government to protect the public against the injury and wrong of an extortionate rate when one is found to exist, they provoke alarm, and invite public condemnation.

The fact remains that these corporations and the people are all interested alike in paceful relations. The farmer and the merchant, the banker and the mechanic, are always prosperous together; and so with those who own the great properties of the country. They cannot prosper unless the rest of the country prospers.

At a celebration of Nebraskans on Lincoln's birthday the Attorney-General of Nebraska discussed this proposition aptly and practically. When he declared, "There ought to be no strife between the people on the one hand and the owners of the great commercial properties of the country on the other. They ought to work together, to live together, and be happy together; but if the owners of these properties refuse to submit to the creation by law of a commission such as the President suggests, a tribunal to hear complaints with power to give relief is just and right, the hope for peace is ended. The responsibility for trouble should it come, will rest with those corporations who deny the right of the government to protect its own people. In this fight there is no neutral ground. Every private citizen and every public officer must stand up and be counted either for or against the power of the government to deal with all men alike. He must answer the roll call in one army or the other."

This doctrine here laid down is the one upon which this government is founded: the doctrine of the greatest good to the greatest number. It was embodied in the proposition of equal rights—the principle that Lincoln stood for—the principle which Roosevelt stands for, and the principle the people will stand for until it is written unalterably and eternally in the statute books of the Republic.



Citrus
Persuasion

Along right lines is what we want to use in presenting our argument why you should plant Teague's Orange and Lemon Trees. Our book on Citrus Culture, which is free to those intending to plant, is something more than persuasion—it is a convincing statement proving the superiority of our citrus nursery stock. Our trees are a feature in all the leading groves of California, as well as in the orchards of Spain, Italy, Africa, Australia, Old Mexico, the Philippines, Hawaii, and the Southern States. Trees that command so wide a sale must necessarily be good trees.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

George Reeves says something resembling the Codling moth is affecting the cling peach in this section.—Pomona Times.

A. W. Young has resigned as Horticultural Commissioner of San Joaquin County, and R. C. Tubbs has been appointed in his place.

The Supervisors of King's County have reappointed James A. Hill, H. W. Brown, and J. E. Tilton as Horticultural Commissioners of their county.

The Limoneira Company near Santa Paula has begun putting fruit in its packing house for this season and has over 30 carloads in the packing house now.

A petition has been presented to the Board of Supervisors of San Benito County, urging the appointment of a Board of Horticultural Commissioners.

G. R. Holbrook has resigned as a member of the San Bernardino county Board of Commissioners , and L. S. Dyar, of Ontario has been appointed to fill the vacancy so created.

Lester Green of Vorden, Sacramento county, has been appointed on the County Board of Horticultural Commissioners, to fill the place made vacant by the death of Senator Johnston.

With a prospect for 5000 or 6000 car loads less citrus fruit this year than last there is every reason to believe that the growers and packers of the fruit will receive fully $3,000,000 more than last season.

Shipments of trees from an Oregon nursery are arriving at Marysville by way of Sacramento. These trees are sent to Sacramento in car lots, and reshipped to other points apparently without inspection. ,

Actual returns from all citrus fruit sold this year have averaged to date $650 a car, against $500 a car for all of last year and $400 a car the preceding year. These figures are for fruit on the cars in California.

The Citrus Fruit Association this week paid to its members $8500 on the January pool for navel oranges. This is at the rate of over 1 1-2 cents per pound for all grades shipped during the month.—Ontario Record.

At the last meeting of the Riverside Horticultural Commissioners George Vankirk was appointed inspector at Corona, and N. H. Hargraves was appointed inscpector at Banning, the former inspectors at both places having resigned.

Our orange growers, say the Escondid Times are selling quite a lot of their fruit now for cash delivered at the packing houses. The prevailing price is one cent per pound, but some extra fancy fruit is bringing one and one-half cents. The above price pays well for growing oranges.

AGRICULTURE.

Twenty tracts of land of five acres each in the Willamette valley section or Oregon are now being seeded with California alfalfa.

On the 22nd a carload of trees were received by the town of Oxnard to be planted on all the streets of the city. Work has already been done on putting them in place.

The townsite of Coachella, Riverside county, in the heart of the section where the melons grow, is reported to have been sold to a syndicate of Los Angeles men.

The Los Alamitos sugar factory reports contracts already signed for over 6000 acres, and beet seed for 3000 acres. In some localities beets are up and nearly ready for the thinners.

In and about Lodi the growers have made big sums of money from Tokay grapes. These figures are accurately given, but there is no reason why Tokay grapes should always bring enormous prices.—Exeter Sun.

"Judge Gibbs," says the San Fernando Press, "has decided that the Los Angeles river runs through the valley in two stories." If that is so why didn't he partition off one story of the river to Los Angeles, and the other to the farmers of the valley?

For a number of years, Oregon dairymen and farmers have felt the need of a crop that would provide green feed for dairy cows during the eight or ten weeks of dry summer weather. So they have turned to alfalfa for relief and have asked the assistance of the railroad people.

A correspondent writing from the Pomona valley district of the fruit and grain situation says: Orange picking, which was interrupted by the rains is being rushed now, and the packers are busy. The grain fields are looking fine, with promise of a big yield at harvest time. Plowing and cultivating is being pushed industriously, according to present indications the beet crops this year will break the record. Considerable corn and potatoes are being planted. The present outlook indicates a banner year all along the line for the orchardist and farmer.

LIVE STOCK.

The Chino Champion says corn soaked whiskey is causing the downfall of many ducks about Lakeview. San Bernardino sportsmen are responsible for the scheme.

It is estimate that the amount of live stock daily killed in Los Angeles and vicinity is 400 beeves, 1200 hogs, and 1500 sheep. This amounts to 12,000 beeves, 36,000 hogs and 45,000 sheep monthly.

Angora goats are going into Napa County in large numbers. The Napa Journal tells of seven carloads of Angora goats, something over one thousand head, hich arrived in Napa Sunday from Imperial, Southern California. They were consigned to the California Angora Land Company.

The California Promotion Committee reports a synopsis of the State Dairy Bureau's complication of dairy statistics for California for the year ending October 1, 1905. The production for the year totals 41,961,047 pounds, an increase of 17 per cent. over the previous year.

Orange county boasts of live stock in the following ratio: beef cattle 150; stock cattle 5560; dairy cows—graded, 1620; common cows 3790; mules 460; calves 2580; swine 2015; horses—thoroughbred 5; standard bred, 21; common 3815; colts 1510; sheep, common 34,200; lambs 8200.

The dairy cattle show which was in full blast at Chicago last week was attended by about 30 Californians, some of whom are leading dairymen of the Sate and in search of the best dairy cows they can find to import.

The Imperial Creamery, much admired by the dairymen because of its completeness has been sold to W. R. Davis of Los Angeles.

MISCELLANEOUS.

The city council of Modesto has levied a license tax on cats.

Last year Oregon, Washington and Idaho shipped 4,000,000,000 feet of lumber.

The schools of Eureka have been closed by the ravages of scarlet fever.

Los Angeles is the tenth city in the country in the matter of building improvements for January.

Some 400 men are at work broad guaging the narrow guage system from Santa Cruz to Alameda.

A public ownership club has been organized in Porterville to work in conjunction with the state and national clubs.

The Visalia Board of Trade will erect a building of its own this season. That indicates progress of the right sort.

Congressman J. N. Gillette of Humboldt county announces through friends that he is an aspirant for the Republican nomination for Governor.

According to the Santa Barbara Press prospecting for oil in the Carpenteria valley will be under way in a few days. Oil men think it is a promising field.

Luther Burbank has donated a number of his rapid growing walnut trees and seeds of his famous Shasta daisies to Alameda scholars, who have selected his birthday, March 7, as Arbor Day.

The people in the eastern part of Shasta county, and particularly in the fertile Fall river section, have started a concerted movement to form a county of their own with Fall River Mills as the county seat.

It is getting so that they regard it as a dull day in Tulare county when some new town doesn't spring into existence. The latest to be recorded is the town of Lindcove, which is to be laid out twelve miles east of Visalia.

Some Illinois people who have located in Hanford during the past year or so have been sending violets from here back to their friends in the Sucker State, and they have landed four shipments with great success.—Hanford Sentinel.

A dispatch from Marysville says: It is announced that the Butte county Canal will be extended this year for a distance of three miles, which will bring it to the south line of Sutter county. A spillway will be run to the Feather River through which to release the surplus water from the ditch. A largely increased acreage will thus be brought under irrigation.

Southern California is on the verge of another era of railroad building. San Diego, says the Riverside Press, is trying to induce the Salt Lake to build from Riverside to that city; the Western Pacific has declared its purpose to build from San Francisco to the southern part of the state and the very latest is that the Hill interests are planning a line from San Pedro to Los Angeles and thence on up the coast.

The F. Gilman Taylor Seed Co., of Glendale Cal,. is out with a fine illustrated catalogue, all of said illustrations being from photographs taken for the express purpose. The day of "stock cuts" for seed and plant catalogues is nearly past for customers soon tire of seeing the same old illustrations, year after year, and in half the catalogues in the land. We believe this new catalogue will prove a strong drawing card for all interested in farm, flower and vegetable seeds. Send for one.

"FERTILIZERS FOR THE LANDS SAKE" A.C.W.

FERTILIZERS

More commercial fertilizers have been used this season than ever before in the history of the business in California. Why? Many growers owing to poor prices for fruit during the past two years discontinued the use of fertilizers trying to save expense—poor judgment. This year prices rule better than at any time in the past five years. The good business man figured on this and kept his grove up with fertilizers he has the crop—he has the money in bank and his grove is in good condition to continue to produce, the other fellow's grove is "run down', and no crop and it will take two years to put in first class shape again—loss of time, loss of crop and money.

We are working overtime and have been for 30 days, but can handle your business. See our Agent in your district for the crop producing A. C. W. Fertilizers.

Prodigious Improvement in Five Months

Over a Million Dollars Are Being Expended by One Company and Its Stockholders on Lands in Kings and Tulare Counties.

Five months ago the Editor of the Cultivator paid a visit to Corcoran, the new town just platted on the A. T. & Santa Fe railroad in Kings county. There was then scarcely the semblance of a village. Only a few tents, a frame building and the foundation of a brick building marked the spot where the future Corcoran was to stand.

Today the scene is changed. With passing wonder the visitor stands upon the site where five months ago his eye could scan the landscape for many miles without seeing a farm house, over thousands of acres of land never scratched by a plow, where cattle ranged year in and year out and fattened on the succulent grasses which covered the country with velvet green and everywhere beholds startling evidence of prodigious improvement. Corcoran is an infant no longer. Industries are going in faster than the fertile mind of the projectors of the enterprise dared to hope. Permanent residents are erecting neat and substantial houses, putting out lawns, cultivating flowers, shade and ornamental trees and gathering around them the necessary conditions for attractive and useful homes.

Five months have brought Corcoran a first class hotel, conducted on modern lines with comforts and conveniences which attach only to larger towns or even to cities, a State Bank with $50,000 paid up capital, a hardware store, bakery, grocery, livery stable, lumber yard, telephone, electric lighting system and the many small shops of different character which are necesary in every town of well regulated importance. Four 2-story and two 1-story pressed brick blocks are nearing completion. The company is laying out the park with large artificial lake fronting the Bank the Hotel and Depot. This park, when completed, will be one of the most beautiful on the line of the Santa Fe. It is to be planted with tropical and native trees and ornamented with flowers and shrubbery of exclusive character. The wide and level streets are to be oiled and shade trees planted along the curbs and to conform in character to the best made surburban streets in California.

* * *

Cannery.—A cannery building is now projected, capable of employing several hundred hands, in which will be packed fruit and vegetable products of the territory, especially asparagus. This cannery will be the property of Mr. D. W. Lewis who has under cultivation at this time 640 acres of land which he is planting to asparagus and which will make one of the largest and most modern asparagus farms in the State. The fact developed, in conversation with experienced gardeners, that the country about Corcoran has nothing to fear from the asparagus rust and this fact, together with the peculiar adaptability of the soil and a climate which seems to give the necessary crispness to the stalk, will make it the Mecca for asparagus culture.

* * *

School House.—Among the buildings under way is a ten thousand dollar Moorish-Mission school house. Five months ago there were no school children to make a school house necessary. Today there are 60 in the district and the teachers are calling for more desk and seat room, thus emphazing the truth of the adage, "Education follows the plow." But this new and beautiful school house will not suffice for any length of time, for at the rate people are flocking to Corcoran, within the near future even this building will be inadequate for the needs of the community.

* * *

Creamery.—Geo. A. Smith, of Los Angeles, one of the most successful creamery operators in California, is now preparing to erect a plant of the most modern type with a capacity for caring for the product of 2000 or more cows daily. This creamery will be the making of the dairy interest around Corcoran for not less than one hundred farmers are now preparing their farms, putting thousands of acres into alfalfa and other crops, establishing pumping plants, many separators, etc., with a view of being ready this fall to begin actively the work of supplying the Corcoran Creamery.

The dairy industry of Corcoran will be its most important adjunct. It will bring ready money to the farmers, consume the products of the entire agricultural district and pour into the country a continuous stream of wealth.

It is doubtful if in all the State there are more natural advantages for the prosecution of the dairy industry than are to be found around Corcoran.

Within the Next Few Months Corcoran Will Have a Mammoth Creamery in Operation.

With from four to seven crops of alfalfa cut and stored a year: with wheat, oats and barley giving wonderful returns; with vegetables raised to perfection, it is no wonder that cows return handsome profits.

Mr. Wilde told me that they have, on the Charles place, 65 cows which net them $60 each per month, outside of the skim milk he feeds his calves and hogs and above the calves produced. He is shipping his cream to Hanford at that. When he delivers his cream at Corcoran, six miles from his dairy, his revenue will be increased very considerably.

* * *

Soil.—I have before spoken of the character of the soil about Corcoran. I am impressed, the more I study it, with its marvelous producing power. A silt loam filled with vegetable matter, just enough weight to give it body and warmth, the farmer needs only to cultivate it well to proiuce corn twelve fet high, with one irrigation to put the soil in condition for planting and another to fill the ear at tasseling.

* * *

Irrigation.—With water nine feet from the surface, in the dry season alfalfa grows and matures, is cut and stored and merrily grows on, year in and year out, with less moisture needed than in any other country we ever saw. Verily it is the farmer's paradise.

Stockmen and Dairymen in the Tulare Lake District are Arranging to Build Silos This Season for Their Cattle. They Will Be Filled With Corn Silage.

King's county has the best, the cheapest and the most reliable irrigation system known to this continent.

* * *

Every Farm Can Have Its Own Water System.—The people, and not great corporations, own the water and the expense of irrigation is confined to the simple charge of keeping up the ditches, with their headgates, drops and flumes, in repair, and distributing the water.

John Lachenmyer, an extensive and successful alfalfa raiser, has a pumping well which produces over 150 miners inches, capable of taking care of 400 acres so he says. So it is with many other farmers. Of course the artesian wells are the wonders. Think of wells that gush a stream of water three or four inches over a six or ten inch casing and run day and night. Yet we saw several doing this and before the close of the season 16 artesian wells will be sunk within a radius of five square miles. On the lands of the Security Land and Loan Company are now 36 flowing wells, 14 pumping wells, and 9 rigs constantly at work developing more and securing in every instance abundant supplies of excellent water, and the work has only begun.

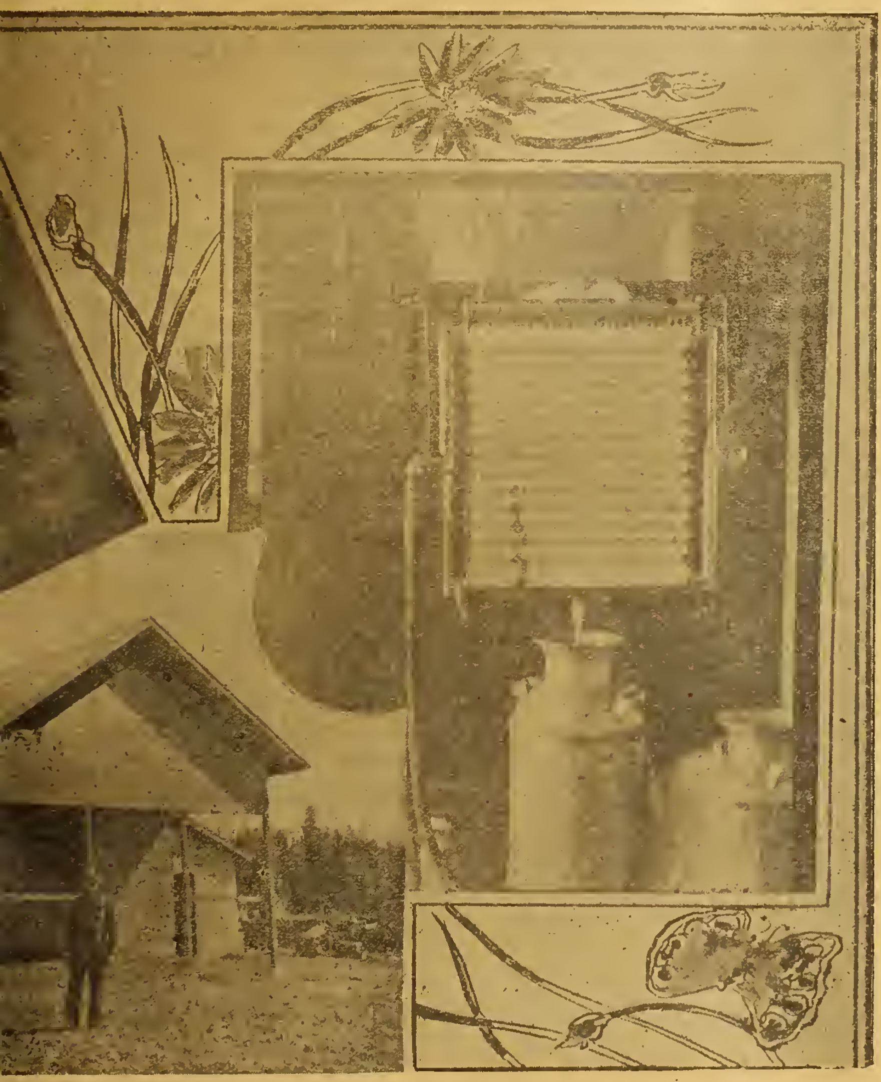
Without irrigation the dry plains of Kings county, in their wild state, produce alfilaria (Filaree) and other native grasses sufficient to graze, in ordinary seasons, not to exceed one head of stock to two acres of land per year. Properly irrigated these same plains exceed in fertility the famed delta of the Nile, as witness the raisin vineyards and orchards of deciduous fruits, not only the largest in area but the greatest in volume of production in the world. An acre of alfalfa, properly irrigated, will produce in one year from five to ten tons of hay worth from $6 to $10 per ton. and in addition thereto will pasture four head of cows for six months. Many of her irrigated peach orchards annually produce twelve tons per acre of green fruit, and her prune, pear and apricot, nectarine, plum and almond orchards in like proportion.

Thus it will be seen how important irrigation is to the soil of this country.

Her sources of water supply, in addition to artesian and pumping wells, are chiefly the two great rivers, the Kings and the Kaweah, having their sources in the higher Sierras, eastward from sixty to seventy-five miles, and they never fail to bring down to the plains from the glaciers, chasms and wooded slopes of those great mountains, each year, an abundant supply of irrigation water to meet all the needs of Kings county farmers. They fill his ditches and keep them full the year round, so that his orchards and vineyards may be wet at the most effective time and his grain and pasture lands are kept moist and productive by seepage without flooding.

* * *

The Stockman's Paradise.—I think the future of the Corcoran district will be famous for its dairy, hog and cattle productions. It is peculiarly adapted to growing and finishing stock and hogs for the market. A. P. Denny, of Angiola told me that he sold a carload of Shorthorn steers last week at 6 cents, at his farm. These steers weighed 1300 pounds and never were fed a pound of grain. What would the middle West stockman think of sending his cattle to market without finishing them on grain? He would indignantly declare such proceeding unheard of, yet the farmers in the Corcoran country are getting rich from stock they raise which is fattened on alfalfa at a cost not to exceed ten dollars a head. This phenomenal fact and also the farther one that lands are selling at such low figures, is inducing farmers from the East to locate in this valley. They are coming in large numbers and before the close of this year many thousand acres will be covered with fine young cattle imported into the country. From experience with Hereford cattle I venture the opinion that they would prove the stock for this region. Their quick maturity, readiness to fatten on grass that many other breeds would only subsist on, give them advantages of peculiar worth to a country like the Tulare Lake region.



A Dairy Plant. Kings County, Around Corcoran, Has Many Such.

However we presume other classes of stock would do proportionately well and, if so, the stock men ought to be satisfied for we doubt if the same favorable conditions for the cattle industry obtain anywhere else in the State as are found here.

One of the coming requisites of the dairy industry is the silo and I was pleased to hear several farmers with whom I talked aver that they would follow their irrigation plants with modern silos. We present in this article a picture of a silo, the counter part of which a dairyman near Corcoran proposes to erect this fall. He expects to fill it with corn to be prepared for silage to tide over any possible emergency.

* * *

Wheat Yield.—Phenominal as has been the output of cattle, hogs and dairy products from the Tulare Lake region, greater even has been the showing made in wheat. From a sowing of about 180,000 acres in 1905 a large portion harvested 60 bushels per acre. This year the acreage has been materially increased and the prospect for a bountiful return of the harvest as shown from the grain in the field has never been surpassed. It is estimated that over 250,000 acres are being sown to wheat in this section this season.

What is true of the wheat crop is also true of barley. I saw barley on D. W. Lewis' farm which stands ten inches in the stalk and a better growing I have never seen for grain sown less than fifteen weeks ago.

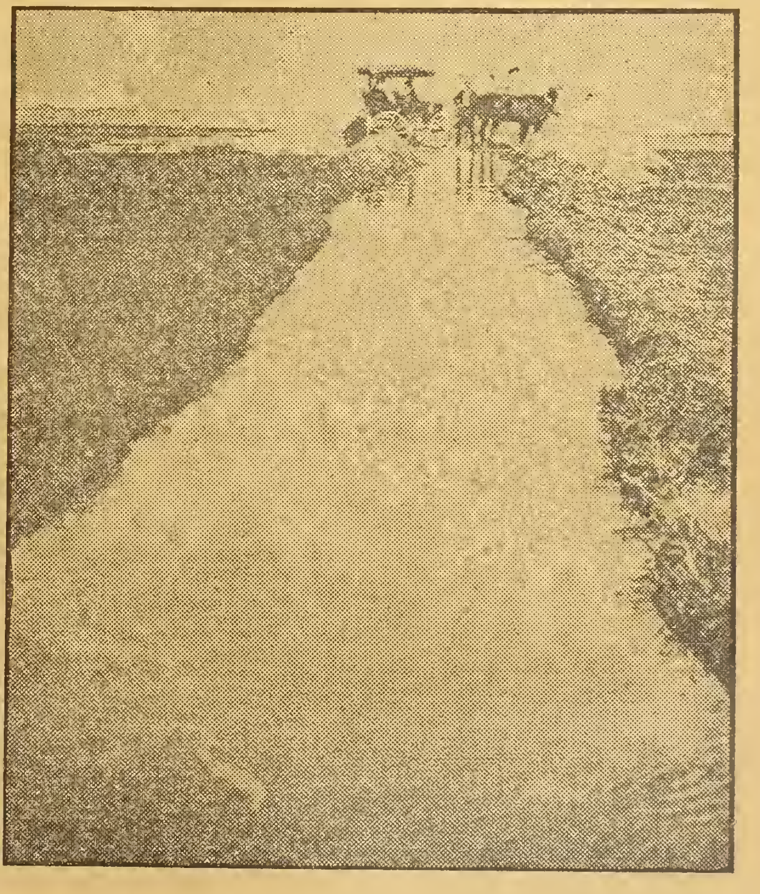
* * *

Fruit Industry.—The purchaser of every 40 acres in the Corcoran district binds himself to include in his regulation improvements at least ten acres of fruit trees, berries, ornamental trees and shrubbery. The great variety of fruits possible to be grown in Kings county renders it an easy proposition to figure the relative returns to be received from grapes, prunes, apricots, berries of all kinds, apples and figs. The coming of a cannery to Corcoran will furnish a near market for all corn and vegetables the country can produce. It is a well-known fact that California cannot begin to furnish the canned goods which the cities and towns demand, hence we send to the East for what is lacking in this particular. Corcoran will add another industry in its cannery to supply the needs of the State and incidentally add to the wealth of the fruit growers of the region known as the Tulare Lake district.

We cannot close this somewhat meager resume of the advancement made in Corcoran and its tributary country, without mention of the heavy investors in the enterprise. They are among the leading business men of Los Angeles, Hollywood, and Hanford. The directors of the company are W. C. Patterson, Gen. H. G. Otis Arthur Letts, J. B. Brokaw, George Hanna, Alan Gardner, Robert Hale, J. Jepsen, A. J. Pickrell, L. S. Chittenden, A. F. Flory, P. B. Chase, M. R. King, O. J. Wigdal and H. J. Whitley.

The president, financial manager and a large owner in the enterprise is H. J. Whitley, well known through his large developments in the Middle West and more recently through his extensive operations at Hollywood. It is he who is guiding this development and who, supported by his able assistants, aims to make here a model temperance farmers community.

All deeds to lots and adjoining acreage contain clauses prohibiting the opening of saloons or bars or the sale of liquors, thus giving protection to the home from the saloon evil. It is their intention to make of Corcoran and its tributary country, a region to be sought after by Easterners who are looking for a fine climate with a soil unsurpassed in richness, where water is abundant and returns from agriculture, horticulture, stock and dairy, will make the industrious farmer rich.



Canal Supplied by One Artesian Well on Property of Security Land and Loan Company.

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

Editor Cultivator: I was interested in your account of the value of the silo. We have started in a small way with the family cow and horse, and 1500 chickens. One of the greatest wants we have is green food for all. Now if a silo will help us get it during the dry season we will be grateful indeed. We will plant a small patch of alfalfa, raise mangels, kale and I think some fodder corn. Now how do you build a silo, and how do you pack it?

It will not pay to build a silo for less than ten cows, as four or five inches are necesary to be removed daily from the top to prevent waste by moulding. The various brands of alfalfa meal will answer to give protein and for succulency roots must be depended on largely, with pumpkins to help out. Cutting alfalfa hay and letting it remain over night well wetted down to heat and swell will also help out the feeding. In feeding a cow the milk will not be contaminated if cabbage or turnips are fed, if it is before milking time, long eough to let the animal breathe off the aromatic gas, so most people say feed directly after milking. The droppings of the cow that occur during milking should be covered with earth at once, the milk will be all right.

Editor Cultivator—I have a cow that has been ailing and losing flesh since she last calved about six months ago, second calf. She seemed to have had no trouble in calving but since then I have noticed that she is breathing with an effort and a rattling sound in her throat. I find she has a swelling in her throat. which feels hard and round and also some smaller soft lumps underneath jaw. Appetite is good, feed her on hay and bran also has run of field, no cough, age nearly four years. If you have a remedy for above I would greatly appreciate it. P. J. K., Santa Rose.

The obstructions in the throat will fully account for the labored breathing. If the lumps are soft they may contain pus, and if so should be opened. If they are on the jaw are usually actinomycosis or lumpy jaw. The following is helpful: Tincture of Iodine 2 drahms, Oleum Tiglii, 1-2 an ounce, Alcohol 2 ounces. Mix and apply with a brush to lumps, label poison and keep it away from the children. It should blister the skin and act as a counter irritant. In lumpy jaw the bone is affected on the inside and the enlargement presses against the windpipe.

Editor Cultivator—I have a cow that is troubled with her stomach sometimes she throws her cud out of her mouth. I was told to give her saltpetre and sulphur. Do you think it would be good and what would be the dose or do you know of anything else that would be better. E. R. Santa Rose.

As to the general condition of this cow, if very thin or if the trouble is of long standing I do not know. However, the first thing to do is to examine her mouth and tongue for fox tail or for barley beards. If there is no difficulty there, begin by giving the cow at night a drench of one pound of Epsom salt with a couple tablespoonfuls of ground ginger. After this has worked off, give her daily the following divided into two doses: Sulphate of Iron, 2 drahm, Powdered Nux Vomica, 1 drahm, Powdered Gentian 1 ounce.

This may be mixed with bran or given as a drench, continuing for one week, watch the bowels, if they act too freely reduce the medicine, feed the cow green stuff and bran, oil cake in moderate quantities. not too much of anything at one time. If after a week the cow is better stop medicine and feed her carefully. This trouble is usually thought to arise from feeding too much dry, harsh food.

RECORD OF GOLDSETTIE OF LA PALMA

Editor Cultivator—Herewith find records of Goldsettie of La Palma 181126. Sire Golden of Biltmore 60 082; Dame Wintsetter's Regina 141-188. C. W. Leffingwell Jr. Owner, Whittier Cal. It does me great pleasure to report a young cow like this as this heifer is. so far as test goes, (first month of test,) the best record of any young cow of same age, two years, two months at commencement of test, in America. There may be others . Let us hear from them. These tests are based upon authenticated butter fat estimates and not from seven day butter tests—the real thing, just what the cow produces no more no less.

Goldsettie gave Jan. 21, 1906, morning 15.5 lbs milk testing 5.9, .914 lb fat; night, 12.8 lbs milk testing 5.8, .742 lb fat; Jan. 22nd, morning, 15.4 lbs milk testing 5.00, .770 lbs fat; night, 16.00 lbs milk testing 5.5, .880 lbs fat. Total milk 59.7 lbs; total fat 3.306 lbs. Average percentage fat 5.53. For the first month of her year's test commencing Dec. 26, 1905 to Jan. 25, 1006 inclusive she gave 893 lbs 7 oz. of milk. To this is applied the average per cent of fat 5.53 equal to 49.405 lbs fat; butter 83 per cent, equals 59.524 lbs.

Her dam, Winksetter Regina has just finished her one year authenticated butter fat estimate, which is 8,874 lbs 13 oz of milk; 406.6 oz butter fat equivalent to 58.623 lbs butter 83 per cent butter fat.

Veterinary

BY DR. W. I. OLIVER,
318 East Second St., Los Angeles

Editor Cultivator—Will you please give me your advice in the columns of the Cultivator in a case of distemper with one of my horses. Last July the mare took distemper, the gland on her left side below the ear began to swell, also a lump on her throat. A local veterinary lanced both places and there was much discharge from the sores. The animal ran down in flesh and I doctored with her until about December first without working her much. Since that time she has gained and is looking fair but a few weeks ago a lump gathered on the left side of her neck below the ear almost the same spot we lanced last summer, and yesterday it broke and there was plenty of pus discharging. H. C. H., Gilroy, Cal.

In writing the answers in last week's Cultivator I answered the questions as numbered. I see they were not so numbered in the paper. Consequently you could not find No. 5. Your mare was treated all right but the wounds may have healed before all the effete matter had sloughed out. Your recent attack I believe from that cause. If any enlargement remains you should apply a mild blister to the parts. Cantharides one to four of lard is good. In lancing always make a good dependent opening. You can cleanse it out better and inject a little of the following: raw linseed oil, spirits turpentine, comp. tinc. benzoin, 3 ounces of each. Shake before using.

LUMP JAW

Editor Cultivator—Please tell me what to do for my cow. A lump has grown on her jaw well back, she eats

Dr. PAXTON'S COUGH AND THROAT REMEDY. TRADE MARK

For Catarrhal Fever

Pink Eye, Distemper and all diseases Nose and Throat

Cures the sick and acts as a preventive for others, and is given on the teeth and tongue. Safe for Brood Mares and Colts and all others. $1 00 per box, ½ doz. $5.00. Sold by druggists, or sent express paid.

A Big Difference

One Minute's Washing as compared to at least fifteen. Wouldn't you like to save at least fourteen minutes twice a day? **One minute** with a cloth and brush cleans the absolutely simple Sharples Dairy Tubular Cream Separator bowl shown in the upper picture. It takes fifteen minutes to half an hour with a cloth and something to dig out dents, grooves, corners and holes to clean other bowls—one of which is shown in lower picture.

Washed in 1 minute

Count the pieces — notice the difference—and you'll understand why the one who has to do the cleaning prefers the simple Sharples Tubular.

There are other advantages just as much in favor of the Tubular. Write today for catalog V-260—it tells you all about the gain, use, and choice of a separator.

The Sharples Separator Co.

Thick Cream

SELLS FOR ONE CENT MORE PER POUND THAN THIN CREAM

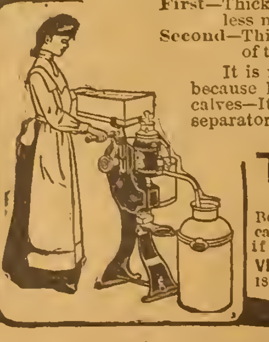
The creameries of the country have become so convinced of the increased value of thick cream over thin cream that many of them are paying one cent per pound more for cream testing 30 per cent. and over than for that testing under 30 per cent.

The reasons for this are—

First—Thick cream makes better butter because it contains less milk and therefore keeps in better condition.

Second—Thick cream is so much less in quantity that the cost of transportation is less.

It is much better for the dairyman to make thick cream because he has more skimmed milk left at home to feed calves—It then follows that dairymen should buy only such separators as can separate thick cream.



The U. S. Separators

Lead the World in this particular

Beware of the cheap and poorly constructed Separators that cannot make thick cream. They would be expensive even if furnished without cost.

VERMONT FARM MACHINE CO., Bellows Falls, Vermont.

18 centrally located distributing warehouses throughout the U.S. and Canada.

Prompt Delivery Assured California Customers from San Francisco Warehouse No delays. Address all letters to Bellows Falls, Vt

well, gives a little milk and will be fresh about April 10th.

The cow may have lump jaw, I fear she has. If so look back in the Cultivator for treatment which was published about a month ago. If the lump comes from barley beards or bronchos they may be cut out. Your best course is to have the cow examined at once by a veterinarian of experience.

BARLEY TESTS.

In a five years' test of barley at the Montana Experimental Farm it was found that New Zealand, a 2-rowed barley, gave uniformly good results during five years and ranked first with a yield of 82.5 bushels per acre. Berkeley a 2-rowed beardless variety, stood last in yield with an average of 46 bushels per acre, and also in weight per bushel with 51.4 lbs. Guy Mavle, a hulless variety, gave an average weight of 64.6 lbs. per bushel standing first in this regard. No. 5590 obtained from the Department gave the second largest yield, averaging 77.7 bushels, and Mandscheuri California Prolific, Italian, Manhattan, and Improved Cheyenne produced over 70 bushels for the five years.

Mr. A. P. Robinson of Riverside, who has some fine standard Wyandottes, advertises his ability to supply eggs in the Cultivator.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

BREEDING

In our last we talked about line breeding, in-breeding and outbreeding and I tried to explain that line breeding is a very careful inbreeding or a breeding of fowls related, having more or less of the same blood. It is by very close in-breeding that all the new breeds are established and it can be done with perfect safety so long as healthy, vigorous birds are used. By line-breeding you can perfect or intensify the different qualities in your birds and you can control these qualities in so other way.

To illustrate, I had a hen hatched on Thanksgiving day(and many a time I have given thanks for her) I kept her nearly seven years. She laid 225 eggs in nine months when in her prime. She was vigorous and healthy and wishing to perpetuate her good qualities in her offspring I mated her to her son, and the following year to her grandson. Three-fourths of my prizes came from this mating. I sold her eggs at five dollars a setting. I put this high price on them because I did not want to sell and I knew there were not many who would give that price, but some did buy. One gentleman wrote me from Sacramento that he put the thirteen eggs into his incubator with a lot of Leghorn and Wyandotte eggs. Ten of "Snow Queen's eggs hatched. One chick was accidentally killed the first day, the remainder, nine grew up to be large, sturdy fowls. Although they were brought up in the brooder with Leghorns and Wyandottes which had roup and chicken pox and all the ills consequent on poor quarters and neglect only about fifteen per cent surviving. The owner wrote me that Snow Queen's offspring were so healthy and vigorous that they seemed immune to all diseases. The nine grew up, two took first prize, cock and hen and the five next won first prize pen in strong competition with Eastern birds. The owner wrote me he considers his five dollar investment paid and added that the special strong feature was the vigor and healthfulness of the birds. These were line-bred birds, having seven-eighths of Snow Queen's blood.

At the last Farmer's Institute I attended a farmer came to me, "I have some of your Snow Queen's daughters three years old. One of them laid in one hundred and ten consecutive days one hundred and five eggs." Thus showing what line breeding in the right way will do.

Every year I also very carefully outbreed in only one pen. That is I buy, sometimes at great expense, the best new blood of the country so that I might have some non-related fowls, for mating, but it was the line-bred birds that I could rely upon to give me prize winners and also those were the grand egg producers. the vigorous healthy fowls that I could depend upon to give me over two hundred eggs per year. Do you wonder that I advocate careful line-breeding?

I knew every bird on my place, I could tell you the pedigree of most of them and I knew the egg record of all of them. Their proper mating was as great a matter of concern to me as the marriage of the President's daughter and I made a success of the chicken business.

Cross breeding or out crossing is mating two fowls of distinctly different breeds. Such as mating a Plymouth Rock with a Leghorn. What would or what might be the effect of this? And would it be of any benefit?

It would very much depend upon the prepotency of the birds, the stronger one would mark the offspring most strongly. The one that is the most bred-in-line would give most strongly his or her impress on the offspring. The first cross will frequently give better layers than either side, the first cross may improve the laying qualities in fact it usually does. What will be the result of the next mating? Which parent will you follow? You cannot keep the even balance and the chances are ten to one, or a hundred to ninety-nine that the offspring will be nothing but mongrels and that in egg production they will be so poor that you will either denounce the poultry business as a delusion or you will return to the thoroughbreds for they and they only, can be depended upon to give the best results, the greatest out put of eggs and the best market fowl.

EGG FOOD NO. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

The cross breeding of fowls is very similar to that of cattle or horses. At one of the Farmer's Institutes a question was asked about crossing Holteins and cJrseys, the Jerseys giving very rich milk, but less in quantity than the Holsteins whose milk is not usually as rich. The reply of the Professor was that it occasionally might result in the first cross having the good qualities of both parents, but it would more frequently be found that the offspring would have the poor qualities of each strongly pronounced and then he inquired what would the next generation be? It is practically the same with fowls, unless you want to build up a new breed and will have the patience, the money and the intelligence to do so waiting always for years for the results. Keep to the Standard fowls and let some one else develop new breeds.

If I had space I could tell you of some of my experiences, both in out breeding and in cross breeding, costly and disastrous to my pocket book, but experiences which made me study the question of breeding and mating more thoroughly than anything else would have done.

Experience is a good, but expensive teacher, and her lessons are worth remembering. I learned in my own case that it is safer to breed in line unless there is some defect to be corrected than to introduce new blood of the same breed, or out-breed through a female. As a rule the fowls take the feathering, the colors, from the male, the shape and size from the mother.

DOINGS OF THE SAN DIEGO POULTRY ASSOCIATION

Editor Cultivator—I thought it would be a good idea to place before your readers the doings of our incorporated poultry association, as the plans are worth trying by poultrymen in any locality where about twenty-five members can be secured.

Our constitution reads about like this: "We have voluntarily associated ourselves together for the purpose of holding annual exhibitions of purebred poultry, poultry products and pet stock: to secure better prices for our products and lower prices for grain and poultry supplies, to buy and sell grain, foods, poultry supplies and poultry products; to establish a depot where the stockholders and others can buy or sell all articles necessary for the carrying on of the poultry business, and to maintain and carry on the same."

Individually we could not buy to any great advantage nor dispose of our surplus stock and eggs at the highest obtainable price—but where the Association through its store, orders grain, or other supplies in large quantities a bottom figure can be secured, and adding to this a small per centage to cover expenses of our depot we can then resell to our members at a discount that in the course of a year's purchases cuts a wide swath in the expense columns of our members.

We have been selling wheat to our members at $1.45 per cwt. about 40c better than retail price. We also sell to the general public at the prevailing retail prices, which is a source of income that aids to pay the expenses of maintaining our store.

Every member has his advertisement in the store, telling what breed he keeps, and what his stock and eggs can be bought for, and the poultry people are fast taking to this idea,

Standard Bred S. C. White Leghorns

YARDS—CORNER MOORE AND CHAPMAN STS.

and many sales follow that net the store ten per cent. About a dozen coops are always on hand filled with fowls of various breeds to sell, also eggs for hatching in any quantities. Our members meet there to discuss poultry matters, the novice stops in for advice, and we are fast establishing a central point where the fancier and rancher can rest, talk poultry, write letters, become acquainted with others and make his purchases, etc. We have not yet arranged to receive and market all the eggs from our ranch members for general table use, but expect to get around to that soon.

Our receipts are showing a gradual increase right along and the experimental period is now passed and the movement a success. Harry A. McIntire, Sec'y.

BREEDING AND FEEDING FOR EGGS

Mr. M. Ward, of Gosford, whose Orpington pullets won "The Daily Telegraph's" first laying competition, in Australia, writes on the subject of breeding for eggs, in that journal: "I have devoted some years to the study of breeding utility birds, and believe that the Orpington stands out first in this respect, being hardy as chicks, quick growers, making excellent table birds at from four to six months old, and up to 12 months or longer in the case of hens.

"I have always found the best layers to be short-legged birds, fairly long in back, full round breast, tight in feather, having neat heads, a trifle small (a big-headed hen is never a good layer) and quick and sprightly in all their movements; always on the alert, as it were. Great care should be taken in selecting the cock bird, as he is half the pen, and if he is of a poor laying strain, the young cock will, in most cases, take after him. I have had some difficulty in selecting cock birds to mate with my hens, which by the way, I always breed myself, as it is difficult to know the laying qualities of another breeder's stock birds. However, I have been very successful in this matter by buying only from reliable breeders whose word I could take.

To breed good layers, if one has good stock to start with, it is absolutely necessary to feed well from the time the chicks are hatched, as no matter how good the stock birds are, if the chicks get starved or stunted in their growth, they will never make good layers. At the same time, forcing must not be attempted, or the pullets will begin to lay too early, and that should be avoided. I have had Orpington pullets laying at four and a half months old, but I do not like them to lay till they are at least six months old, by which time they are fairly well grown and developed. I find that those that lay very young go off laying after a little while, sometimes moulting quite out of season, and then going months before they begin again.

"The feed I give my chicks at first is oatmeal and shell grit, very fine. After two days finely-ground corn mixed with the oatmeal, then some rice once or twice a day, plenty of nice green feed twice a day, (lettuce, rape, or cabbage), besides a grass run, always keeping plenty of shell grit and clean, cool water before them. When they are nine or ten weeks old it is best to separate the pullets from the cockerels, and feed them three times a day, always giving them the best feed that can be bought. At ten weeks old they get middlings and bran in the morning, two parts middlings to one of bran, if the middlings is coarse, but if it is fine, floury middlings then I mix quite half bran, always using the finest bran I can get. The corn I use is the hard kind, called, Flint corn, or large ninety-day. It is also best to get milling wheat, as it is really cheaper than the chick-wheat, even if one has to pay 6 or 8 cents a bushel more for it. The feed I give at ten weeks to four months old is mash in the morning, wheat and green stuff at midday, corn in the evening. I cull out all I can at four months old, keeping only what I consider the best.

"I find it best to run my fowls in small lots, having proved that five pens of fowls, with ten birds in each pen will do very much better than one pen of fifty having the same space as the five pens. After the birds are four months old I drop the midday feed of wheat, and give it to them at night alternately with corn until the hot weather sets in, when I discontinue corn altogether. I never feed oats or barley, as I do not like them.

"In selecting pullets to breed from, I generally take note of those I think most suitable for my purpose, and pen them with a cockerel, noting which ones lay the most eggs, and eventually breeding from them. I have never used a trap nest. but can quite understand how useful they are to those who have time to attend to them. Any man who is constantly among his fowls can easily note which hens lay the most eggs, and after a very short time, if he takes particular notice of the eggs, he will see that almost every hen lays a different kind of egg, and by doing this he can tell which of his hens lays the most eggs.

LAYING HENS

We have a few choice 1½-year-old Thoroughbred White Leghorn hens, which we are offering at a sacrifice. In order to make room for our young stock we are offering these fowls at $15.00 for 12 hens and 1 rooster or $100 per 100.

We also have a number of 5-months-old pullets, also of the same variety, on which we can name you the same price. If your stock needs renewing, send in your order at once, as they are going fast.

We have a Hatchery of 50,000 chicks per month capacity, from which we are making shipments daily to all parts of the Coast. If you need any just hatched chicks have your order booked at once, so as to get them on the date desired. Our price for just hatched chicks is $7.50 per hundred f. o. b. Petaluma.

We manufacture the famous MUST HATCH INCUBATORS AND BROODERS and a complete line of poultry supplies of every description. We cater to the best hatching egg trade on the Coast.

Before purchasing write for our new illustrated Catalogue B. which contains descriptions, prices, etc., of all our goods.

Must Hatch Incubator Co., Petaluma, Cal.

NEW OFFICERS.

At the annual meeting of the Southern California Poultry Breeders Association last Tuesday evening the following officers were elected for the coming year, W. M. Humphreys, president; V. Price Brown, first vice-president; G. I. Royce, second vice-president; Mrs. A. Basley, third vice-president; L. R. Walton, secretary; Harry Rose, treasurer. Executive committee as follows, L. E. Berken, M. E. Dillingham, C. D. Hubbard, D. K. Adland and C. T. Paul.

LINES TO THE INCUBATOR

Mr. Gardiner, the Pinkerton man, sends in the following, in answer to "Lines to the Hen," which appeared in the Cultivator a week or so ago.

Twinkle, twinkle, little light,
Hatching eggs with all your might,
Not needing smokehouse nor the barn,
Nor any old place upon the farm.

But simply standing where you're set,
You'll hatch a hundred eggs I'll bet,
Beating hens quite ten to one,
And never cackling when its done.

Twinkle, twinkle, all the day,
"Pinkerton" has found a way,
To beat the hen at hatching eggs,
And sends the mortgage down ten pegs.

SOME FINE ORPINGTONS.

When the writer was in San Francisco attending the poultry show he scraped acquaintance with Judge T. E. Orr, secretary of the National Poultry Association, and at that time judge of the Orpington class in the show.

When asked as to the qaulity of California birds compared with the Eastern he replied, "You have some magnificent stock in this State the equal of any I have ever seen in the East. By the way, there is one bird here which I consider as fine a bird as I ever saw in my life, of any breed.' He then took us to see the first prize cock bird of the Orpington class, and to hear him extol the good points of form, feather and color was sufficient to make the heart of any fancier glad.

At that time neither he nor the writer knew to whom this bird belonged but afterward it proved to be one owned by Percy L. Harley of Redlands. Mr. Harley is the owner of Featherly Farm and has it stocked with some beautiful birds, principally buffs, but some black and white Orpingtons.

At San Francisco he made nine entries and won eight prizes and a special. At San Diego, eleven entries, eight prizes and a cup and in Los Angeles ten entries, nine prizes and a special. Thirty prizes in all, including ten firsts and nine seconds.

Considering the magnificent stock which Mr. Harley carries, he makes very reasonable charges for his eggs.

A stroll through his yards is a pleasure because of the absolute neatness with which they are kept and the systematic construction of building and fences.

In addition to his poultry Mr. Harley is a great admirer of Airedale Terriers, a most intelligent and useful breed of dogs.

A special sale list of fine poultry stock is advertised this week by the El Oro Poultry Farm of Fresno. Mr. Holland is thoroughly reliable and handles only first class birds.

Mr. H. A. Phelps of Riverside makes a low price on Standard White Wyandotte eggs which he advertises in the Cultivator.

Mrs. Albert Miller has Barred Plymouth Rock and Buff Orpington eggs for sale. See add

The above list is not culls, but regular stock grown from my best pens, such as win in hottest competition. They are bred for utility as well as show and sold at popular prices that appeal to the fancier with a small purse. My profit comes from the great number of sales made on the Pacific Coast at moderate prices, such as $1.50, $2.50. $3.50 and $5,00 per head or $3 50 to $5.00 and $10.00 per pair or trio. If you actually wish stock or eggs let me hear from you before the stock is all picked over or my books filled to overflowing with setting orders. **Healthy, Ranch Grown Fowls.**

H. H. Holland, Prop. El Oro Poultry Farm, Fresno, Cal.

Chamberlain's Perfect Chick Feed

"Nothing Just as Good"

World's Chick Feed of To-Day. The only original Dry **Chick Feed.** All others are worthless imitations. **Chamberlain's Perfect Chick Feed** was used exclusively at the great St. Louis World's Fair during the 7 months. This the highest compliment paid to any manufacturer of poultry food in the world. Perfect Chick Feed also endorsed by the U. S. Experimental Station and the Columbia School of Poultry Culture. All the leading poultry men of the country use Chamberlain's Perfect Chick Feed on its merits.

"Nothing Just as Good"

CHAMBERLAIN'S PERFECT MASH EGG FEED,
THE WORLD'S GREATEST EGG PRODUCER.

GERMAIN SEED CO.,
Pacific Coast Agents. LOS ANGELES, CALA.

SPECIAL PRICES ON TON LOTS.

Distributing Agents: FREDERICK BROWN, San Jose; CHAS. H NEARPASS, San Diego; CHANNEL COMMERCIAL CO., Santa Barbara and Ventura.

Queries and Replies

TIME TO PLOW PEAS.

Editor Cultivator: Will you please inform me through your valuable paper if peas sown in an orange grove make more nitrogen by allowing the young peas to fill out well before discing? If not, when is the best time? —Subscriber. Upland.

We have not the information regarding the amount of nitrogen gathered at any particular time of growth of the pea but it has been demonstrated that some other varieties of legumes give the best practical results if turned under at the time that the majority of the pods are about grown. It has been shown by following legumes with wheat, the yield of the latter was fully doubled (when legumes were plowed in when majority of pods were nearing full size) over the yield given when following the same legumes which were plowed under just when they were in bloom. What the effect on orange or lemon trees would be, we cannot say, but would suppose that the pod stage would be the best.

EUCALYPTUS TREES.

Editor Cultivator: Please advise me in your next issue what is the best eucalyptus tree to plant for wind break. I do not want the blue gum as same sheds the bark. I have plantsome E. rudis but cannot get any more. What is the next best? I want a tall grower also ornamental. Climate dry in summer; sometimes very hot; average rainfall 20 inches; no irrigation. Plenty of wind in summer. I want a variety that does not shed its bark.—T. A. Vacaville.

There is no such thing as a eucalypt with persistent bark under all conditions, but like rudis, the following usually retain their bark: sideroxyton, viminalis, rostrata and polyanthemos. Only those are listed which are believed to be easily procured and to thrive in your section.

SHADE TREES

Editor Cultivator—My house is situated in an orange orchard surrounded by fifteen year old orange trees, but we have neglected to plant very many shade trees around the house, and now feel the want of them. Would you be kind enough to give me the names of a few nice trees that would answer my purpose. I want a large tree and would prefer a deciduous tree, but of course am not set on this point, and would be glad to follow your advice. A. G. S., Porterville.

No finer deciduous shade tree can be found than the Spanish or Italian chestnut and it will yield profit as well as nuts. Better plant at least two as a single tree is often "self-sterile" and does not bear nuts. A good smaller tree would be the pecan. For an evergreen nothing can surpass the pepper tree for yard shade.

630 EGGS
A Month from 24 Hens

"I have been feeding my flock of twenty-four hens for some time with Prussian Poultry Food, and for the last month they have averaged 21 eggs a day. I think this record is hard to beat."
Mrs. Lewis Hilt,
Lebanon, Ohio.

PRUSSIAN Poultry Food

has no equal for putting hens in laying condition. Also the best safeguard against epidemics. Prevents and **Cures Chicken Cholera,** Roup, Gapes, etc.

In 25c and 50c Packages, Pail, 25 lbs. $3.50.

Use Prussian Lice Killers, Liquid or Powder.

"Poultry Profits," is a book you should have. 36 pages; practical, helpful. Free if you write us what stock you own. Address

Climate and Crops

General Summary.—The weather continued warm and cloudy most of the week, with slightly lower temperature in the Sacramento valley and several days of bright sunshine in the South. Light showers were frequent in all sections and heavy rain and snow fell in the mountain districts.

The rain caused a partial suspension of farm work and orange picking and in some sections retarded the growth of crops, but in other respects it was beneficial. Grain is in good condition and making fair growth, but would be improved by clear and warmer weather. With favorable conditions it is probable the wheat, oat and barley crops will be fully up to average and in some sections the yield will be the best for several years. Alfalfa is making good growth and heavy crops are probable. Work in hop fields is progressing rather slowly owing to frequent showers. Sugar beet planting continues. Hills and valleys are thickly covered with new growth and green feed of good quality is abundant. Stock are in prime condition and gaining flesh.

Many varieties of deciduous fruits are in full bloom and prospects are good for early and large crops. In some sections the rain caused slight injury to almonds and other trees in blossom. Strawberries are in bloom in the Sacramento valley and an early crop is expected. Vineyards and orchards are in excellent condition. Large shipments of oranges, lemons, and grapefruit are bing made from Southern California.

Eureka Sunmmary.—Warm, rainy weather throughout the week caused some fruit trees to bloom. Grain is in excellent condition and growing rapidly. Grass is also making satisfactory growth. Present prospects are good for abundant crops.

Los Angeles Summary.—All crops are in good condition and the outlook was never better. Range grass is growing rapidly. The hay crop is assured with a few later showers. Orange picking has been resumed since the rain. Deciduous and citrus trees are in general bloom.

TEST OF DEEP WELL PUMP.

During the past week the Pomona Manufacturing Company of Pomona, Cal., made a test of one of their deep well pumps installed for the Santa Anita Sand Co., of Santa Anita, Cal., a subdivision of the noted Baldwin ranch—comprising nearly 1000 acres.

This plant is one of several and is designed to furnish water for this tract for both irrigation and domestic use.

The water is raised from 200 to 250 feet below the surface and forced through over 500 feet of pipe into a reservoir 15 feet above the location of the pump.

Owing to the limited size of the well which is 12 inch the largest size working barrel that could be used was 9 inch and in order to deliver the quantity of water needed, namely 40 miners inches, it was necessary to operate the pump at a piston speed of 115 to 120 feet per minute, something quite remarkable in a pump 250 feet long, but the work was done without any vibration on the machinery or jerk or jar on the rods, and the plant worked remarkably smooth and the owners were not only pleased but delighted.

The test was witnessed by some of the best hydraulic engineers of this locality and members of irrigation companies such as Geo. D. Whitcomb of Glendora; William Bowring and W. A. Johnston of San Dimas and others.

Anyone wishing to see this plant operate can take the Monrovia car to Baldwin Ave., and go south 1-4 mile.

Anyone interested in this type of a pump would be well paid for their time and trouble in making the trip as it represents the newest and best design of machinery for this purpose, and in both strength and quality of workmanship is a way ahead of anything else.

Indian Runner Ducks are advertised by W. T. Taylor on another page.

LESS CLIPPER-CUT FRUIT

As the season will soon be here when citrus shipments will cause to come back reports of more or less decay the wise grower is casting about for a remedy.

We gave in the Cultivator some months ago a description and illustration of the Steffa Clipper which caused much favorable comment. This clipper has since been manufactured in large quantities and may now be secured of nearly all hardware men.

If unable to get them, write at once to E. P. Steffa, Pomona.

Round, smooth "points", curvature sufficient to permit close-cut stems and a protecting feature which absolutely prevents clipper-cut fruit are its features. *

The Maywood Colony Nursery of Corning, advertise the world famous fig and other nursery stock for sale in the Cultivator. Write for prices.
